COMPRISING

A COMPLETE SUMMARY OF THE MORAL, MATHEMATICAL, PHYSICAL, AND NATURAL SCIENCES;

A PLAIN DESCRIPTION OF THE ARTS:

AN INTERESTING SYNOPSIS OF LITERARY KNOWLEDGE;

WITH THE

PRONUNCIATION AND ETYMOLOGY OF EVERY LEADING TERM.

CONTAINING

NINETEEN HUNDRED AND EIGHTY COLUMNS

YZD

UPWARDS OF SIX HUNDRED ENGRAVINGS.

VOLUME I.

#### LONDON:

WARD, LOCK, & TYLER, WARWICK HOUSE,
PATERNOSTER ROW.

THE first "BEETON'S DICTIONARY OF UNIVERSAL INFORMATION" furnishes a full and satisfactory account of Geography, History, Biography, Mythology, and Biblical Knowledge, together with a reliable Chronological Record. Its readers are supplied with information as to every person in sacred and profane history to whom the attention of mankind has been drawn, as well as with a succinct account of every place upon the globe, of importance in a geographical, historical, or industrial sense. In brief, the first "BEETON'S DICTIONARY" supplies a vast body of facts in so far as they relate to the Names of Persons and Places.

In this second "BETON'S DICTIONARY" is given to the non-scientific and general reader a full and faithful account of the forces which animate Nature, and which are incessantly acting upon mankind,—of the elements of which all things are composed,—of inventions of every kind, and of every art and process to which the genius of man has given birth; in other words, here is presented an immense and interesting body of facts, in so far as they relate to Things.

There already exist, it must be admitted, a great number of works which are intended to meet this want, such as the Dictionaries of Language, or Lexicons, and the many large Encyclopædias of various kinds; but the first of these works, by the very nature of their plan, can only supply a bare definition of words, without penetrating into the nature of the things which those words designate. In the Encyclopædias, which are professedly published to accomplish that which is beyond the province of the Lexicon, long dissertations, complete technical treatises even, are given, rather than concentrated notices; the volumes attaining such vast proportions as to place them far beyond the reach of the great mass of the reading public. Too high in price, too slow in growth, too unhandy, unwieldy, and diffuse, these important tomes suggest a want that can only be supplied by such a work as this, which, without being as bare and unsatisfactory as the dictionaries of language, without being as bulky and expensive as the encyclopædias, nevertheless furnishes, in the closest, tersest, and most exact manner, the essence, the substance, the indispensable information upon each subject. By the employment of brevity of expression and a well-considered plan, this essential knowledge is collected into a single volume, cheap in price, portable in size, and convenient for reference; in a word, in a Practical Encyclopædia, where everything finds a place upon which something useful or profitable may be said.

In the compilation of the different articles in this Dictionary, a uniform plan is followed. Immediately after the name of each leading word there are placed its pronunciation and its etymology, to serve the double purpose of giving a clearer meaning to it, and as an aid to its remembrance. Next follows its scientific definition, an account of its essentials and characteristics, its divisions and usual classifications, its uses and appliances in Science, the Arts, or Literature. The article terminates, when there is occasion, with an historical notice, which gives an account of the origin and growth of each Science and Art, with the date of its discovery or first application. Finally, there are added to the principal articles bibliographical notices, which indicate the best works published on each subject.

As for the style, the very nature of the work demanded that the greatest number of facts should be grouped together in the fewest words,—that the motto should be Res, non verba. It was indispensable, then, that the style should be laconic, without ceasing to be clear; also, it was necessary that it should be scrupulously exact. No weak, periphrastic mode of expression would serve to give a proper and foreible description of a mineral, a vegetable, an animal,—of the analysis of a substance, or the demonstration of a theorem.

The natural terms, as written by mineralogists, botanists, zoologists, chemists, and mathematicians, are here used; but in such a way that the ordinary reader is enabled to understand them, without missing a shade of their meaning. Further, especial care is

Vi PREFACE.

taken, by means of cross-references, to explain in alphabetical order whatever terms might present any difficulty. Again, by the plentiful use of cross-references, the work is made more completely its own index than an Encyclopædia is in general found to be.

In order to insure harmony throughout this Dictionary, no less than to avoid those contradictions, omissions, repetitions, or false references, which too often disfigure works of the kind, it has been the duty of one of its editors to pay especial attention to those matters of detail—to revise all the articles, and to make all fit each other as the links of one chain.

It may be safely asserted, that this work, brought down to the latest stage of know-ledge, will be found to present a combination of that scientific, literary, and artistic information, which is, at the present time, regarded as the indispensable condition of any education pretending to be serious and complete.

This work has been compiled with the care demanded by its importance. The extraordinary impulse which scientific knowledge has received within the last quarter of a century,—the grand discoveries which have been made,—the marvellous applications to which these discoveries have been turned, have opened the eyes of the people to the truth of the declaration that "knowledge is power," and have caused the study of science to become especially attractive to the minds of the great mass of the community.

To meet, then, this desire for scientific knowledge is the aim of BETTON'S DICTIONARY." Collecting into an harmonious whole—into a single volume—all the precious information which is scattered through scores of learned treatises, or buried in the depths of vast encyclopædias, presenting it to its readers in the briefest, simplest, and most exact manner, this work brings within the reach of the many that knowledge which has too long been reserved for the few. To the general reader it gives a full definition of those technical terms with which he is constantly meeting in the newspapers, in the magazines, in conversation even, and which are, too frequently, enigmas to him. It gives an account of machines and processes he every day sees without comprehending. It recalls to the mind of the student, sometimes perhaps even to the expert, the elements and the essential properties of a chemical combination; the distinctive characteristics of a class or of an order in botany, in zoology;—it points out to the uninitiated the nature and classification of the animal kingdom; and, in medicine, it defines the symptoms of those diseases which assail mankind. If it is not possible for it to give an exhaustive reply to every question, it does, at any rate, thanks to its bibliographical notices, point out to the earnest inquirer the sources where he may obtain an abundant response.

Designed, then, like the "DICTIONARY OF HISTORY, BIOGRAPHY, AND GEOGRAPHY," to meet a real want, conceived in the same spirit, of the same form and proportions, executed by the same editors, with competent auxiliaries, the "DICTIONARY OF SCIENCE, ART, AND LITERATURE" becomes the inseparable companion of its predecessor. The two volumes, in a word, form the separate moieties of a complete whole,—each being incomplete without its fellow.

THE New Edition of this work has had bestowed upon it an amount of labour and care which was due to the important character of the original enterprise. Technical Education has become one of the most pressing necessities of our time; and the future of individual and national prosperity depends greatly on the diffusion of this kind of knowledge. The revising editor has been especially attentive in adding, amongst the new articles which appear in this work for the first time, every new and profitable subject in connection with the Useful Arts; and he has felt the same anxiety to incorporate, in articles which have before appeared, all the latest and most definite information. new feature, worthy of notice, the full-page engravings form, in the present edition, a collection of illustrations of the Arts and Sciences, of Natural Phenomena, and of other subjects included in the scope of the Dictionary, which will themselves testify to the unsparing cost and trouble which have been spent upon the present issue. Unique in its aim, alone in the fulness and clearness of its information, and fertile in the abundant mass of materials for thought and work, "BEETON'S DICTIONARY OF SCIENCE, ART, AND LITERATURE" has claims upon the public estimation which it has never failed to receive, and which the volume now completed will strengther and confirm.

### THE PRONUNCIATION.

In this volume the Pronunciation, printed in *Italics*, immediately follows each leading Term. This pronunciation is shown, for the most part, by a combination of letters about the sound of which there can be no doubt. Here follow, however, together with the sounds they indicate, such letters as might seem to require explanation:—

#### VOWELS.

Where	a is	used	 it is sou	inded as	•••	a	in bar, car, omega, Africa.
"	ă	,,	,,`	"		a	in can, fan, tan.
,,	à	,,	,,	,,		а	in fate, hate, late, gray.
,,	aw	,,	,,	,,		а	in fall, tall, wall; and
						0	in for, lord, sterm.
,,	E	"	,,	,,		$\boldsymbol{c}$	in get, let, net.
,,	ce	,,	"	,,		e	in greet, steep, weep.
,,	oi	,,,	"	,,		oi	in oil, broil; and
						oy	in coy, deploy.
,,	ou	,,	,,	,,		ou	in bound, hound, mound; and
						ow	in bow, how, now.

#### CONSONANTS.

Where ch is us	sed it	is sound	led as	ch	in birch, lurch; and
Ø				tcl	r in ditck, kitch.
,, g ,,		,,	,,	g	in gas, gone, big.
,, j ,;	,	,,	,,	g	in gentle, pigeon; and
				j	in jade, jet, jot.

### DICTIONARY OF UNIVERSAL

### INFORMATION.

A, the first letter of the alphabet in almost every A, the first letter of the alphaset in almose every known language (the only exceptions, probably, being the Rihiopic and the Runic; in the former of which it occupies the thirteenth and in the latter the tent place). This, doubtless, is owing to the great simplicity of its sound, it being the letter which is most easily and naturally uttered by the organs of speech. In the continental and Oriental languages it varies less than in Furtible Append the sea tleast four distinct sounds known English, where it has at least four distinct sounds, known as the long or slender, the broad, the short or open, and the middle; as in name, call, man, father. In Grammar, A is styled the indefinite article, and denotes one or any; s, a man. In Music, A is the nominal of the sixth note as, a man. In Music, A is the nominal of the sixth note in the gamut: it is also the name of one of the two natural moods, and is the open note of the second string of the violin, by which the other strings are tuned and regulated. In Logic, A denotes a universal affirmative proposition; and in Algebra, a, b, c are used to represent known quantities, while the last letters, x, y, z, are generally taken to denote unknown quantities. As a wareard of around the Greaks denoted 1, and with a numeral, a', among the Greeks, denoted 1; and, with a mark under it, a, 1,000. With the Romans, A was 500; and, with a short horizontal line over it, A, 5,000. 500; and, with a short horizontal line over it, Å, 5,000. In trials of criminal causes among the Romains, A signified absolvo, I acquit; and was hence called litera salutaris, the saving letter. When put to bills of exchange in England, A signifies accepted. A 1 is a symbol by which first-class vessels,—that is to say, vessels whose hull and equipments are in an efficient condition,—are known and registered at Lloyd's for a certain number of years after being built. A A A, in Chemistry, signifies amalgama, to mix; and in Pharmacy, ā, w āā, denotes that the proportions of the ingredients to which it refers are to be equal. A is frequently used as an abbreviation. (See Aubertylemon)

AAM, or HAAM, awm, a Dutch liquid measure, con

AAM, or HAAM, awm, a Dutch liquid measure, containing 288 English pints.

AARD-VARK, ard-park (Du. earth-pig), in Zool., a genus of animals which belongs to the class Mammalia, and to the ord. Edentata. It feeds upon insects and roots, and burrows in the ground. It is noturnal in its habits, and passes the greater portion of its time in eating and sleeping. Aard-Vark is the name given by the Dutch at the Cape of Good Hope to the Orycteropus capensis, a species now dissunited from the Myrmecophaga, or Ant-caters of Linnaus, with which it was formerly classed. It lives entirely upon ants, and in this respect resembles the Echidnes of Australia, the Myrmecophaga of America, and the Pangolius of Asia; fulfilling the same purposes in Southern Africa which these species fulfil in their respective countries. respective countries.

respective countries.

ARD-WOLF, and -woolf (Du. earth-wolf), a genus of digitigrade carnivorous mammals founded by Isidore Geoffroy St. Hilaire, and forming the link which connects the civets with the dogs and hyænas. It is an extremely singular animal, having externally the appearance and bone-structure of the hyæna united to

the head and feet of the fox, with the intestines of the civet. It was brought from Africa to Europe some years ago by the traveller Delalande. Its size is about that of a full-grown fox, which it resembles in both its habits and its manners, being necturnal, and constructing a subterraneous abode.

An, āb, in Hebrew chronology was the fifth month of the ecclesiastical and the eleventh of the civil year, and always contained thirty days. It corresponded to the latter part of our July and beginning of August.

ABACA, a'-ba-ca, a kind of flax or hemp grown in the Philippine Islands.

the Philippine Islands.

ABACISCUS, üb-a-sis'-kus, in Arch., a diminution of the term Abacus, only seldom used; but, when it is, chiefly applied to the tiles or squares of a Mossio pavement.

ABACK, &-bāk' (Ang.-Sax.), the situation of the sails when they are pressed against the masts by the force of the wind. Thus the sails are said to be "taken aback" when, by a change of wind or otherwise, they are placed in that position.

ABACCT, &b'-a-kot (deriv. uncertain), a cap of dignity,

formerly worn by the kings of England.

armenty worn by the kings of England.

ABACUS, &b'-a-kus (Lat. abacus, counting-table, level tablet, &c.), in Arch., a constituent part of the capital of a column, which supports the horizontal entablature. In the Tuscan, Dorie, and Ionic orders, it is flat and square; but, in the Corinthian and Composite orders, its four sides are arched inwards, with, generally, a rose in the centre. Vitruvius says it was meant to regre.

meant to represent a tile upon a basket, and attributes its invention to Callimachus, who, observinga bas ket covered with tile placed over the root of Αn acanthus plant(see Acan-THUS), was so struck with its

ABACUS.

appearance, that he imitated it in sculpture, by making appearance, that he imitated it in sculpture, by making the whole group the capital of a column, in which the tile was represented by the abacus, the growing leaves of the acanthus by the volutes, and the basket by the body of the capital. In Gothic architecture, the abacus was very variously employed, according to the fancy of the architect.

ABACUS, in Arith, is the name of an instrument employed in England to teach the elementary princi-ples of the science of numbers. The Pythagorean abacus is a term sometimes applied to the multiplica-

abacus is a term sometimes applied to the multiplica-tion table. The ancient mathematicians also employed the term abacus to designate a table covered with sand, upon which they traced their diagrams. Abacus, Chinese, or Shwan-Pan, shwun-Pan, is also an instrument for facilitating arithmetical calculations. It consists of several series of beads or counters strung upon brass wires stretched from the top to the bottom.

of an instrument, and divided in the middle by a crosspiece from side to side. In the upper compartment every wire has two beads, which each count for 5; in the lower space every wire has five beads of different values; the first being counted as 1, the second as 10, the third as 100, and so on. In this country, with our system of reckoning, such an instrument could not be made generally applicable to arithmetic; but in China, where the entire system is decimal, that is, where every weight and measure is the tenth part of the next greater one, the abscus is used with wonderful rapidity. A similar instrument was in use among the Greeks and the Romans; and the Russians calculate by strings of beads. In this country a chequer-board, such as is still sometimes to be seen langing out as a sign at the doors of public-houses, was formerly used as an abacus. There is also a chemical abacus, which, in 1839, was introduced to the notice of the British Association by Dr. Reid. It was designed to give to students a more accurate knowledge of the elements of which the more important chemical compounds are constituted. was constructed of a wooden frame with cross wires, upon which beads were strung. Each of the wires represented a chemical element, and each of the beads

represented a chemical element, and each of the beads an atom, while, at the extremittee of the wires, the names of the elements were placed.

ARAFT, or AFT, &-boff" (Ang.-Sax.), in Maritime language, signifies the hinder part of a ship; thus,—"abaft the main-mast," that is to say, between the main-mast and the stern. "Abaft the beam," signifies the relative situation of an object in some part of the horizon contained butween a line drawn at right sudges. horizon contained between a line drawn at right angles to the keel and the point to which the stern of the

ship is directed.

ABAGI, or ABASI, a-ba-jse', a Persian coin, of about the value of eighteen pence English.

ABAMDONMENT, d-bān'-dun-ment, a term made use of in marine insurances, where, prior to compensation being demanded for the loss of a ship or goods, the owner must abandon or make over to the insurer his

owner must abandon or make over to the insurer his entire interest in any portion of the rescued property.

Araser, or Araissi, a-baised (lowered), in Heraldry, a term borrowed from the French, and applied to the wings of eagles, &c., when the tip inclines downwards to the point of the shield, or when the wings are shut.

Arauser, a-baid-ment (old Fr. abater, to heat down, to destroy), in Law, a terps signifying the rejection of a suit on account of some fault either in the matter or proceeding. Hence, a "pleain abatement" is some exception alleged against the plaint may abate or cease. It is the rule, however, that he who takes advantage of a flaw to plead an abatement, must not advantage of a flaw to plead an abatement, must not advantage or a new to plead an abatement, must not only indicate the flaw in question, but likewise point out its remedy. When the plea of abatement is granted, all writs in the process must begin de nove. Both public and private nuisances may be peaceably "abated," or overcome. Thus, if a person be unlawfully annoyed or done damage to, it is a private nuisance, and he may abate or destroy the nuisance, provided he shall not disturb the public peace, nor inflict further injury upon the thing than is necessary to get rid of the nuisance which sanoys or damages him. An obstruction of a public road, such as a gate being thrown across it, constitutes a public nuisance. and a person may abate or overcome such nuisance, provided he does no more than is absolutely required for the accomplishment of his purpose. Coke, in his Comments upon Littleton, declares that it is "an abatement when a man dies seized of an estate of inheritance, and between the death and the entry of the heir a stranger doth interpose himself and abate."

stranger doth intespose himself and abate."

ABATHMENT, in Heraldry, is an accidental figure added to a coat of arms, to lessen its true dignity, and to indicate some stain in the character of the bearer.

ABATHMENT OF LEGACHS. (See LEGACY.)

ABATHS, OF ABATHS, a-ba-te', ā-bat'-tis (Fr. abattre, to knock down), a term used in Fortification, and signifying a work constructed of felled trees, placed side by side, with their branches, the stronger of which are left on, turned towards the enemy in such a way as to constitute a form of defence for the troops posted behind them.

ABATTOIB, ab'-ā-twor (Fr. abattre, to knock down), a term borrowed from the French, with whom it signi-

fles a slaughter-house. The Abattoir system was, in 1818, adopted in France. There are at present near Paris five immense establishments of this kind, where butchers are provided with a place for slaughtering their cattle and keeping their meat in store. There are also places for supplying the beasts with water, receptacles for the fat, hoofs, blood, brains, &c. In the neighbourhood of the abattoirs there are manufactories of blood-manure, gelatine, glue, and the other products of the offal. In most of the continental towns, and in several of the larger cities of the American Union, slaughter-houses are placed under similar regulations to those which are in operation in Paris. In 1851 a large and commodious abattoir was established in Edinburgh. In 1855 the great cattle-market, which in Edinburgh. In 1855 the great cattle-market, which had been held in Smithfield for upwards of 500 years, was removed to the north of London, where a new market was built upon an area comprising 15 acres of ground. This large inclosure is capable of containing 6,600 oxen, 1,425 calves, 900 pigs, and about 35,000 sheep. It also can give lairage to 3,000 oxen and 8,000 sheep, and has excellent slaughter-houses. This is the only approach as yet made to the abattoir system in London.

ABBA, ab'-ba, a Syriac term signifying father. Among the Jews, it was a title of dignity. The Christians of the East apply it to their bishops.

ABBA, &b'-bai (Fr. abbé), is the French term for an abbot. Before the Revolution, it was a title assumed by a proproposity and the statement of the st by a very numerous class of persons, who had little or no connection with the Church. Some of them were distinguished men of letters, or rose to eminence in the state; while many of them were engaged, less prominently, in public or private tuition.

ABBESS, ab'-bess (Fr. abbesse), the superior of an abbey or convent of nuns. An abbess exercises the same authority over nuns that an abbet does over monks, spiritual functions alone excepted. It was decreed by the council of Trent, that an abbess, before entering upon her functions, should have attained the

age of 40 years.

ABBEY, ŭb'-be (Fr. abbaie), a religious house, presided over by an abbot or abbess; when the superior was a prior, the establishment was called a priory; otherwise, there was little or no distinction between them. These houses were wholly abolished in England by Henry VIII., at the time of the Reformation. According to Bishop Tanner's "Notitia Monastica," 506 religious houses were then suppressed, the revenues of which amounted to about £132,000 per annum; but other authorities make their wealth much greater. In the early part of the French monarchy, dukes and counts, though secular persons, were termed abbots, in conse-quence of the possession of certain abbeys having been conferred upon them.

Amor, wh-tot (Ang.-Sax. abbod), the chief ruler of a monastery, or abbey of monks. The term comes from the Hebrew ab, through the Greek abba, father. At first abbots were subject to the bishops, and even to the pastor of the parochial district within which they were established. Afterwards, however, they assumed greater power, and aspired to even equal rank with the bishops, which led to frequent vexations disputes in the Church. Distinctions also arose among abbots;—as mitred, those privileged to wear the mitre, and exercise episcopal authority within their respective precincts; crosiered, so named from their carrying the crosier, or pastoral staff; ccumenical, such as exercised universal dominion; and cardinal, from their superiority over all others.

ABBERVIATION OF FRACTIONS, üb-bre-vs-ai'-shun (Lat. brevio, I shorten), in Arith., a term signifying the reducing of fractions to the lowest terms, a process which is performed by dividing both the numerator and denominator by any term which will divide them without leaving any remainder; thus, 12 becomes equal to 1/2, to 3, and, finally, to 3, if divided in succession by 2.

ABBERVIATION, the contracting of a word or some

ABBLEVIATION, the contracting of a word or sentence, by omitting some of the letters or words, or by substituting certain marks or characters in their place. Abbreviations were much used by the earlier writers. The Greeks and Romans largely employed them, and, most of all, the Jewish rabbins. At the present time they are chiefly confined to titles, dates, and a few

#### Abbreviation

phrases. Most of the arts and sciences, however, have sets of signs or abbreviations peculiar to themselves. The following is a list of the more important abbreviations in common use :-

A. Associate.

ABDICATION, üb-de-kai'-shun (Lat. abdice, I renounce, reject, refuse), in general signifies the renouncing or reject, rentsey, in general as signines one renouncing or giving up of any trust before the usual or stated time of holding it is expired; but it is commonly applied to the renouncing of regal power. It differs from resignation in that the latter is done in favour of some one, whereas the former is done anconditionally. Abdications occur most frequently in absolute governments, as we find among the Roman emperors, the sultans of Turkey, and the cars of Russia. By the English constitution the sovereign cannot abdicate except with the consent of the two houses of parliament. It has been held, however (as in the case of James II., 1698), that the sovereign may, by acting subversively of the constitu-tion, be regarded as having abdicated. In early times the most noted abdications were those of Sylla, the dictator (B.C. 79), and Diocletian, the emperor (A.D. 305). In more recent times we have the emperor Charles V. In more recent times we have the emperor Charles V. (1556); Christina of Sweden (1654); Philip V. of Spain (1724); Victor Amadeus II. of Sardinia (1730); Charles IV. of Spain (1808); Napoleon (1818); Victor Emmanuel V. of Sardinia (1821); Charles X. of France (1830); William I. of Holland (1840); Louis Philippe of France (1848); Louis Charles of Bavaria (1848); Ferdinand of Austria (1848); Charles Albert of Sardinia (1849). dinia (1849).

ABDOMEN, db-do'-men (Lat.abdo, I hide), in Anat., the belly, or lower part of the trunk, separated from the chest crupper part by the disphragm. It contains the stomach, intestines, liver, spleen, pancreas, kidneys, &c., stomach, intostines, liver, spieen, pancreas, sinueys, ac., and is lined within by a membrane called the peritoneum. For convenience of description, the abdomen is divided horizontally into three regions,—the upper, or epigastric; the middle, or umbilical; and the lower, or hypogastric. It may also be divided longitudinally by two lines, when the above terms are confined to the central portion, the epigastric having on each side the right and left bypochondriac, the umbilical, the right and left lumbar, and the hypogastric the right and left iliac.
Abdomen, in Ent., signifies the whole lower portion of
the body of an insect, united to the corselet, or thorax, by a thread.

ABDOMINALES, OF ABDOMINAL FISHES, ab-dom-i-nai'. ABDOMINALES, or ABDOMINAL FISHES, ac-aom:-nas-less, the fourth class of animals in the Linuman system. Charac. Ventral fins (those of the belly) placed behind the pectoral (those of the breast), in the abdo-men, and the branchize or gills ossiculated. The ar-rangement of Linumus is now, however, generally iiscarded, the term abdominales denoting a family or subdivision of malacopterygious or soft-finned fishes only.

ABDUCTION, ub-duk'-shun (Lat. ab, from, and duco, ADDUCTION, ib-duk'-shun (lat. ab, from, and duco, I draw), in Law, is the illegal carrying off of the person of another, whether of child, heiress, wife, or woman in general. If a wife be taken off, either forcibly or by fraud and persuasion, the husband may obtain damages for her abduction, and likewise from any person persuading or enticing his wife to live apart from him without sufficient cause. In the case of an abduction of ward, the guardian may recover damages from such
as take his ward from his keeping; but when the ward
comes of age, the guardian must account to the ward
for the damages received. If an heiress be taken away
for the damages received. If an heiress be taken away
for the purpose of either marriage or defilement, the

for life, with the heirs of D as inheritors, the inheritance

act becomes a felony, and the principal, or his aiders, abettors, or counsellors, may be punished by transportation for life, or not less than seven years. The abduction of a girl under 16 is a misdemeanour, the punishment of which is fine or imprisonment, sad if a marriage shall have been brought about by violence, it may be set aside on that ground. To carry eff and marry any womane by force is a felony, and in such a case, as well as in that of the abduction of an heiress, the rule that a wife may not be allowed to give evidence against her husband does not hold good, for these reasons,—that the prime ingredient in the marriage contract, the wife's consent, has been wanting, and likewise because it is an axiom of law, that "s man shall not take advantage of his own wrong." which would clearly be the case were a man, by forcibly marrying a woman, allowed thereby to prevent sier appearing as a witness against him. Sir Walter Scott, in his Notes and Introduction to Rob Roy, informs us that the crime of abduction was at one time an ordinary offence on the border of the Scottish highlands. dinary offence on the border of the Scottish highlands. (See Kidnapping.)

Anduction, in Logic, is a form of reasoning called by the Greeks apagoge, in which the greater extreme is contained in the medium; but the medium is not so evidently in the lesser extreme. Ex. Whatever God has revealed is certainly true: now God has revealed a future retribution; therefore a future retribution is certainly true. In the use of this kind of reasoning, the minor proposition must be proved to be contained

the minor proposition in us of proven to be constituted in the major, otherwise the reasoning is inconclusive. ABDUCTOE MUSCLES, ib-duk'-tor, a term given in Anatomy to those muscles which draw one part of the body from another; as adductor muscles are those which draw one part of the body to another.

ABBLE-TREE, ib-ee'-le, in Bot. called the Populus alba, a species of the popular, having very large leaves. ABELMESAK, a-bel-me'-sak, the musk-seed, which is grows in the West Indies and in Egypt, and which is used as a perfume.

used as a perfume.

ABERDEVINE, cb-er-de-vine, a song-bird, sometimes called the Siskin. It is the Carduelis spinus of Cuvier, and resembles the green variety of the canarybird, with which it is often paired, to produce what are called mule birds. In its habits it is migratory, breeding in the north of Europe, and visiting Germany, France, and Britain, only in the autumn and winter.

ABERGATION, cb-er-ai-shun (Lat. cb, from, and erro, I wander), a term applied to three highly-important optical plenomens:—1. Abergation of Light, in Astronomy, designates a small apparent displacement of the fixed stars. It arises from these combined causes,—the progressive movement of light (travelling at the rate of 195,000 miles per second), and the movement of the earth in her orbit. Its effect is to give the fixed stars an apparent movement in space around their of the earth in her orbit. Its effect is to give the fixed stars an apparent movement in space around their true place. The discovery of this remarkable fact was made in 1727, by the illustrious English astronomer Dr. Bradley; and it is one that affords aft incontrovertible proof of the motion of the earth around the sun.—2. Aberration of Sphericity designates that deviation of the rays of light which takes place after they have passed through a curved lens, whereby the rays, instead of being collected into a single point, are extended over a small space; thus giving a rather confused image of the object. This deviation is due to the apherical form of the lens itself.—3. Aberration of the frangibility is the term applied to that dispersion of the rays of light which happens after they have passed through a lenticular glass, and in consequence of which a variegated ring of colour is seen encircling the image, and thereby rendering it a confused one. the image, and thereby rendering it a confused one. This defect has, however, been remedied by the in-

ADECTOR AS DOWNER, DEED TEMPORADE OF UNDERSON WHICH ADDRESS OF SELECTION ADDRESS OF SELECTION ADDRESS OF SELECTION AS A DESCRIPTION OF A DESCRIPTION AS A DESCRIPTION OF A DESCR is treated as a principal; if absent, as an accessary before the fact.

#### Abies

remains in abevance until the demise of D, as it is impossible that there can be an heir to a living person.

A peerage is held to be in abeyance when the next inheritors are several females.

Adules, at bi-see (Lat. abies, the fir-tree), in Bot., a nus of plants included in the natural order Conifera, or cone-bearing family. Several species of this genus are valuable timber-trees; as Abies excelsa, the spruce are valuable theoreties; as Loves Livesus, the spince fir; A. alba, the white sprace; and A. canadensis, the hemlock sprace. The resins and gum-resins which these trees exude are extensively used in the arts. The sprace fir produces common frankineense, from which spruce ar produces common frankineense, from which Burgundy pitch is prepared; the balm of Gilead fir (A. balsamea) yields Canada balsam; the silver fir (A picea), Strasburg turpentine; and the common larch (A Larix), Venice turpentine. Essence of apruce, used in the preparation of spruce beer, is formed by boiling the shoots of A. nigra, and some other species, in water, and afterwards conventioning the description. in water, and afterwards concentrating the decoction.

ABIETINE ai-bi'-e-tine (Lat. abietarius, connected with firs), the neutral resin obtained from Strasburg turpentine and Canada balsam. It is insoluble in water, soluble in alcohol. Its chemical formula is not

ABIETINEE. (See CONIFERE.)

ABJURATION, OATH OF, &b-ju-rai'-shun (Lat. ab, from, and juro, I swear), a form of oath originally imposed by statute 13 William III., and regulated by 6 George III., by which the juror acknowledged the right of the present royal family of Eugland to the right of the present royal family of England to the crown, under the Act of Settlement. He who took this oath further promised to support the monarch to the utmost of his power; engaged to disclose all plots against him; and declared that the descendants of the Pretender, or son of James II., had no right to the crown of England. The oaths of abjuration were generally required to be taken at the same time with the oaths of allegiance and supremacy; but all these oaths have now been reduced to a single formula of a much simpler character than they formerly possessed.

ABJURATION OF THE REALM, in Law, means the taking of an oath, by which the juror engages to retaking or an oath, by which the jurof engages to re-nounce and quit the realm for ever. Popish recusants, or those who refused to acknowledge the supremacy of the king of England as head of the Church, were in former times constantly being called upon to take the eath of abjuration of the realm; but by the statute 31 George III., made in 1791, the Roman Catholics were relieved from this as well as other penal restrictions .-Abjuration signifies, likewise, a public and solemn recantation of opinion. The "abjuration of heresy" was an act frequently required by the Roman Catholic church. History affords several examples of this act. Henry IV. abjured the Protestant religion on ascending the throne of France, in 1593; the queen of Sweden abjured her religious opinions in 1655; Turenne in 1688; and Augustus II. of Poland in 1706. Galileo was obliged to abjure his philosophical opinions by the Inquisition in 1633.

ABLATIVE, ab'-la-tiv (Lat. ablatus, taken away), the and given to the sixth case of nouns in Latin; so called from its implying "taking from," or "carrying away." The ablative absolute is applied to a noun occurring with a participle, independent of any other part of the sentence, and hence put in the ablative.

Any new Many course it has been controlled in the control

ABLUENT MEDICINES, ab-loo'-ent (Lat. abluo, I wash away), a term formerly applied to those medicines which are used for purifying the blood.

ARLUTION, db-lu'-shun (Lat. abluo, I wash away),

ARLUTION, do-tut-skun (Lat. actua, 1 wasu away), signifies, in a general sense, the washing or cleansing by water. The washing of the body, as being a fit emblem of purification, as well, doubtless, as from its importance in a sanitary point of view, came to form a more or less important part in almost every form of religious worship. It was enjoined in the Jewish and the construction of the sanitary point of the sanitary and t economy, and we find our Saviour repeatedly censuring the excess to which it was carried by the Pharisees. In Mohammedanism and the religious of India ab-

In Mohammeanism and the religions of India ac-lution occupies a very important place.

Annormal, id-nor-mid (Lat. ab, from, and norma, a rule), in Bot., a term applied to serial roots, like those of the mangrove, which help to support the stem.

ABOARD, id-bord', in Mar., signifies within the vessel.

Also, when a ship gets foul of another, she is said to be "aboard" of her.

#### Abridgment

ABOLITION, db-o-liek'-un, in parliamentary language, signifies the repealing some statute or usage.

ABOLITION OF BLAYERY. (See SLAYBEY.)
ABOLIA, d-bol-la (Lat. abolla, a closk or garment without sleeves), the name of a loose woollen closk worn by the Greeks and Romans. It was a smaller garment without sleeves) and some state of the state worn by the creeks and homans. It was a smaller gar-ment than the togs (see Tosa), and very closely resem-bled the pallium (see Pallium). It was festened under the throat, or upon the shoulder, by a fibula or clasp. ABOMA, 4-bo ma, a species of large serpent, inha-biting the morasses of South America. It will be found described under Boa.

ABOMIVE, a-bor'-tiv (Lat. abortio, untimely birth). In Bot, the essential part of the stamen is the auther, and when this is absent the stamen is said to be abortive. The general term abortion is applied to the suppression or new development of any organ.

ABOU-HANNE, a-boo' han'-nes, an African bird, considered by some naturalists to be identical with the ancient ibis. Although solitary in its habits, it is sometimes seen in small bands of from six to ten, and is capable of a lofty and powerful flight. It has some resemblance to the curiew found in Britain, but has resemblance to the curiew found in Finance, but men to been observed to run. In Egypt it is called by the inhabitants Abou-Menzel, which literally signifies "Father Sickle-bill," from the curved resemblance which it bears to that implement. The Ethiopie name, which it bears to that implement. The Ethiopic name, however, is Abou-Hannes, which means "Father John," and which, according to M. Dumont, is supposititiously applied to it because it arrives in Ethiopia about the day of St. John. The ibis, although so much associated with Egypt, does not breed in that country, but arrives as the waters of the Nile begin to rise, and disappears when these subside.

Abour, &-bour, in nautical language. signifies the

ABOUT, about, in nautical language, signifies the alteration of a ship's course. In military language, "about" means a change in the position of a body of troops. "Right about" and "left about" are commands given to execute semicircular turns to the right or the left.

ABBACADABBA, ab-ra-ka-dab'-ra, the name of an Assyrian god, which was formerly believed to have the power of curing diseases, especially slow and intermit-tent fevers. To accomplish this, the word was to be written many times in the form of a magical triangle,

> ABRACADABRA ABRACADABR ABRACADAB ABRACADA ABRACADA ABRACA ABRAC ABRA ABR A B

In modern times the term is for the most part used only in jest, without any particular meaning, like hocus-

ABBAMIS, a-brai'-mis (Gr. abramis), a sub-genus of malacopterygious or soft-finned abdominales, of which the bream is a species.

the bream is a species.

ABKANCHIANS, d-rbdn-'-ks-ans (Gr. a, without, and branchia, gills), an ord. of Anellidians, so called because they possess no organs of respiration.

ABKANSAS, d-brdz'-as, a term used by the Gnostics, a philosophical sect, who, in the early ages of Christianity, endeavoured to reconcile the doctrines of Paganism with those of Christianity. It signifies the Supreme Being, under whom they placed 365 dependent delities

ABRAKAS, a genus of nocturnal Lepidoptera, in which is included the common magpie-moth. Its colour is a yellowish white clotted with black, and a band of pale orange marks the wings. It deposits its eggs on the leaves of the ourrant and gooseberry in July or August, and the caterpillars are hatched in September. Its chrysalis is black.

brysalis is black.

ABREAST, a-brest (Ang.-Sax.), in maritime language, denotes the situation of two ships when they lie parallel to each other. Ships are spoken of as being "abreast" of a place when they are directly opposite

ABBIDGMENT, a-bridj'-ment (Fr. abrégement), in Lit.

much the same thing as an epitome or compendium of a large work. The excellence of an abridgment lies in taking only what is material and substantial, and rejecting what is superfluous either in sentiment or style. In Law, it is the shortening of a count or declaration.

ABROMA, 3b-ro-ma, in Bot., a genus of tropical plants in the Byttneriacea, or Chocolate order.

ABROY, 3b-rupt (Lat. abrumpo, I break off), in Bot., a term applied to any main root which ends

Bot., a term applied to any main root which cause abruptly, as though the point had been bitten off.

Arrey, of both (Gr. obros, elegant), in Bot., a genus of leguminous plants. The seeds of the Abrule precatorius are used as beade for making rosaries and necklaces: they are of a bright scarlet colour, with a black

mark on one side.

ABSCESS, ab'-sess (Lat. abscedo, I separate), the ABSCESS, difference (Lat. absecto, I separate), the name given in Surg., to an accumulation of pus, or matter, in some tissue or organ of the human body. The pus is formed from the blood during the process of inflammation, and the production of it is termed suppuration. When an opening is formed in an abscess, and matter still continues to be discharged from it, it is styled an ulcer. There are few tissues or organs of the body in which abscesses may not form. Abscesses in some organs are comparatively uninvortant. scesses in some organs are comparatively unimportant; in others they are highly dangerous.

ABSURS, or ABSURSA, äb-sus'-a (Lat. abscindo, I cut off), in Geom., a term signifying a segment cut off from a right line by an ordinate to a curve.

ABSCISSION, ab-siz'-shun, in Rhet., a figure of speech by which the orator breaks off suddenly, in the middle of a sentence, or of his discourse, to make the deeper impression on his audience.

Absentee, db-sen-tee', in Polit. Econ., is a term applied to a person who derives his income from one country, but who resides and expends it in another. Whether the absence of a landlord be injurious to a country in an economical sense is a question which has been much debated of late years, more particularly in connection with Ireland. Some maintain that the amount which a landlord spends in a foreign country is so much clear loss to the country from which he derives his income, and so much encouragement withdrawn from its industry. Others, again, assert, that, in point of fact, the revenue spent by a landlord in a foreign country has precisely the same effect upon the industry of his own country as if it were expended at home. They argue, that an Irish landlord residing in Paris receives his remittances of rent in bills of exchange which represent the value of British goods imported into France; that the money, instead of being with-drawn from the country, is expended in the production of Irish goods suitable to the English or foreign narket; and that thus a wider field of industry is developed for our native productions. The truth seems to lie between the two. Though it is not true that the whole revenuespentout of acountry is so much clear loss to that country, yet there can be little doubt that it has a prejudicial effect. The profits of the foreign retailers, servants, and others, remain at least in the foreign country, and are so much sharacted from the absen-tee's country. But there is a higher point of view in which this subject is to be regarded; namely, the moral. The evils here are undeniable. It is the duty of the proprietor to regard the interests of his tenants, to set before them a good example, and to sid them in effect-ing local improvements.—Ref. McCulloch's Treatise on Reonomical Policy.

Absintains, & d.-sin' thene (Gr. a without, and psin-thes, pleasure), & crystalline principle obtained from the Artemisia Absinthium, or wormwood, an herb used in the preparation of absinthe and other liqueurs.

(See ARTEMISTA.)

ABSIS, or AFSIS, ab'-sis (Gr. apsis, an arch), in Arch., a term used by the ancient ecclesiastical writers to denote that part of a sacred edifice where ar was erected, or where the clergy took their It was thus called on account of its having the altar was erected, generally a domed or vaulted roof.

generally a comed or valued roor.

ABSOLUTE, The, the so-lute (Lat. absolutus, adequate, that needs no addition), in Metaphysics, is a term employed to indicate that which exists without limitation of any kind. Another term, of the same meaning, is the Unconditional. The Absolute

Absorption

stands opposed to the Relative or Conditional. lute truths are truths which are necessary and universal, such as the axioms of mathematical science, and, in the estimation of certain schools of thought, the first principles of theology and morals. It is chiefly in Germany that the belief in such absolute truths exists. The English mind has always leaned in a contrary direction; and the greater number of English metaphysicians have believed in the relative or conditional nature of all truth whatsoever. Many thinkers, however, of the first order, have endcavoured to seek a Universal Postulate, i.e., a truth so self-evident as to require no illustration, the latest effort of the kind in this country being that of Mr. Herbert Spencer, in his treatise on "Psychology."

ABSOLUTIES, ABSOLUTIES, in Pol., a form of government in which the supreme head or sovereign is above

the control of the law, and enjoys unrestricted power.

(See DESPOTISM.)

ABSOLUTE NUMBER, is the known quantity which possesses one side of an equation; thus, in  $x^2 + 12x = 24$ , the absolute number is 24, which is equal to the

square of x added to 12x.

Ansolution, &bso-lu'-shun (Lat. ab, from, and solvo, I loose), in Civil Law, is an acquittal or seutence of a judge declaring the accused innocent of the crime laid to his charge. In Canon Law, it is a remission of laid to his charge. In Canon Law, it is a remission of sins pronounced by a priest in favour of a penitent. It is said that down to the 12th century the formula of absolution was, "May God," or "May Christ absolve thee," when it was changed into "I absolve thee from thy sin," the priest thus assuming to himself the thy sin," the priest thus assuming to himself the power to forgive sins. This is still the doctrine of the Roman Catholic church, sanctioned by the council of Trent, and grounded on John xx. 23. The form that occurs in the Church of England Order for the Visitation of the Sight of Theolic that form all the prime. tion of the Sick, "I absolve thee from all thy sins," is held to be only declaratory of the sinver's pardon upon the apparent evidences of a sincere repentance, and according to the best judgment of the priest. In the early church there were held to be five kinds of absolution,—sacramental, by haptism and by the eucharist; declaratory, by word of mouth and doctrine; precatory, by imposition of hands and prayer; judicial, by relaxation of church censures

relaxation of charch censures.

ABSORDERTS, db-sorb'-cats (Lat. absorbeo, I suck up),
a name given in Anat. to certain small delicate vessels which imbibe fluids that come in contact with
them, and carry them into the blood. They are denominated lacteals or lymphatics, according to the liquids which they convey.

ABSORDERTS, in Med., substances used to absorb or neutralize the acids sometimes formed in the stomach: chalk and magnesia are examples. In Surg., spongy substances used in dressing wounds, such as lint and

ABSORBENT GROUND, a term given in Paint. to a water-colour mixture, which is laid upon the canvas or wood, and, which, upon the oil-colours being applied, at once imbibes the oil, leaving the colours in which the design is made dry and brilliant.

ABSORPION, db-sorp'-shun, is the interpenetration of certain bodies by other bodies or influences, which

by this means disappear or become lost. There are several important examples of this in Physics.

several important examples of this in Physics.

Ansorption, in Bot., the chief function of the root, by which food is taken up in a state of solution for the uses of the plant. (Sce Endonnose.)

Ansorption, in Chem., the disappearance of a gaseous fluid on entering into combination with a liquid or solid; thus, when the gas, ammonia, is passed into water, absorption takes place, and the result is the liquid commonly called spirits of hartshorn.

Ansorption, in Physiol., a term employed to designate that natural function of the body which is exercised by the absorbent vessels; as the absorption of the chyle by the lacteal vessels.

ADSORPTION OF HEAT is where the heat-rays seem to disappear within the substances of bodies subjected to their influence, the effects differing greatly according to surface and colour. As this subject is closely connected with the phenomens of radiation and reflection, it will be considered at greater length under the ABSORPTION OF LIGHT will be best explained by

#### Abstinence

considering the causes of transparency, opacity, and colour. Transparency in a body is caused by one part of the light striking on it being transmitted through its substance, another being reflected from its surface, and a third being absorbed or lost is its interior. When a body reflects the whole of the light, it is said to be opaque, in which case, however, a small portion is absorbed. Colour is produced in transparent media by part of the colour contained in white light being absorbed. For example, a piece of blue glass absorbs the ned and yellow ravs. and transmits the blue: a absorbed. For example, a pace of blue glass absorbs the ned and yellow rays, and transmits the blue; a piece of orange glass acting just in a contrary manner, transmitting the red and yellow rays and absorbing the blue. The same thing happens with opaque-coloured bodies, with the exception that the unabsorbed ray is reflected instead of being transmitted. In a white opaque object, nearly the whole of the white lightis reflected from its surface, a small portion being absorbed without any separation of the coloured rays absorbed without any separation of the coloured rays In a black opaque object nearly the whole of the white light is absorbed without suffering any change. No light is absorbed without suffering any change. No object is absolutely transparent or opaque, even air absorbing a small portion of light and colour, and gold and silver transmitting green and purple rays respectively, when procured in sufficiently thin films. Ferfect absorption or reflection is also unknown, for the darkest substance reflects a little light,—otherwise it would be invisible; and the brightest speculum metal absorbs as infinitesimal portion. Philosophers are as absorbs an infinitesimal portion. Philosophers are as yet in ignorance of the causes of absorption of light; several theories have been propounded, but they appear only to make the matter still more difficult of comprehension.

ABSTIMENCE, ab'-sti-nense (Lat. abstineo, I abstain), the act or habit of refraining from something to which we have a propensity, or in which we find pleasure; but it is more particularly applied to the privation or sparing use of food. Abstinence has been enjoined and practised for various ends, as sanstory, moral, or religious. Physicians relate wonderful cures effected by abstinence; moralists, as the Pythagoreans, Stoics, and others, recommend it as a means of bringing the animal part of our nature into greater subservience to the spiritual; and it is likewise enjoined by various religious sects. It was commanded to the Jews; and, when among the primitive Christians a dispute arose upon this subject, the apostle Paul gave his opinion of the Romans xiv. 1—3. In England, abstinence from flesh on certain days has been enjoined even since the Reformation, and was renewed under Elizabeth; but Neiormation, and was renewed under Engapeth; but it was then expressly declared to be a political law, to favour the consumption of fish, and to multiply the number of fishermen and mariners.— Ref. English Cyclopædia—"Arts and Sciences." •

ABSTRACT MATHEMATICS, Or PUES MATHEMATICS, bit-stract (Lat. abstralo, I withdraw), signifies that branch of the science which deals with magnitude, force of the science which deals with magnitude, force of the science which deals with magnitude,

figure, and quantity in general, and without reference to any particular magnitude, figure, or quantity, Abstract Mathematics is opposed to Mixed Mathematics, which deals with the application of mathematics

ABSTRACT NUMBERS, in Arith, a term which signifies numbers considered in themselves, and without being applied to any individual thing,—as 4, 8, 12, &c.,—in distinction from numbers applied, or in the

concrete,—as 4 men, 8 feet, 12 ships, &c.

ABSTRACTION, ab-strak'-shun, in Psychol, this name is given to that operation of the mind by which it takes so given to that operation of the mind by which it takes cognisance of qualities separately from the thing in which they exist; as, for example, of whiteness, apart from snow, from lime, from milk, or from any other substance or liquid. "An abstraction" is the idea which substance or liquid. "An abstraction "is the idea winon is the result of the above process;—an abstract idea, which, however fugitive in itself, speedily clings to a word, and becomes incorporate with it. The question whether abstract ideas, such as Beauty, Truth, Time, Space, have any real existence, or are only forms of things and wholly relative, is, and always has been, the great bone of metaphysical contention. It was the point in dispute between the Realists and Nominalists of the Middla Assa and still divides thinkers into two crosses.

#### Acalepha

thing asserted, by demonstrating that the contrary is impossible, or leads to an absurdity. It is much used

impossible, or leads to an absurdity. It is much used in geometry.

ABUNDANT NUMBERS, &-bun'-dant (Lat. ab from, and unda, a wave), in Arith., are those numbers the aliquot parts of which, added together, make more than the number itself: thus, the aliquot parts of 20 (1, 2, 4, 5, 10), on being added together, make 22.

ABUTILON, ā-bu-te-lon, a genus of plants, belonging to the natural order Malvacea. The most interesting species is the Abutilon esculentum, commonly called Bençao de Deos, the flowers of which are boiled and eaten as vegetables in Brazil.

ABUTMENT, ā-but-ment (Fr. aboutir, to abut), in Arch., a term signifying the pier from which an arch springs, when the arch is less than a semicircle; but when an arch of any other figure is supported by but when an arch of any other figure is supported by a pier, which forms a right angle with the water or ground beneath, it is termed an impost-pier. The piers of Waterloo and London bridges are impost-piers; those of Southwark and Vauxhall are abutments. The extremities of a bridge, resting on the sides of a river, &c., are always termed abutments.

ABUTTALS, ā-but-tals (Fr. abutter, to bound or limit), the boundaries or limits of lands. These boundaries or abuttals are, in the case of corporation and church

lands, preserved by an annual procession.

Anyss, a-biss' (Gr. busses, profound depth), a term
the decident of the session of able; and in a figurative sense, it implies hell, or the bottomless pit.

ABYSSIMIAN CHURCH, in Eccl. Hist., the name of a sect of the Christian church established in Abyssimia. It is said, that about the beginning of the 4th century of our era, Meropius, a learned Greek of Tyre, when on a voyage of discovery, had landed on the coast of Abyssinia. Here he was attacked by the natives, and himself and crew murdered, with the exception of two youths, Framentius and Eddssius. These rose into great favour and influence in the country, and Frumentius was subsequently made bishop of Auxumas (the chief city of Abyssinia) by Athanasius, and laboured with great success. At present, the forms and ritual of the Abyssinian church are a strange compound of Judaism and Christianity, of ignorance and superstition. It is governed by a bishop, who is styled abona, and is sent into Abyssinia by the Coptic bishop of Alexandria. The Abyssinians have, at different times, expressed a desire to be reconciled to the church of Rome.

to be reconciled to the court of Rome.

ACACIA, "k-ka'-\*-k--\*, in Bot., a genus of plants, belonging to the natural order Leguminosa, sub-order Mimosa. Many kinds furnish good timber and valuable gums. The Acacia vera yields gum arabic; and the inner wood of the A. Calcehu, an Indian shrub, affords a bird of acacha was match, which is tarnism which is

inner wood of the A. Catechu, an Indian shrub, attords a kind of catechu, or cutch, rich in tannin, which is used for tanning, and, in medicine, as an astringent.

ACADEMY, & & Lad' - e-me, was the name of a place in the suburbs of Athens, laid out in walks and shady trees, and said to have been so called after its possessor, Academus or Ecademus. It became a favourite resort of the lovers of meditation and philosophy, and hither Socrates was wont occasionally to repair, to converse with his disciples. But it is chiefly in connection with Plato and his philosophy that the place has become famous; and hence his followers were termed Academics. In modern times, the term "academy" has come to have a somewhat different signification from that which it bore in angient times. It is generally applied to a society of learned men, formed for the cultivation of science, literature, or the arts. ACADEMY FIGURE, in Paint, a term used to signify a design, generally executed with black and white chalk, after a living model.

ACALEMENT A. Academy of the control of the control

ACALEPHE, a-ka-le'-fe (Gr. akalephe, a nettle), a class of marine invertebrate animals, comprehended in the sub-kingdom Radiata, and otherwise called Seanettles. It embraces an extensive number of animals, of which the genus Medusa of Linnsons may be taken Middle Ages, and still divides thinkers into two great as the type. This genus has a nervous system and schools. (See Prisonification.) Absurbum, Reduction AD, the still divides the truth of the a mode of argument which proves the truth of the

rated into four families,-the Pulmograda, the Ciliograda, the Cirrhigrada, and the Physograda. These families exhibit a great variety of genera of peculiar structure and form. Some of them are extremely beautiful, and present an interesting study to the naturalist. (See Jelly Fish and Medusa.)

the Acan ACANTHACER, a-kan-thai'-se-e, in Bot., thus order. Herbs or shrubs found in most parts of the world, and abounding in the tropics. Many species have very beautiful flowers. The elegant lobed and sinuated leaves of the acanthus are stated to have singgested the capital of the Corinthian pillar. (See CAPITAL.)

ACANTHION, a-kan'-the-on, in Zool., a genus of Rodentia known, at present, only by their osteology.
The genus was established by Cuvier.

The genus was established by Cuvier.

ACARTHODERMA, ā-kān-tho-der'-ma, a fossil genus of fishes, from Glaris.

ACANTHODES, ā-kān-tho'-dees (Gr. akuntha, a point; odons, a tooth), a genus of fossil-Ganoid fishes, found in carboniferous strata, near Edinburgh, Scotland.

ACANTHOPHIS, ā-kān'-tho-fis, in Zool., a genus of venomous serpents, allied to the vipers. From these, however, they are distinguished by their having a single series of plates beneath the tail. excent towards the series of plates beneath the tail, except towards the very end of it, where, in some instances, these are separated in two small rows. They are viviparous, and conceal themselves among the roots of trees, depending for their prey on the effects of the poison with which they are imbued.

ACANTHOPTERYGII, ŭ-kŭn-thof-te-ry/-ge-i, one of the three natural orders or primary divisions of fishes, divided by Cuvier into fifteen natural families.

divided by Cuvier into fifteen natural families.

ACANTEURUS, d-kăn'-thu-rus, in Nat. Hist., a genus of fishes, of the order Thoracici. Charac. Teeth small, in most species lobated; tail aculeated on each side. It is a native of the Indian and Arabian seas, in the latter of which it is generally seen in large shoals of two or three hundred each, swimming with great strength, and feeding principally on different kinds of sea-weed. The genus contains a large number of species, many of which are extremely beautiful both in form and colour.

number of species, many or which are the string both in form and colour.

ACANTHUS, &-kin'-thus, in Bot., a genus of herbaceous plants, belonging to the order Acanthacea (which see). Most of the species are tropical, but two grow These are Acanthus molis,

ocous planes, but of the species are tropical, but wild in Central Europe. These are Acanthus mollis, wild in Central Europe. These are Acanthus mollis, which has emollient qualities, and A. spicatus.

ACARUS, did-d-vas (Gr. akari, a mite), the tick or mite, a genus of insects of the order of Aptera, or those without wings. It is oviparous, has eight legs, and two jointed tentacula. It will live many tabes without wings. It is oviparous, has eight legs, two eyes, and two jointed tentacula. It will live many months without food, and is very prolific. Of the species, there are, the domestic mite, the iteh mite, the sugar-mite, the red spider, the sparrow-mite, the water-mite, and the ticks.

ACATALECTIC, a kāt-a-lek-tik, a term applied in Ancient Poetry to such verses as have all their feet and

sellables without any defect at the end; those which are not so, being called catalectic.

ACALLESCENT, ā-kawi-cs-sent (Gr. a, without, and kaulos, a stem), in Bot., a term applied to plants having very short or inconspicuous stems, as the sweet violet

ACCALIA, &k-kai'-le-a, festivals held among the Romans in honour of Acca Laurentia, the nurse of Romulus.

ACCREBATION, äk-sel-le-rai'-shun (Lat. acceleratio, hastening), in Mech., is when the velocity of a moving body is continually increased. With whatever velocity a faling body mores in the first second, it will, at the end of two seconds, move with twice that velocity, and so on; the force of gravity increasing as the body spproaches the earth. This is, however, not mathe-matically true, as it it is it is lost through the in-creased density and consequent resistance of the air at

ACCELERATION OF THE STARS, a term applied in Ancient Astron. to the time by which the fixed stars anticipate the diurnal motion of the earth.

ACCELERATION OF THE MOON is the increase of the moon's mean motion from the sun, compared with the diurnal motion of the earth, which is calculated at about ten seconds in a century.

ACCELERATION AND RETARDATION OF THE TIDES

are certain irregularities in the difference between the times of high water, which difference would be constant supposing the tides occurred at regular intervals. The tides are caused by the attraction exercised by the sun and moon on the waters of the earth. The earth being nearer to the moon than to the sun, it is by her The earth that the greatest influence is produced. The moon takes 24 h. 50 m. to perform one revolution round the earth; high water ought, therefore, to strive at exact intervals of 12 h. 25 m. This interval is, how-The moon . ever, continually changing at different times and places, being influenced by three principal causes, the relative distance of the sun and moon, of the earth and moon, and the moon's distance from the equator and moon, and the moon's distance from the equator. Local circumstances, such as currents, prevailing winds, &c., are other causes of these irregularities. For instance, high water takes place at Ipswich at nearly the correct time; at Glasgow and Greenock too early; and at most other places too late. The proper recurrence of spring and neap tides is at the conjunction and opposition of the sun, and is also irregular. At London the highest spring tide occurs 2 days 10 hours after the proper time; this error itself being liable to the greatest irregular.

irregularity.

ACCENT, ak'-sent (Lat. ad, to, and cano, I sing), among grammarians, is the raising or lowering of the voice in pronouncing certain syllables of words. There are three kinds of accents; viz., the acute, the grave, and circumflex. The acute accent, marked thus ('), shows that the voice is to be raised in pronouncing the syllables over which it is placed. The grave accent is marked thus ('), and points out when the voice ought to be lowered. The circumflex accent is compounded to be lowered. The circumflex accent is compounded of the other two, and marked thus (') or ('); it denotes a quavering of the voice between high and low. Some call the long and short quantities of syllables, accents;

ACCENT, in Music, signifies a raising of the tone, in order to obtain variety and expression.

(See BILL OF Ex-ACCEPTANCE, ak-sept'ans. CHANGE.)

CHANGE.)

ACCESSARY, or ACCESSORY, ik'-ses-so-re, or ik-ses'so-re (Lat. accedo, I approach), in Law, signifies one
who is guilty of a felonious offence, not principally,
but by participation. There are two kinds of accessories,—"before the fact" and "after the fact." An
accessory "before the fact" is he who, "being yet absent
at the time of the crime committed, doth yet procure, counsel, or command another to commit a crime." An accessory "after the fact" is one who receives, assists, or relieves a felon of whose guilt he has knowledge. (See LAW, CRIMINAL.)

ACCESSARY, Or ACCESSORY (Fr. accessoire), a term used in Paint., to eignify those things introduced into a picture for the purpose of explaining and helping the principal objects in telling the story. The works of Hogarth furnish excellent examples of the advantages to be derived from the employing of accessaries.

ACCESSION, dk-sex-shun (Lat. accessor, going to or towards), in International Law, signifies the act of a power when it becomes party to a treaty concluded between other powers. It also means the period at which a prince assumes the sovereignty. In Med., it

is synonymous with paroxysm.

Accidens, äk\*-se-dense (Lat. accidens, falling), a small book containing the first principles or rudiments

of grammar.

ACCIDENT, dk'-se-dant (Lat. accident, falling), notes, in a general sense, any casual event. Among logicians, it signifies,—1. Whatever does not essentially belong to a thing; 2. Such properties in any subject as are not essential to it; 3. In opposition to substance, all qualities whatever are called accidents; as sweetness, softness, hardness, &c. In Grammar, accident implies a property attached to a word without entering into its essential definition.

ACCIDENT, is that which does not follow from the nature of a thing, but from some qualities of it. It also signifies qualities as opposed to substances. In Heraldry, it is in coat-armour an additional mark, which may be omitted without effecting any change in the dignity. In Gram., it is something belonging to a word, but not essential to it; as gender, number, inflection.

ACCIDENTAL, ak-se-den'-tal (Lat. accidentalis, hap-

#### Accipenser

pening by chance), in the language of philosophy, is employed to express the effect which proceeds from the cause happening by accident.—Accidental colours are those which depend on the affections of the eye. The term is applied to the ocular spectrum which is generally term is applied to the ocular spectrum which is generally breceived after the eye has been for softe time steadily fixed upon a coloured object. Thus, if we look for some time upon a yellow piece of cloth, and suddenly turn the eye from it, we will see the colour of indigo; red will give a bluish green, and so on. These colours are also called complementary colours, because, when taken in conjunction with those of the spectrum, they make up all the colours of a white light.—Accidental point, in Perspective, that point in the horizontal line where the projections of parallel lines meet the perective plane.

ACTIPENSER, lk-se-pen'-ser (Lat. acipenser, a sturgeon), in lehth., a genus of fishes, of the order of Amphibia nantes. It has a single linear nostril; the month is in the under part of the head, and without teeth; the cirri are below the snout, and before the mouth. There are three species of this genus. I. Accipenser Huso, the largest, is a native of Eussia. The skin is so atom, as to be used for trace in dewing schilds. strong as to be used for traces in drawing vehicles. The isingless of the shops is made from its sounds and Scales.—2. Accipenser Enthenns is also a native of Russia.

—3. Accipenser Sturio, or the sturgeon, is frequent in our rivers. Isinglass is also made of the sounds of this our rivers. Isinglass is also made of the sounds of the length of 18 feet, and weighing 700 lbs. It is oviparous, and spawns in water. (See STURIONIDE.)

ACCIPITEES, dk-sip-e-trees (Lat. accipiter, a hawk), an order of birds, having a crooked beak and powerful the states. In this cades are alsead the vulture falcons.

talons. In this order are classed the vulture, falcons, hawks, and owls.

ACCLAMATION, ill-la-mai'-shun (Lat. ucclamatio), smong the ancient Romans, a shouting in concert, expressive of their public approbation of the conduct of their princes or generals. The acclamations of the theatres, at first rude and tumultuous shouts, became, in process of time, a species of regular concert. When Nero played in the theatre, a signal was given, upon which 5,000 soldiers began to chant his praises, which the spectators were obliged to repeat. the term is applied to those medals on which the people

are represented as expressing their joy.

ACCLIMATIZE, čk-kli-ma-tize (Lat. ad, to, and clima, a climate), to accustom an animal or plant to a climate not natural to it. A change of climate induces a certain change in the constitution of the individual, greater or less, according to the amount of difference between the two climates. In cases where the difference is extreme, diseases and even death may be the result. The change produced by acclimation may be either an improvement or a deterioration. Some plants or animals possess the power of bearing changes of climate to a much greater extent than others; and, frequently, a change which cannot be effected in one individual, may be brought about more gradually in the course of a few generations. The power of bearing changes of climate is remrkable in the human species, parti-cularly in the Anglo-Saxon race. An attention to dis-culating, &c., does much in modifying the influences of climate

ACCOLADE, ak-o'-lade (Lat. ad, to, and collum, the ACCOLADE, ik-o'-lade (Lat. ad, to, and cotum, the neck), a term used to express an ancient mode of conferring knighthood, by the sovereign embracing the neck of the new-made knight. In England, it is generally considered as the slight blow given on the shoulder or cheek when the honour of knighthood is being conferred. Gibbon calls this blow "the emblem of the last affront which it was lawful for him to endure." Some antiquaries derive the origin of this custom from the blow given to the Roman slave by his master when giving him his freedom. giving him his freedom.

ACCOMMODATION BILL, dk-kom'-mo-da'-shun (Lat. ad, to, and commodum, convenience), in Commerce, signifies a bill of exchange accepted by an individual for the convenience of the drawer, with whom it rests to take it up when at maturity.

ACCOMPANIMENT, dis-kimi-pan-s-ment (Fr. accompanyer), in Music, denotes the instruments which, in the subordinate part or parts, accompany the voice, either to give it fulness or relief, and to heighten the general effect. Thus, the plane and the moving body has been constantly accelerated.

#### Accumulation

guitar are suitable instruments for the accompaniment of a song. In concerto, the instrument for which the principal part is composed is accompanied by the whole

principal partis composed is accompanied.

Accompaniment, in Her., denotes anything added to a shield by way of ornament, as the belt, mantling, supporters, &c. Accompaniment is about of or several bearings about a principal one, as a saltier, bend, fess, &c.

Accompanied in Law, signifies an agreement

Accob, dk-kord', in Law, signifies an agreement entered into, whereby one party consents to receive from another something in satisfaction of a debt, or in

row of small elastic springs, or laminæ, fixed in a merow of small elastic springs, or laming, fixed in a metallic plate at one end, in such a manner as to allow them to vibrate freely. A bellows, or folding apparatus, unites the upper and lower parts, and supplies the springs with the necessary air to put them in motion. To these the air is admitted by valves, which, in the same manner as in an organ, are acted on by the keys. A base note, or drone, is also added. The compass of the most perfect instrument is from G, the fourth space on the base cleff, to E, the seventh additional space above the treble, all the semitones inclusive. Previous to the introduction of the principle of this instrument to Europe, it was well known to the The soft tones of the accordion have a Chinese. The soit tones of the accounts have a great effect upon savage nations, as asserted by Roman Catholic missionaries, who carry with them accordions to attract the people to their discourses.—The Figure 1 and the savage of accordion and there is an accordion and there is an accordion and there is an accordion and there is a few accordions are according to the savage and the savage according to the savage and the savage according to the sav TINA is another species of accordion, and there is an ORGAN-ACCORDION recently invented.

ACCOUNT, or ACCOMPT, &k-kount', in general de-notes all arithmetical computations. Among merchants it is used for the books in which their business is entered. (See BOOK-KEEPING.)

ACCOUNTANT, &-bount-tant, a person skilled in mer-cantile accounts. Accountants are usually employed in investigating the accounts of traders, making up states of affairs, collecting accounts, &c. The official in a public office who has charge of the accounts is termed public office who has charge of the accounts is termed an accountant.—Accountant in Bankruptcy is an officer appointed by the logd-chancellor, having the control and management of the funds belonging to bankrupt estates.—Accountant-General, an officer in the court of Chancery, appointed for securing the moneys and effects of the suitors.

ACCOUNTS, CHAMBER OF, in the old French government, was a court similar to the Exchequer of England.

England.

ACCOUNTS STATED, a title given to the common count in the declaration in an action, where, upon a balanced account between the parties, the plaintiff seeks to recover the amount due.

ACCOUTERMENTS, &k-koo'-tre-ments (Fr. accoutre-ment), a term signifying, in military affairs, the dress,

equipage, &c. of a soldier.

ACCERSCENT, äk-res'-sent, in Bot, a term applied to a persistent calyx, that continues to grow after the flowering, so as to form a sort of bladder round the

rout, as in the winter cherry.

ACCEOCHÉ, ak-ro'-shai, in Her., denotes a thing being hooked into another.

ACCUATION, dk-ku-bai'-shun, a term used to express

the posture taken by the ancient Greeks and Romans at their tables. This posture exhibited their bodies extended upon couches, with their heads resting on pillows, or on their clbows, supported by pillows.

ACCUMBANT, ük-kum-bent (Lat. accumbere, to lie

down), in Bot., a term applied to cotyledons which are applied to each other by their faces, and have the radicle folded on their edges, as seen in the embryo of

the wallflower. (See EMBENG).

ACCUMULATION OF DEGREES, &k-ku-mu-lai-shun
(Lat. camulus, a heap), in a university, is the taking of
two or more together, or with small intervals between

#### Accusative Case

ACCUSATIVE CASE, ak-ku'-sa-tiv, in Grammar, the fourth case, governed by an active verb or preposi-tion; as, I love him; where him is the accusative of the pronoun &, and is governed by the verb Love. It more peouliarly belongs to the Latin language, but has been introduced to the English, in which it survives only in pronouns. It comes after all prepositions, and is usually termed the objective case. (See GRAMMAR.)

ACE, aise (Lat. as, a unit), in games, signifies that side of the dice whereon one is marked. In cards, it denotes those which hear only one figure; as, for example, the "ace of hearts," which displays but one

heart.

ACEPHALOUS, ACEPHALA, d-sef-d-lus (Gr. arephalos, headless), in Zool., a class of molluscous animals which have no apparent head.

ACER, ut'ser (Lat.), in Bot., an important genus of thenatural order Aceracea. Many useful and ornamental trees are included in this genus.—Acer sacokarium, the sugar-maple, yields a great portion of the sugar used in America. Perforations are made in the trunk at the commencement of suring and the saccharine as the commencement of spring, and the saccharine sap which exudes is collected and boiled down to the crystallizing point.—A. campestre and A. pseudo-pluta-nus are common timber-trees in Britain: the latter, commonly known as the sycamore, furnishes excellent wood for making charcoal,

ACERACEE, ai-ser-ai'-se-e, in Bot., the Maple order The plants of this order are handsome trees, which furnish light and beautiful wood, much used in the arts. They are also remarkable for their saccharine

arts. They are also remarkable for their saccharine sap. They grow in the temperate regions of Europe, Asis, and North America. (See Acer.)

ACERANS, ACRIA, ā-ser'-rans (Gr. a, without, and keras, a horn), in Ent., a family of apterous insects.

ACERIC ACID, ā-ser'-ick (Lat. acer, the maple), in Chem., an acid obtained from the sap of the maple-

ACEROSE, as'-e-rose, in Bot., a term signifying needle-shaped, applied to leaves that are very narrow and sharply pointed, as those of the common juniper.

ACERIA, a-ser'-ra, a term applied by the ancients to a kind of altar placed near the bed of a dead person. Incense and other perfumes were consumed on it by fire

previous to the funeral, and Acerra were the pots in which the incense was burnt.

ACETABULUM, d-se-tab'-u-lum (Lat. a small cup or dish), signifies, in Zool., the suckers of the arms of the cuttle-fish, as well as other dibrauchiate cephalopods, which have on this account been termed aceta-bulifera.

ACKTABULUM, in Anat., is the term applied to that deep cup-like cavity of the os innominatum which receives the head of the femur, or thigh-bone, thus forming the hip-joint.

ACETABULUM, in Ent., is a term signifying the cavity

in the trunk in which the leg is fitted.

ACETAL, ds'-e-lal, in Chem., a thin colourless fluid, boiling at 221° F., its specific gravity being '821. It is one of the products of the slow oxidation of alcohol vapour under the influence of flucty-divided

ACETABIOUS PLANTS, &-se-fair'-e-us (Lat. acetaria, a

AGETARIOUS LLANTS, a-so-tor-e-ac l.m. acceara, a salad), plants such as endive, mustard-and-cress, lettuce, &c., used for salads.

ACETATE, d'-so-toif, in Chera., a compound formed by the union of a base with acetic acid. Many of the acetates are of great importance in the arts. These will be found under their respective bases.

acetates are soluble in water.

ACETIC ACID, ä-set'-ik, in Chem., is produced by the ACTIO ACID, "eser-ex, in Unema, is produced by the oxidation or destructive distillation of organic bodies containing its elements,—carbon, hydrogen, and oxygen. When pure, it is a colourless liquid of specific gravity 1:064, which crystallizes at a temperature below 60° F. It has a pungent smell, and is highly corrosive. Vinegar and pyroligneous acid are impure varieties of acetic acid. All liquids susceptible of the vinous formentation are capable of yielding vinegar. Of these, the most important is wine, which becomes vinegar by spontaneous acidification. The old method of making the best vinegar consists in partially filling a series of casks placed in a cellar kept at the temperature of 85° F., with a mixture of wine and ready-made vinegar.
The latter, which acts as a ferment, is first put into the

#### Achillea

empty casks, and then a certain proportion of wine. After some days, more wine is introduced, and successive additions are made periodically. When the whole has become vinegar, a quantity equal to that of the wine employed is drawn off, and the process is recommenced. In England, an inferior sort of vinegar is made from an infusion of malt by first exciting in it the alcoholic fermentation, and subsequently inducing the oxidation of the alcohol. The fermented wort is sometimes transformed into vinegar by a process precisely similar to that described above, and sometimes by allowing it to remain for several months in half-filled and loosely-stopped casks, arranged in rows in an onen field. a The German, or quick-vinegar process, After some days, more wine is introduced, and succesan open field. The German, or quick-rinegar process, consists in passing the fermented liquor through a large vessel filled with beechwood shavings moistened with vinegar. In percolating through the apparatus, which is called the generator, the liquor passes over an immense surface expessed to the oxidizing influence of the air, and is rapidly converted into vinegar. The crude acetic acid, known as pyroligneous acid, is one of the liquid products of the destructive distillation of wood. Oak and beech are the woods most commonly used in the manufacture, and the distillation is generally conducted in large iron cylinders. By a beautiful but tedious process, the acetic soid contained in the impure product is made to unite with sode, so as to form pure acetate of sode. This salt, when distilled with concentrated sulphuric acid, yields a colourless liquid, which is acetic acid. A portion of this crystallizes at a temperature of from 40° to 50° F., constituting what is called glacial acetic acid. The chemical composition of acetic acid is represented by the symbol C. H.O... Its uses are numerous and important. In the Arts, it Its uses are numerous and important. In the Arts, it is employed for the preparation of the various acctates, especially those of iron and alumina, which are the chief mordants of the calico-printer, for dissolving gums in making varnishes, and for photographic purposes. In Medicine, it is used externally as a local critical, and internally as a febriluge.—Ref. English Cyclopædio—"Arts and Sciences."

Cyclopadia—"Arts and Sciences."
ACETONE, desc-tone', in Chem., a colourless volatile fluid. having the composition CaHeO2, obtained by the distillation of the acetates of the alkaline earths. It has a peculiar odour, and is very inflammable. It is sometimes called pyroacetic spirit. As a remedy for asthma, it is occasionally used in medicine. In a pure state, it is a colourless mobile fluid which boils at 133° F.

ACHENTUM, a.ks.-me.um, in Bot., a one-seeded fruit, having a dry shell, or pericarp, which is closely applied to the seed, though separable from it. This pericarp is indehiscont, that is to say, it remains closed, and the seed can only become free by its decay. Linneus mistook achemia for seeds, and called the plants producing them gymnosperms (naked-seeded). Several achemia are formed by a single flower. The little hard bodies scattered over the surface of the strawberry, and those we find clustered together in the centre of the butteroup, are schemia. ACHENIUM, d-ke'-ne-um, in Bot., a one-seeded fruit, achænia.

ACHATMA, &-kat-ma, in Zool., a genus of terrestrial

gastropods.

ACHEBONTIA, a-ke-ron'-she-a, a genus of Lepidopte-ACHERONTIA, d-ke-ron'-she-d, a genus of Lepidopterous insects, fam. Sphingida, which embraces some of the largest European Lepidoptera, the most remarkable of which is the Acheronia atropos, or Death's-bead Hawk-moth (which see).

ACHIEVEMENT, d-tsheev'-mest (Fr. achever, to accomplish), in Her., is a term applicable to the shield of symonial hashing conceptly as the hereldic symptomic properties of the shield of symonial hashing conceptly as the hereldic symptomic properties.

of armorial bearings generally, as the heraldic symbols or badges depicted on it were originally the marks of some heroic act or great achievement of the bearer. The term, however, is commonly applied to the funeral achievement of a deceased person, affixed against the dwelling-house, to denote the death, rauk, and station of the late occupant.—Ref. Berry's Encyclopædia Heraldica.

ACHILIRA, a-kil'-le-a, in Bot., a genus of plants belonging to the natural order Composita. The Ackil-lea Millefolium, commonly called the Yarrow, or Mil-foil, is the most important British species. Its white, orrose-coloured flowers, adorn many of our meadows, particularly those with silicious soils, from June to September. From these flowers, which are occasionally

#### Achilles, Tendon

substituted for hops in browing, an essential oil is obtained, and an infusion of the leaves and flowering heads is said to be a valuable stomachic. The pretty garden plant known as white bachelor's buttons is a

garden plant known as white bachelor's buttons is a cuitivated variety of a species of achilles. The generic name is derived from Achilles, who is said to have discovered the medicinal properties of the militoil white studying botany under Chiron.

ACHILLES, TENDON, d-kill-less fort-don (Lat. tendo Achillis), in Anat., a tendon which someous the soleus and guatrocuemius muscles of the calf of the leg with the bone of the heel. It takes its name from the fable of the mother of Achilles dipping kim in the river Styx to render him invulnerable. During this concention she held him by the heel and here be suboperation she held him by the heel, and here he sub-sequently received his death-wound.

ACRILLEUM, & kill-le-um, a genus of fossil Spongia-da, of which there are two species found in the creta-

ceous strate of England.

ceous strate of Engiano.

ACHLAMYNEOUS, & lela-mi'-de-us (Gr. a, without; chiamus, a cloak), in Hot., a term applied to flowers which have only stamens and pistils, the floral envelopes being wanting. The naked flower of the common ash is an example. This consists merely of the essen tial organs of reproduction, and has neither calyx nor corolla

ACHERS, d'Aras, in Bot, a genus of plants, belonging to the order Supetaces, or Supposition family. They are natives of the tropical parts of India, Africa, and America. Several species yield luscions fruits; thus, the Achrus supeta produces the supposition of the superior are manufacturable. The barks of certain species are used medicinally in the barks of certain species are used medicinally in the treatment of fevers, and the milky juices of others yield substances resembling gutta-percha.

ACHROMATIC, dk'-ro-mai-tik (Gr. a, without, and chroma, colour), in Opt., a term applied to lesses which give images free from coloured and indistinct class.

edges. Hall and Dolland discovered the mode of constructing these lenses, by perfectly independent investigations. They both found that the chromatic dispersion which common lenses produced could be done away ses of different kinds of glas with by using two len with by using two lenses of different kinds of glass, joined together. (See Light, Lens, Puiss, Chromatics, Raffaction, Offics.)
ACICILAR, Ankland, or in Bot., a term signifying needle-shaped, applied to narrow leaves, like those of the fir. The term Maser is more commonly used, and

is to be preferred.

ACIDASPIS, de-sid-de'-pie, a genus of fossil Crustacea, of the group Trilobites, found in the Wenlook limestone.

ACIDIFIABLE, A-sid'-e-ft-a-bl, in Chem., is applied to that which is capable of being converted into an acid. Such substances are also termed radicals, and acidifiable bases.

acidifable bases.

ACIDIMETER, Mase-dim'-me-ter, in Chem., an instrument for ascertaining the strength of acids.

ACIDIMETER, Asse-dim'-me-tre, in Chem., an expeditious method of ascertaining the quantity of free acid contained in any given liquid, based upon the law of definite proportions. It is employed as a means of determining the actual or intrinsic value of the crude acids met with in commerce: To facilitate this process, tables have been constructed by Dr. Ure and others. (See VOLUMETRIC ANALYSIS.)

ACIDS, Ma'-sid (Ict. acidss. Sour), a numerous and

and others. (See Volumeric Analysis.)
ACIDS, in'sid (Lat. acidise, sour), a numerous and portant class of chemical bodies, which are distinguished by the property of combining with bases to form salts. (See Basu and Salts.) They are generally sour to the taste; in most instances they have a great affinity for water, and are soluble in it; they regdem nearly all the vegetable blues; they unite with metals or their oxides, alkalies, and earths. It was long held that oxygen was contained in all the soids. This element does indeed enter into the composition of the greatest number; but it has been according that in very many cases the acidifying principle is hydrogen. It has consequently been considered necessary to divide acids into composite, formed by oxygen, and hydracids, formed by hydrogen. These, again, are to divide acids into expectes, formed by expect, and hydracids, formed by hydrogen. These, again, are subdivided into anhydrous acids, ar solds without water, and hydrated acids, or solds containing water. According, however, to the latest researches of chemists, all acids are hydracids. The solds furnished by the

#### Aconitine

mineral kingdom are termed mineral ucids. Wetallic acids are formed by the combination of oxygen and a metal; and organic acids are those which centain carbon, or are formed with organic substances. In the system of chemical nomenclature proposed by the comment French chemists Guyton de Morvau and Lavoisier, the mineral acids are designated by an adjective formed out of the name of their elements, and termination or are not the three subsystems of the subsys Lavoisier, the mineral acids are designated by an adjective formed out of the name of their elements, and terminating in one or is; thus, sulphurous acid, phosphoris acid, implying that the first is formed of sulphur and expen, and the second of phosphorus and expen. If the acid be formed of hydrogen, the term is commenced with hydro; thus, hydrochloric acid signifies that the compound contains hydrogen and chlorials. The two syllables one and is affired to the names of acid compounds, indicate two different modifications; is always denoting an acid which contains more crygen than the acid whose name terminates in one; for example, sulphuric soid has for its acidifying principle more crygen than sulphurous acid. It was at first though that a substance dould not form with crygen more than the two above-mentioned compounds; but cases were subsequently discovered wherein a substance was found to make with oxygen as many as five different combinations. In order to distinguish these combinations from the others, it was found necessary to employ three prefixes borrowed from the Greek; for example, hypo (under), hyper (above), or briefly per (in the highest degree). Thus hyposulphurous acid is an acid composed of sulphur and a smaller proportion of oxygen than sulphurous acid; perchloric acid contains more oxygen than chloric acid, perchloric acid contains more oxygen than chloric acid, end which all contain cashon and hydrogen, a large proportion oxygen, and some nitrogen, have no regular nomenclature. The most important of these chemical portion oxygen, and some nitrogen, have no regular nomenclature. The most important of these chemical portion oxygen, and some nitrogen, have no regular nomenciature. The most important of these chemical bodies are,—among the mineral acids, sulphuric, sulphuricas, hydrosulphuric, nitric, phosphoric, arsenious, areenic, chromic, hydrofluoric, chioric, lodic, carbonic, boracic, and silicio; among the organic acids, formic, hydrocouric, axestic, mailo, tarriaric, succinic, benzoic, citric, &c. (See these words.) Acids are extensively employed in medicine, principally in cases of inflammation, fever, palpitation of the acid, and irritation of the skin.

ACINACIPORE, &-serio-seriors (Lat. acinaces, a scimitar: forms, form), in Bot., a term signifying scimitar:

ACINACIPOUS Assence server of that decimaces, a scinitar; forman, form), in Bot., a term signifying scinitar-shaped; applied to certain succulent leaves.

ACHIVE, de-enes, in Bot., one of the divisions of the fruit of the raspberry.

ACINDES, dk-li'-dees, a missile weapon, supposed to have been a kind of dart or javelin, made use of by the

maye neen a kind of dart or javelin, made use of by the ancient Romans. According to Scaliger, it was a globular weapon, and poised by a wooden stem.

Acard, did-me (Gr. atme, a point), the top or highest point of anything. Physicians use it to express the utmost violence or orisis of a disease; and in Rhet. it denotes the highest point of pathos, to which the mind is conducted by a series of impressions gradually rising in intensity.

According to Avoncey at highests (Gr. alone a

Acology, or Acology, d-hol-o-je (Gr. akos, a remedy, and loges, a discourse), a term signifying the doctrine of remedies, or of the materia medica.

Acology, db'-o-life (Gr. akalouthos, disciple), in the Romish church, one of the inferior orders of the clergy,

whose office it is to attend upon the deacons and sub-deacons in the ministry of the altar, to light and hold nescons in the ministry of the artar, to light and hold the candles, to bear the incense, to present the prinsts with wine and water, &c. In the primitive church, the accives were in lady orders, and ranked next to the accives were in lady orders, and ranked next to the accives are very often performed by laymen and shorister-boys.

Acongre, &k-o-nite (Gr. ekonism), in Bot., the poisonous plant familiarly known as the monkshood, or

wolfshame. (See Acontoun.)

Acourte Acto, ü-kon-i-tik, in Chem., is prepared by the action of heat upon crystallized citric acid, and is found to be identical with that which occurs in the monkshood combined with lime. The salts formed by the union of this acid with different bases are termed account atom

ACONITINE, Or ACONITIA, d-kon'-c-tine, in Chem.,

#### Aconitum

a powerful vegetable alkolid, prepared from the root of the Aconitum Napellus. It is one of the most virulent of poisons, but, at the same time, a very valuable medicine. Externally applied, it produces on the kins a prickling sensation, which is followed by a poedifiar numbress. An outtment containing aconitine is offer used in cases of neuralgia. The alkaled consists of the elements carbon, hydrogen, nitrogen, and oxygen, its formula being Cestla, NO 2.

Aconieum, a-kon-a-time, in Bode, a genus of plants belonging to the matural order Reassendains, the Crowfoot or Buttercup family. Readly all the species are poisonous; but when the antenets prepared from them are used in sproper doses, their narrotic and diaphoretic effects prove highly beneficial. The flowers of many species are remarkable for their heauty, and resemble little belimets. The root of the Aconitum Perox is the principal source of the celebrated Indian poison Bish, or Bish. The monthhood, Aconitum Rapellus, is a native of Europe, and occurs in several parts poison Bibb. or Bisb. The monkshood, Acception Repellus, is a native of Europe, and occurs in several parts of this country, particularly in Herefordakire, Devokshire, and Somersetchire, and is ordivated as a garden leant for the sake of its handsome purple flowers. This species is the officinal plant of our Pharmacopous, and the preparations from the area of neuralgia, acute rheumatism, and diseases of the heart. Its active principle according (see Accomptant). The root of the A. Astrophylium is said to possess mo poisonous properties, and to have a high reputation in India as a febrifuge and antiperiodic medicine.

Acontal, &-kon-she-a (Gr. Akon, a dart), a genus of

India as a febringe and antiperiodic medicine.

ACONIA, A-kori-she-a Gr. Akon, a dart), a genus of serpents established by Ouvier, and forming a link between the true serpents and the common anakes.

Charac. Without bones; the usual lizard or serpent head; body covered with small scales only, but without the horny plates which guard its under surface in the common serpents; without poison-langs, and with cartle holite, in general of a small size and if facility. gentle habits; in general, of a small size, and it feeds on worms and insects. It is found in almost every part

of the old world.

Acons, at kern (Sax. acc, an oak, and cern, grain), in Bot., the fruit of the oak-tree. Acoras form excellent food for swine, and are said to have been used by man for food in the golden age. (See

form excellent food for swine, and are said to have been used by man for food in the golden age. (See QUERCUS.)

Aconn, in Maritime affairs, a small piece of wood placed on the top of the spindle of the matheads of ships, to keep the vane from flying off.

Aconns, ai-ka-rus (Gr. a, without, and kore, pupil of the eye), in Bot,, the sweet flag, a member of the natural order Oroniacea. This plant grows in watery places, and abounds in the rivers of Norfolk, whence the London market was formerly supplied. It blossoms during the months of May and June, and is the only truly aromatic plant growing wild in this country. The thick creeping stem or rhigome, commonly called the root, is the valuable part of the plant, it is somewhat apongy and powerfully aromatic, and has a bitterish taste. It is used by the rectifiers to improve the flavour of gia, and is also employed to give a peculiar taste and fragrance to certain kinds of beer. Perfumers make use of it in the imanufacture of hair-powder, and tanners in the preparation of peculiar sorts of leather. From the fresh chisome a volatile oil is obtained by distillation, used is making aromatic vinegar, and for secting smill. In Med., the sweet flag is cometimes used as an aromatic stimulant and a mild tonic, and many physicians speak highly of its beneficial effects in cases of after. If grows in most parts of Europe, in Asia, and in the United States; and in Othello sountries it is used for strewing the churches at great factives.

#### Acoustics

horsetalls, pepperworts, club-mosses, mosses, liverworts, aharas, inchens, fungi, and alge.

Accessus, akso-ake, is a small rodent animal very much resembling sha agenti, but less in size. It is an inhabitant of the woods of Guians, his only the rudiments of a tail, and adhesiat signs almost, and, and inhabitant of the woods of Guians, his only the rudiments of a tail, and adhesiat signs almost, and, and other forms of Agestalls food. (See Account.)

Accounts Bures, a hor sizes (Gr. akens, I hear), is that branch of Etypine which there is not the laws which regulate the produced by saming the size or external passage of the war.

Accounting, a hor sizes (Gr. akens, I hear), is that branch of Etypine which there is also adence of sound. Sound is produced by saming the size or any other sizes in the sizes of the laws which are perceived by the organ of hearing. In giver words it is the adence of sound. Sound is produced by saming the size or any other classic body, to assume a ribratory motion. No pody can produce a sound, saless its parts be put in residuation. The string of a nusical metimizent, a tuning-forth, or the parehment head of a dram, are not sonorous unless their particles be caused to assume a state of vibration. It is likewise necessary that there should be an elastic substance, whether solid or fluid, between it and the ear, or the sound will not be appreciable. For instance, a bell rung under the exhausted receiver of an air-pump will yield coarcely any sound. Although air, from its being the medium most commonly in contact with the negative was heard across the whole extent of the water, a disfance of nine miles. With respect to its production in the air, Sir John Herschel has shown that, in round numbers, sounds of every intensity travel, at the temperature of 62° Fahr., at the rate of 1,135 feet per second, equal to 124 miles per minute, or 765 miles as hour. The velocity with which sound travels through different bodies with temperature. M. Wertheim made an elaborate varies greatly. The velocity of sound in air differs with temperature. M. Wertheim made su elaborate series of experiments upon this subject, and some of his results give the following:—

Tempere	sture of A	ir.	Velocit	y of Sound.
0.20	centigra	ie	1,0	89 feet.

The intensity of sound is much augmented if the vibrations be confined in tubes and causies of any kind. By means of a speaking-pipe, stoineds, bowers slight, may be transmitted from one part of a building to snother; whilst the stellocarde conveys to the such the sight but ominous sounds that are generated in the chest. Blot ascertained, that her singlifest sound can be heard through as you give 3, 120 feet in founds can be heard through as you give 3, 120 feet in founds from the search the sounds of the sounds are stored to comment the mountainesses to consider a search decomposition of the city of leading the sounds are different to the cit result. Sounds are different only in intensity of leadings, as the reports of a much as any of a form the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; while others, again, are different in the same instrument; the same note sounded upon a trumpet and none a furle. We have seen that sound is reduced by a occusion vibratory force being transmitted through sir, preducing what is termed a wave of sound. The same is designed to take cognizative of these pulses of force, waves, or tremors, within occusion limits. The nature of things prevents a single wave of sound from ser coming slone; the more nearly alone a wave comes, the more sharp and audden the sound is called a pulse, in the substitution laws of the same and treble clof, is produced by waves should a the sound is called a noise. When the waves of one note becars a simple ratio (1, 1, 2, 1, 1, 1, 2, 1, 3, 4, 3, or 4) to the di between a grave sind an faute sound; but it is only from attentive observation by the sys that we discover the different registity of succession is the vibrations which produce them. The vibrations of a great many though a setting, bells, and membranes, when emiting sounds, may however be distinctly seen, and even felt; but they may often be rendered more visible to the eye by a fittle artifice, such as sprinkling the vibrating body with sand, or some light granular substance. It was reserved for the celebrated Chiedni to the middle of one of the sides, upon which the sand is vibrating body with sand, or some light granular substance. It was reserved for the celebrated Chiedni to the middle of one of the sides, upon which the sand is vibrating body with sand, or some light granular substance. It was reserved for the celebrated Chiedni to the middle of one of the sides, upon which the sand is vibrations visible, and his discovery—— as an admirer of music, the elements of which I had begin to learn rather late, that is in my mineteenth year, I noticed that the science of Acoustics was more neglected than most ofther portions of physics. This excited in me to the desire to make good the defeat, and by new discovery to render some service to this part of science. In the stand is a plate of glass or metal gave discovery of an air-pump; be then exhausted it of its atmosphere sid. The bell was agitated, but gave out was according the propagated by the following experiment. The professor placed a bell in the glass vessed, not the faintest tinkle could be alsting of bells, to which one or two violis bows were fairly but though a spectator placed by applied. This suggested to me the idea of employing a violin bow to examine the vibrations of employing the violation of the six of the substance of the plate of glass fixed to me the idea of employing the corresponding modes of vibration. As this time a professor placed in the science of the six of the professor placed in the section of the six of the professor placed in the

squares of 2, 3, 4, 5, &c.; but the nature of the me-tions to which these sounds corresponded, and the means of preducing each of them at will, were yet unknown to the. The experiments on the electric figures fermed on a plate of rosin, discovered by Lich-teriors, impairment that the different vibratory motions of a suncerous plate might also present dif-ferent appearances if a little sand, or some similar substance, mans arread on the surface. On employing this means, the first figure which presented itself to my eyes, upon the shrutar place already mentioned, resembled a star with the new twelve rays, and the very soute spind in this series alleded to was that which agreed with the square of the number of diame-trical lines. These spects may be clearly shown by squares of place glass. These plates may be held by a

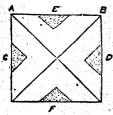

small wooden vice, or secured by a clamp in the centre, as shown in the accompanying figs. The edges of the plate must be smoothed by emery, and sand strewed upon

Acoustics.

the bell was heard. Mr. Charles Brooke, in the sixth dedition of his excellent "Manual of Natural Philosophy," states, "From a series of highly-interesting experiments on this subject by Faraday, it appears evident that while the accumulation of sand, or any other coarse and heavy powder, on the nodal lines arises from its being as it were jerked off from the vibrating pertiens, the vibrations excite currents of air over the agitated portions, which entangle any light one, as lycopodium, it will be caught up by the aerial currents, and will collect disciply on the most agitated portions of the plate, instead of on the quiescent portions, and appear animated with a curious rortex-like motion. If the plate be vibrated in highly-rarefled air, the tycopodium will be collected on the nodal lines, like the sand when vibrated in ordinary states of atmospheric pressure; and if the plate be covered with sand, and made to tibrate in a much denser medium, as water, the sand will be under the same conditions as water, the sand will be under the same conditions relatively to the medium as the lycopodium in air, and will be collected chiefly on the most agitated portions of the plate. Thus the

lines A, B, in the accompanying figure, represent the position of the sand when the plate is vibrated in sir, and of the lycopodium when in vacuo;
o and the triangles C, D,
E, F, the parts or internodal spaces where the sand is collected when the plate is vibrated in water. The vibrations of a membrane may be well exhibited by stretching a

piece of bladder over the mouth of a funnel and passing a horse-hair, retained by a knot, through its centre. By drawing the hair through the fingers, centre. By drawing the hair through the flugers, previously rubbed over with rosin, the membrane will be made to vibrate; and if sand or lycopodium be scattered on its surface, a symmetrical arrangement of the heavy particles at the nodal lines, as well as the accumulation of the light particles at the centres of vibration, may be observed. If a thin membrane be stretched on a friangular, square, or circular wooden frame, and strewed with sand, its vibrations will be readily excited by holding a tuningfork, bell, or other vibrating body, near it, and they fork, bell, or other vibrating body, near it, and they will be indicated by the motions of the particles of will be indicated by the motions of the particles of sand. From tracing-paper, or still better, thin parchment-paper (prepared by immersion in strong sulphuric acid), damped a little and attached by paste to the edges of the frame, will answer very well for these experiments."—Ref. Brooke's Natural Philosophy, 6th ed., Sir John Herschel's art on "Sound" in the Encyclopadia Metropolitans; Lectures on Sound, by John Tyndall; English Cyclopadia.

AUQUITAL, Lewit til (Fr. acquitter, to free or discharge), in Law, signifies a deliverance from a criminal charge. Thus, one who has been upon his trial for the commission of a crime, and is selivered from the charge by the verdict "not guilty" of a jary, is said to be acquitted. Should a person be indicted a second time on the same offence, he may

jury, is said to be acquitted. Should a person be in-dioted a second time on the same offence, he may always answer the charge by pleading this verdict, termed the plea of "autrefois acquit," by which he will be entitled to be set at liberty. Acquittance, it-keet'-times, in Law, a written dis-charge for a sum of money that has been paid. An acquittance in full of all demands will discharge all daths areast such a are on acquility wis secretal

debts, except such as are on specialty; viz., secured by bonds and instruments under seal. These latter

by some and instruments under seal. These latter can only be discharged by a deed.

ACER, al'-ker (Lat. ager, Gr. agree, a field), a measure of land, which, in the United Kingdom, has several values; but when used in a general sense, the English statute acre is to be understood. Its dimensions may be readiest accertained by remembering that a square with its eide of 22 yards is the tenth part of an acre. The chain with which land is measured is 22 yards long, and 10 square chains are equal to one acre, or 4,840 square yards. There are 640 acres in a square mile : thusAcrolein

Anra Roods. Perches. Square Yards. 180 4,840 1 40 1,210 301

The Irish acre is larger than the English, 100 of the former being nearly equal to 162 of the latter. The Scotch acre is also larger than the English, 48 of the former being equal to 61 of the latter. In various parts of the country there are, besides those we have mentioned, local sures; such as the Cheshire acre of 6 yards to the pole.

yards to the pole.

Achidians, Acedra, S. kriz'.-- due (Gr. skrie, a locuet), a family of orthopterous insects.

Acetris, Acetra, dekr'-tes (Gr. skrites, indiscergible), the simplest and lowest division of the saimal kingdom, which embraces the Injuscria, Rhicopolia,

ible), the suppease and the laylucoria, Rhizopella, kingdom, which embraces the laylucoria, Rhizopella, and Sponges. (See these words.)

Achorat, lik'-ro-bid (Gr. akron, an extremity, and baino, I go), a name given by the ancients to rope-dancers, vaniters, &c. Acrobats perform both upon the tight and slack rope, or upon ropes placed horizontally, perpendicularly, or obliquely, and the exercise of their craft requires great strength, agility, and foarlessness. Acrobats are frequently mentioned by the writers of ancient Roms and Greece; and many, in the present day, have, by the extraordinary nature of their performances, acquired considerable popularity. For instance, Madame Saqui, Herr Hengler, and M. Blondin, who crossed the Falls of Niagara, carrying a man upon his back, upon a single rope, stretched and fastened to the opposite shore.

Acrochordus, ük-ro-kor'-dus, a genus of serpents

ACROCHORDUS, \(\vec{u}k\)-ro-kor'-dus, a genus of serpents discovered in Java. Charac. Head flat, and with the body covered with small scales; without poisonfangs, but possessing a double row of sharp-pointed teeth; throat capable of great extension; tongue thick and short; length from 8 to 10 feet.—It has been in-ferred that this serpent is frugivorous, a point doubted by Cuvier. A specimen of this reptile, procured by Homestadt, measured eight feet three inches in length, and three inches in diameter, while the greatest breadth of the tail did not exceed half an inch. It was captured in a pepper-tree plantation by some Chinese, who, says Homestadt, cooked and ate the flesh. It was a lemale, and when cut open was found to contain fine perfectly formed serpents, each about nine inches long. In the asomach was a quantity of half-digested fruit.

digested fruit. According to the control of the con

Acotyledons (Jussieu), so named from the fact of the sesence of cotyledons amongst this class of plants. Exembryonate (Richard), designating the absence of any regular embryo in the reproductive cells or

sporces.

Cellulares (De Candolle), denoting the general absence of vascular tissue and the prevalence of cellular tissue in these plants.

Agama, of various authors, implying the absence of the necessity of the union of two cells in order to re-produce a new individual.

produce a new individual.

Cryptogamic (Linnaus), intended to convey the idea
that if two cells were necessary to the reproduction
of the new plant in this class, it was not obvious, as
in the Phesogamous plants.

The Acrogens, as equivalent to the shore expressions for the same class, embrace all those plants which
are included in the above definitions. This term is
itself, however, not only applicable literally to those
plants which, destitute of flowers, possess a stem growing in a manner distinctive from those called Exogens
and Endocens. It has been thus restricted by Lindley and Endogens. It has been thus restricted by Lindley in his "Vegetable Kingdom," and he places the stem-less floweriess plants in another class, called Thallorens.—Ref. English Cyclopedia; Butler's Manual of Botomy.

ACROLUIN, dk'-ro-less (Lat. meer, sour; oleum, oil), in Chem., a highly volatile liquid, produced by the

#### Acrolitha

action of heat on fat. Its vapour attacks the eye and the nucous membrane of the nose most distressingly. the museus memorate of the elements carbon, hydrogen, and oxygen, in the proportions expressed by the formula C. H. O. . It was first isolated and examined by M.

C. H. O.. It was tirst isolated and examined by M. Bedtenbacher, of Prague, in 1848.

ACROLITES, Mc-ro-liths (Gr. akron, extremity, and lithos, stone), in ancient Greek Sculpture, signified those attues the heads, arms, and feet of which were of stone, the trunk of the figure being of wood. Acceptable of Machine Western Combability Mellin Colombia cording to Trebellius Pollio, Calpurnia caused an acrolithan statue of Venus to be executed. There was also an acrolithan statue of Mars in the temple of that god at Halicarnassus.

that god at Halicarnssus.

ACRONYCHAL, ük-ron'-e-kal (Gr. akron, the highest poins, and nuklos, of 'night), in Astron., applied to a star when it is opposite to the sun, or passes the meridian at midnight. A star is said to rise acronychally when it rises at sunset, and to set acronychally when it sets as the sun rises. Opposed

ACROSALENIA, à-kros-à-le'-ne-à, a genus of fossil Echinadermata, occurring in the Isle of Sheppey. ACROSPIEE, àk-ros-pire' (Gr. akros, summit, speira, a spiral), in Bot., the sprout at the end of a seed which has commenced to germinate,—the plumule of modern botanists. Maltsters use this term to express the growing of the barley.

ACROSTIC, a Pros'-tik (Gr. akros, beginning, and stichos, a verse), a poetical composition, disposed in such a manner that the initial letters of each line, taken in order, form a person's name or other complete word or words. By some authorities it is held to have been invented by Pornhyring Outstand plete word or words. By some authorities it is held to have been invented by Porphyrius Optatianus in the 4th century. This kind of poetical trilling was very popular with the French poets from the time of Francis I. until Louis XIV. Among other English writers, Sir John Davies, who lived in the 16th century, amused himself in this way. He produced twenty-six pieces, called "Hymns to Astrea," each of them forming an acrostic upon the words Elizabetha Regina. The following is an example: The following is an example :-

> E ternal virgin, goddess true, L et me presume to sing to you.
> I ove, e'en great Jove, hath leisure
> 8 ometimes to hear the vulgar crew
> A nd hears them oft with pleasure.

B lessed Astrea! I in part E njoy the ble-sings you impart, T be peace, the mijk and honey, H umanity, and civil art, A richer dow'r thau money.

R ight glad am I that now I live High glad am I that how I live, E en in these days whereto you give G reat happiness and glory o I fafter you I should be born, N o doubt I should my birthday scorn, A dmiring your sweet story !

In the Old Testament there are twelve Psalms written In the Ole, restament there are tweive resums written according to this principle. Of these, the 119th Psaim is the most remarkable: it consists of twenty-two stanzas, each of which commences with a Hebrew latter, and is called by its name.—Ref. Hock's Charch Dictionary.

ACBOSTICHUM, d-kros'-te-kum, in Bot., a genus of ferns, of the Polypody sub-order. The species Huacsoro is used medicinally in Peru, and is much esteemed

for its audorific, diuretic, and febrifugal properties.

Acrotemnus, a-kro-tem'-nus, a genus of fossil
Ganoid fishes. One species is found in the chalk of Sussex.

ACECTERIA, d.kro.te'-re-a (Gr. akroterion, the ex-tremity of anything), in Arch., a term signifying the pedestals placed upon the sides and centre of pedi-ments for the reception of statues. The term is some needs of the reception of statues. The term is sometimes applied to the small intervening spaces between the pedestal and the balusters of salustrades.

Acr, dkt (Lat. ago, I act), in Pol., a term signifying any public act, such as an act of parliament, an act of great five the property of statement, and the first five for the property of statement, and the first five for the property of statement and the first five for the statement and the statement an

ang any puone act, such as an act of parliament, an act of grace for the pardon of offenders, &c.—dct, in Logic, denotes an operation of the human mind, as an act of the judgment, an act of the will.—dct, among lawyers, denotes an instrument or deed in writing, the human skin, puts out the fire, and performs the serving to prove the truth of some bargain or transpaction.—dct, in the universities, is a thesis maintained abstracting oxygen from the bodies which it affects in public by a candidate for a degree. At Oxford, the Fire is extinguished by sunlight through the diminus-

#### Actinism

time when masters and doctors complete their degrees is called the Act, which is held with great solemnity. Act, in Dram. Lit., the division or part of a play. With the arcient writers, it was held that a play should be divided into five parts or acts, neither more nor less. Following this rule, tragedies, from the Elizabethan period downward, have been divided into five parts; but at the present time this rule is considered, especially in the case of the lighter forms of dramatic literature, purely arbitrary, and some excellent dramas have had no more than three acts. As in the Greek drama the stage was never left empty from lent dramas have had no more than three acts. As in the Greek daams the stage was never left empty from the beginning to the end of a performance, there were no acts. The chorus, during the absence of other actors, kept the stage, and continued the drama by their songs, which mostly formed an essential part of it, and carried on the action in the same way as the dislogue did. In the "Samson Agonistes" of Milton may be seen the exact copy of a Greek drama, where the performance is carried on from beginning to end, without any division of acts. Among the Romans, however, theatrical representations were differently conducted. On their stage there was no chorus, and however, theatrical representations were differently conducted. On their stage there was no chorus, and the play was broken into perts, as in our own. The first products of the English dramatic genius were what were called "Mysteries" and "Moralities," which were not divided into acts. The earliest of the moralities which take the dramatic shape are dated from the commencement of the reign of Elizabeth. Down to 1574, it is believed that the scene of a "morality" never changed from the beginning to the end of the performance. performance.

ACT OF FATH (auto da fé), in Catholic countries, is a solemn day held by the Inquisition for the punishment of heretics, and the absolution of accused persons found innocent. It was always celebrated on a Sunday

found innocent. It was always celebrated on a Sunday or a boliday of the Church. (See Stitum) Act of Parliament. (See Stitum) Act of Parliament. (See Stitum) Act of Tolkration. (See Tolkration, Act of.) Act of Tolkration. (See Uniformity, Act of.) Act of Uniformity. (See Uniformity) Act of.) Act of.) Act of Uniformity. (See Uniformity) Act of.) Act of.) Act of Uniformity. and the people, and therefore formed a species of Roman newspaper. The Acta continued to be published until the reign of the emperor Julian.

ACTER, at-tec-e, in Bot, a tribe of plants belonging to the Buttercup order, or Ranunculacca. They have elegant flowers and succulent fruits. The most important species is the Podophyllum peliatum, the May-apple or wild lemon of North America, which is employed in medicine. The extract has a much more powerful cathartic effect than extract of jalap. The active principle has lately been isolated, and is termed Podophyllin.

ACTINIA, at-tim's-2 (Gr. aktis, 2 ray), in Zool, 2

ACTIVIL, ak-tin'-i-ë (Gr. aktis, a ray), in Zool, a genus of Polypes. (See CGLENTERATA.) There are many British apecies, which are commonly known as sea anemones, from their resemblance to flowers. They are found on all rocky coasts, and they form the chief attraction of the marine aquarium. The body is conical attraction of the manne aquarium. The body is coincial or cylindrical, adhering to the rock by a broad disk-like base. The mouth, which is a simple opening into the internal cavity serving as a stomach, is surrounded by numerous tentacles, which are often beautifully marked. These organs are retractile, and, when not covered by water, the actinic appears as a smooth horsical-based laws is cluster sometimes of a bemispherical lump of elastic matter, sometimes of a brilliant colour. The reproductive power of these plant-like animals is very great, for when one is out across, new tentacles form in a few weeks on the lower

half, and each piece becomes a perfect creature.

ACTINISM, &k-tin-icm, the chemical principle of light.

Three distinct principles emanate from the sun,—light, beat, and actinism. Numerous examples of the effects

tion of the amount of oxygen necessary for combustion; and photographic operations are mostly effected by the reduction of oxide of silver to the metallic state, by the abstraction of its oxygen. We may have actinism without light, or vice vered. Yellow glass transmits the latter, but stops the former. Hence the photographer works in a yellow light. Dark blue glass, which transmits but little light, is quite pervious to actinism. Blue objects reflect great quantities of it, while red or yellow once reflect but little, or none. For this reason, in photographs, red or yellow materials are always too dark, while blue ones are too light. The electric and lime lights give out great quantities of actinism, from their blue tinge; and gas and candles but very little, from their yellow colour. The amount of actinism received from the sun differs considerably, seconding to the time of year, being at its maximum tion of the amount of oxygen necessary for combustion; according to the time of year, being at its maximum about the end of March, and gradually diminishing until the end of December, when it arrives at its minimum. Actinism in large quantities is necessary to the proper condition of the human system. It has been noticed that when dark rooms have been coloured with noticed that when dark rooms have been coloured with yellow paint or paper, the inhabitants of them have been nickly and delicate; as soon, however, as the colour was changed to blue, a marked difference in their state, of health took place. The germination of seedis greatly retarded by actinism; bence the maltster puts his grain into the dark, to malt or semi-germinate. For the same reason, seed is buried in the ground. As soon, however, as the young plant makes its appearance, a supply of actinism is necessary, and, by a wonderful provision of nature, this influence is at its height when young plants are beginning to show their heads above the earth. White, red, brown, and green sea-plants owe their colour to the different amounts of actinism they receive: the green, being near the sea-plants owe their colour to the different amounts of actinism they receive: the green, being near the surface, receive most; while the white, being at great depths, receive nearly none,

ACTINOCRINITES, dk-tin-c-krin-V-tees, a genus of Crinoidea, comprehending a great many species. It is found in carboniferous and Silurian strats.

ACTINOLITE, dk-tin'-o-lite, a crystallized mineral, found in masses in primary stratified rocks, and, occasionally, in trap rocks. It is of a green colour, and is a variety of horablenda

is a variety of hornblende.

ACTINOMETER, ik-tin-om'-e-ter, an instrument in-vented by Sir John Herschel, to accertain the intensity of the heat of the direct rays of the sun. It consists of a thermometer, with a large bulb filled with a dark blue fluid. This is enclosed in a box, the sides of which

of a thermometer, with a large built filled with a dark blue fluid. This is enclosed in a box, the sides of which are blackened, and the whole covered with a thick plate of glass.—Ref. Sir John, Herschel's Manual of Scientific Inquiry, and Breoke's Natural Philosophy.

ACTION, ak'-shun (Lat. ago, I act), a term used in Mech. and Phys. to imply the pressure or percussion of bodies against each other. Action and reaction are equal; i. e., the resistance of the body put in motion is equal to the force communicated to it.

ACTION, in Oratory, is the outward deportment of the speaker, or the accommodation of his countenance, voice, and gestures, to the subject of which he is treating. In Physiol, it is applied to the functions of the human body, whether vital, saimal, or natural; in Paint, and Sculp, the attitude or position of the several parts of the body, as indicative of passion, &c.; in the Mil. Art, an engagement between opposing forces: Action of the mouth" is a term applied to the function; to the several parts of the body, as indicative of passion, &c.; in the Mil. Art, an engagement between opposing forces: Action of the mouth" is a term applied to the champing of the bit of a bridle by a horse.

ACTION AT LAW, is a right of prosecuting to judgment, in a court of law, a claim for a sebt, for demanges, for sai injury sustained, or a wrong done, or to obtain possession of what, the right owner is deprived of.

Real, or, as they were formerly called, feudal actions, concerned real property only, whereby the plaintiff (salled the demandant) claimed the specific recovery of a debt or personal chattel, or satisfaction for some injury sustained, or a wrong done to this person or property. Mixed actions are those whereby a person either claims the specific recovery of a debt or personal chattel, or satisfaction for some injury sustained, or a wrong done to the other two, wherein some real property is demanded, and also personal damages for a wrong sustained. The Act of 8 & 4 in the contract of the supersonal damag

#### Acupuncture

Will. IV. c. 27, abolished real and mixed actions, except the following:—the writ of right of dower, dower, quare impedit, and ejectment, which subjects will be treated of under their respective titles. Personal actions are founded ex contracts (or on contracts), or ex delicte, or of torte or wrongs. The latter are often considered as of three kinds; viz., a nonfeasance, or the omission of some act which a man is bound to do; misfeasance, being the improper performance of some act which he may lawfully do; or malfeasurce, being the commission of some act which is unlawful. The forms of personal actions in use are the following :form of personal actions in use are the following :—
debt, covenant, detinue, trespass, trespass on the case,
and replevin; for which refer to these different titles.
They are also divided into local and transitory actions.
In the former, the trial must (except as aftergards
mentioned) take place in the county, or county of a
city or town, wherein the cause of action arose; in the
latter it may be had in any county, or county of a city
or town. A judge has the power to direct the trial to
be had in any particular place. (See Sur.)

ACTUR, &&-sig, denotes something which communicates action or motion to another, in opposition to

ACTIVE, & denotes something which communicates action or motion to another, in opposition to
passive, which receives action. Active verbs in grammar not only signify doing or acting, but are followed by nouns, to which their action passes.

ACTIVE MOLECULES. (See MOLECULES.)

ACTOR, & deleter or one who performs a part or character in a play. Among the ancient Greeks, actors were
so highly esteemed, as sometimes to be sent on embassies, and authors frequently performed in their own
plays; but at Rome, if a person became an actor, he
forfeited his right of voting as a Roman citizen. In
England, actors were at first the servants of the higher England, actors were at first the servants of the higher nobility; and, when regular theatrical companies came to be formed, they placed themselves under the pro-tection of some distinguished person. To this day, the players at the Drury-lane Theatre continue to style themselves "her Majesty's servants." Until after the

prayers at the Drury-lane Theatre continue to stylo themselves" her Majesty's servants." Until after the Restoration, the female parts in each drama were performed by men. The last celebrated performer of women's parts was Kynaston. Two great authors were also actors; viz., Shakspere and Molière.

ACTS OF THE APOSTLES, akts, the fifth in order of the books of the New Testament, and the last of those properly of an historical character. It gives a narrative of events that happened to the early church during the thirty years immediately succeeding the narrative of events that happened to the early church during the thirty years immediately succeeding the death of Christ. It does not, however, narrate the "acts of the spostles" generally, being almost exclu-sively confined to those of Peter and Paul. The author of this book was Luke, and its authenticity is

#### Acute

Acure, &-kute' (Lat. acutus, sharp), the opposite of obtuse, is a term applied to various things to denote counse, is a term applied to various things to denote sharpness. Acute angle, in Geometry, signifies an angle which is less than a right angle. Acute diseases, in Medicine, are those which are attended by violent symptoms. In Music, a tone is Acute when it is sharp or high, in respect to another tone, and as opposed to the grave. In Grammar, an acute accent is that which elected the roles. elevates the voice.

elevates the voice.

ADACTED, d-ddk'-ted, in Mil., a term signifying the stakes or piles driven into the earth by large malls shod with iron, to secure ramparts or pontoons.

ADAGIO, a-dai'-je-o (It. adagio, leisurely), in Music, a term signifying the slowest of all time, the grave only excepted. Sometimes it is repeated, thus—adagio, adagie, —to denote a still slower time.

ADAMANT, ād'-d-mant (Gr. a, not, damao, I break),

a supposed impenetrable stone; a term applied to the diamond and other bodies of extreme hardness, (See

DIAMOND.)

ADAMITES, ad-am-ites, in Eccl. Hist., a sect which arose in the 2nd century of the Christian era, and were arose in the 2nd century of the Christian era, and were so called from their pretending to the innocence of Adam at the time of his creation. They imitated his nakedness in their churches, which they called Paradise, and rejected marriage; living, or pretending to live, in continency. This sect did not last long; but it was revived, with additional absurdities, in the 12th century, by one Tandamus. About the beginning of the 15th century, these absurdities were again revived by one Picard, a native of Flanders. He propagated his views in Bohemia, whence they spread into Germany, Holland, Poland, and even into England.

Adansonia digitata, the bacbabtree, is the typical species. This is remarkable for its enormous size, and belonging to the tribe Bombacea, of the Silk-cotton order, or Sterculiacea. Adansonia digitata, the bacbabtree, is the typical species. This is remarkable for its enormous size, and for its extraordinary longevity. One specimen has been found to have a trunk nearly 100 feet in circum-One specimen has ference; and the age of this gigantic vegetable is pro-bably many thousand years. The leaf of the baobab is digitate, branched into finger-like leaflets; hence its specific name. The fruit commonly known as monkey-bread, or Ethiopian sour-gourd, is a large oval capsule, containing a starchy pulp, having a slightly acid flavour, which forms a wholesome and agreeable article of food. Mixed with water, it makes an acid drink, of food. Mixed with water, it makes an actual which is highly esteemed as a specifio in putrid and pestilential fevers, and is also employed by the Egyptian doctors in dysentery. The leaves have astringent properties; and, when dried and powdered, they form the condiment called *lalo*, which the Africans mix with their Arie food as a proposition of accessive numerical their daily food as a preventive of excessive perspira-tion. The bark is said to be febrifugal, and its fibres are used by the African tribes living in the districts where the Boabab flourishes for the manufacture of cordage and various articles of dress. Adanson first described this remarkable plant.

Anaris, a'-dap-is, in Zool., the name of a genus of fossil pachydermatous (thick-skinned) manmals, first described by M. Cuvier, who deduced its existence and anatomical conformation from three fragments of the head, which had been discovered in the gypsum-quar-

ries of Montmartre.

ADAPTER, &-dap-ter, in Chemical Manipulation, a tube, generally of glass, rather wide at one end and small at the other, used for connecting a retort or any other distilling apparatus with a receiver. The wider end admits the neck of the first vessel, and the tupering part enters the other.

ADAR, a'-dar, the twelfth month of the ecclesiastical and the sixth of the civil year of the Jews. It comprehends a portion of February and the beginning of March.

ADDA, ad'-da, the Arabic name for a small species of lizard found in Arabia, Egypt, and Nubia, wherever the smallest degree of moisture exists.

smallest degree of moisture exists.

Ander, the common viper. (See Viper.)

Anders-rongur, in Bot., the familiar name for

a tribe of ferns. (See Openoglosser.)

Addiction, ad-distrit, a term among the Romans,
applied to persons who, being unable to pay their
debts, became the slaves of their creditors.

#### Addresses

ADDICTION, id-dik'-shun, in the Roman Law, was the signment to another of goods, which goods were called bona addicta.

ADDITION, id-disk'-un, in Music, is the term applied

ADDITION, ad-aiss-tes, in music, is the term applied to a dot placed on the right side of a note, to signify that it is to be sounded half as long again.

ADDITION (Ext. addo, I give to), in Arith., signifies the putting two or more quantities together so as to form one total. It is the first of the four fundamental rules of Arith., the operation of which consists in adding together first the units, then the tens, then the hundreds, and so on; thus substituting for the original operation of adding the entire number, several simpler and easier operations. When the quantities to be added consist of several denominations which divide themselves into each other, as in the case of shillings, pence, and farthings, hundredweights, pounds, and ounces, or yards, feet, and inches, the smaller denominations are first added together, and, should their product equal or exceed the quantity of a superior denomination, it is carried to the next column of figures denoting that superior denomination. In addition of fractions, the various fractions must be first reduced to the same denominator, in order that they may represent quantities of equal value; then add together all the numerators of the fractions so reduced, together all the numerators of the tracuous so reduced, and give to their product the common denominator. In addition of algebraical quantities, they should all be written one after another, without changing any of the signs, and the terms which before had no sign, should be connected with the rest by the sign + . Thus a + signs, and the terms which becomes the sign +. Thus a+b and a-2b added, give a+b+a-2b; or the sum may be reduced to a simpler form by observing that b subtracted twice and added once, is equivalent to bsubtracted twice and added once, is equivalent to be subtracted once, and that a is added to a; the expression then becomes 2a - b.

Additions, in Law, are those designations affixed to

a person's name by way of title.—Additions of degree, are the same with titles of honour.—Additions of are the same with three of honour. — Additions of estate, such as yeomen, gentlemen, &c.—Additions of mystery or trade, are baker, mason, &c.—Additions of place or residence, are of London, Bristol, &c.

ADDESED, &d-dorsd' (Lat. ad, to, and dorsum, the back), in Her., a term used when any two animals or other things are placed back to back.

ADDRESSES OF PRESONS OF RANK OR DISTINC-

THE ROYAL FAMILY.

Superscription. — To the Queen's Most Excellent

Majesty.

Commencement. - Madam; May it please your Majesty.

Conclusion.—I remain, Madam, with the profound-est veneration, Your Majesty's most faithful subject and dutiful servant.

PRINCES OF THE BLOOD ROYAL.

The Sons and Daughters, Brothers and Sisters, Uncles and Aunts of the Sovereign.

Sup.—To His (Her) Royal Highness the Prince of Wales (Princess Helena).

Comm.—Your Royal Highness.
Con.—I remain, with the greatest respect (I have
the honour to be), Your Royal Highness's most obedient

Other branches of the Royal Family.
Sup.—To His Royal Highness the Duke of Cambridge.

Comm.

Com.—I remain, with the greatest respect, Your Royal Highness's most humble and obedient servant.

NOBILITY AND GENTRY. Duke or Duchess.

Sup.—To his Grace the Duke (her Grace the Duchess) of Cleveland.

His Grace

The Duke of Cleveland.

Comm .- My Lord Duke (Madam).

#### Addresses

Con.—I have the honour to be, My Lord Duke (Madam), Your Grace's most devoted and obedient servant.

Marquis or Marchioness.

To the Most Noble the Marquis (Marchioness) of Normanby,

Comm.—My Lord Marquis (Madam).
Con.—I have the honour to be, My Lord Marquis, Your Lordship's (Madam, Your Ladyship's) most obe dient and most humble servant. Earl or Countess.

Sup.-To to Sandwich. -To the Right Honourable the Earl (Countess)

Comm.—My Lord (Madam).

Can.—I have the honour to be, My Lord, Your Lordship's (Madam, Your Ladyship's) most obedient and very humble servant.

Viscount or Viscountees. -To the Right Honourable Lord Viscount (Lady Viscountess) Torrington. Comm. and Con. same as Earl's.

Baron or Baroness.
Sup.—To the Right Honourable Lord (Lady) Byron. Comm. and Con. same as Earl's.

YOUNGER Sons of Earls, and ALL the Sons of Viscounts and Barons.

Sup .- To the Honourable Walter Jocelyn.

Conn.—Honoured Sir.
Con.—I have the honour to be, Honoured Sir, Your most obedient and very humble servant.

Baronet and His Wife.

Sup .- To Sir William Welby, Bart. (Lady Welby).

Comm.—Sir (Madam).
Con.—I have the honour to be, Sir, Your most humble and obedient (Madam, Your Ladyship's most obedient and very humble) servant.

Knight and His Wife.

Sup .- To Sir John Ratcliffe (Lady Ratcliffe).

Comm. and Con. as preceding.

Esquire. This title is now given to every man of position and respectability; but persons entitled to superior consideration are distinguished by "&c. &c. &c.,"

added to their superscription.

The wives of Gentlemen, whea several of the same name are married, are distinguished by the Christian name of their husbands; as Mrs. John Harper, Mrs.

William Seymour.

Privy Counsellors have the title of Right Honourable which is prefixed to their name thus (the Esq. is omitted after their names):—

Sup.—To the Right Honourable William Ewart Gladstone, M.P.

Comm.—Sir.

Con.—I have the honour to be, Sir, Your most obedient very humble servant.

Archbishop.
Sup.—To His Grace the Archbishop of York.

Conm.—Your Grace.
Con.—Iremain, Your Grace's most devoted obedient

Bishop.

Sup.—To the Right Reverend the Bishop of Lincoln.
Comm.—Right Reverend Sir.
Con.—I remain, Right Reverend Sir, Your most obedient humble servant.

Doctor of Divinity.

Sup.—To the Beyerend James Williams, D.D., To the Reverend Dr. Vivian.

Comm.—Reverend Sir.
Con.—I have the honour to be, Reverend Sir, Your most obedient servant.

Dean.

-To the Very Reverend the Dean of St. Paul's; To the Very Reverend Henry Milman, D.D., Dean or, To the Vo

Comm.—Mr. Dean; or, Reverend Sir.—Con.—I have the bonour to be, Mr. Dean (or Reverend Sir), Your most obedient servant.

Addresses Con .- I have the honour to remain, Reverend Sir, Your most obedient servant.

Clergymen.
Sup.—To the Reverend Thomas Dymoke.
Comm. and Con. same as the preceding.

\*\*\* If a Bishop or other Clergyman possess the title of Right Honourable and Honourable, it is prefixed to his Clerical title.

When Baronets and Knights have clerical titles, it is

When hardness and Magness and Right Reverend placed first.

Sup.—To the Right Honourable and Right Reverend the Lord Bishop of Bath and Wells.

Sup.—To the Right Honourable and Reverend the Lord Bishop of Carlisle.

Sup.-To the Right Honourable and Reverend Lord

Wriothesley Russell, M.A.

Sup.—To the Honourable and Reverend Baptist

Wriothesley Nocl, M.A.
Sup.—To the Reverend Sir George Prevost. Bart.,

No elerical dignitary confers title or rank on the wife of the dignitary, who is simply addressed Mistress, unless possessing a title in her own right, or through her husband, independently of his clerical rank.

JUDGES, &C.

Lord Chancellor.

Sup.—To the Right Honourable Lord Hatherley, Lord High Chancellor of Great Britain. Rolls.

Sup .- To the Right Honourable the Master of the

Chief Justice.

Sup.—To the Right Honourable Sir A. Cockburn,
Chief Justice; or, the Right Honourable Lord Chief
Justice of the Court of Queen's Bench.

To

The Rt. Hon. Sr W. Bovill,

Lord Chief Justice

of the Court of Common Pleas.

The Chief Justice of the Court of Common Pleas, and the Chief Baron of the Exchequer, are addressed in the same form, and are all styled My Lord.

The Puisne Judges, and the Barons of the Exchequer, are Knigh's; but the title of Judge being superior, they should be addressed thus:

Sup.—To the Honourable Mr. Justice Willes. Sup.—To the Honourable Baron Martin.

Serjeant. Sup .- To J. H. Parry, Esq., Serjeant-at-aw. NAVAL OFFICERS.

Admirals have the rank of their flag added to their own name and title, thus :-

own name and title, thus:—
Sup.—To the Honourable Sir Francis William
Austen, Admiral of the White.
If untitled, they are simply styled Sir.
Commodores are addressed in the same way as ad-

Captains are addressed either to "Captain John Adams, R.N.;" or if on service, "To John Adams, Esquire, Commander of H.M.S."

Lieutenants are addressed in the same way.

MILITARY OFFICERS.

All officers in the army above Lieutenants, Cornets, and Ensigns, have their military rank prefixed to their name and title.

Sup .- To General Sir George Brown. Subalterns are addressed as Esquire, with the regiment to which they belong, if on service:

MUNICIPAL OFFICERS.

Lord Mayor.

Sup.—To the Right Honourable the Lord Mayor (The Lady Mayoress) of London, York, Dublin; The Lord Provost (The Lady Procost) of Edinburgh,
Comm.—My Lord (Madam).

The Mayors of all Corporations, with the Sheriffs, Aldermen, and Recorder of London, see styled Right Worshipful; and the Aldermen and Recorder of other Corporations of the Corporation Corporations, as well as Justices of the Peace, Worchipful.

Ambassadors have Excellency prefixed to their other titles, and their accredited rank added.

taties, and their accredited rank added.

Sup.—To His Excellency Baron Brunnow, Ambassador Extraordinary and Pleuipotentiary from H.I.M.

(His Imperial Majesty) the Emperor of Russia.

Sup.—To His Excellency the Right Honourable H.

Gaprie Elliot, Her Britannic Majesty's Ambassador Extraordinary and Plenipotentiary to the Sublime Ottoman Porte.

 $T_{\alpha}$ 

His Excellency

The Right Hon. H. George Elliot, H.B.M. Ambassador Extraordinary and Plenipotentiary.

To the Sublime Ottoman Porte.

Comm.-Sir.

Con.—I have the mour to be, Sir, Your Excellency's most humble obedient servant.

The wives of Ambaseadors have also Excellency added to their other titles.

Envoys and Charges d'Affaires are generally styled

Excellencies, but by courtesy only. Consuls have only their accredited rank added to their names or titles, if they have any.

Addresses to Government Departments and Public Companies;—

Queen in Council. All applications to the Queen in Council, the Houses of Lords and Commons, &c., are by Petition, as fol-

lows, varying only the title:—

To the Queen's Most Excellent Majesty in Council,

The humble Petition of M. N., &c., showeth That your Petitioner .

Wherefore your Petitioner humbly prays that Your Majesty will be graciously pleased to

And your Petitioner, as in duty bound, will ever pray.

Lords and Commons.

Comm.—Gentlemen.
Con.—I have the honour to be, Gentlemen, &c.
Victualling and Auditing Offices.
To the Commissioners for Victualling Her Majesty's Navy.

Sup.—To the Commissioners for Auditing the Public

Sup. Accounts.

Comm. and Con. same as preceding.

Sup .- To the Commissioners of Her Majesty's Customs.

Adhesive Plaster

Excise Office. Sup.—To the Commissioners of Excise. Tax Office.

Sun .- To the Commissioners of Taxes.

Stamp Office. Sup.-To the Commissioners of Stamps. Bank of England.

Sup.—To the Governor, Deputy-Governor, and Court of Directors of the Bank of England. East-India House.

-To the Court of Directors of the United Company of Merchants of England, trading to the East Indies.

Comm. and Con. of the above same as Navy Office

and Ordnance.

ADDUCTOR MUSCLES, ad-duk'-tor (Lat. adduce, 1 draw towards), in Anat., are those muscles which draw the parts to which they are attached together. They are opposed to the abductor muscles. (See ABDUCTOR

ADELPHOUS, ä-del'-phus (Gr. adelphos, a brother), in Bot., a word used to denote the union of the filaments of the stamens in certain flowers. The number of bundles formed by the union of the filaments is indicated by a Greek numeral prefixed to the word. Thus, when all the filaments join together in a single bundle, as in the mallow, the stamens are monadelphous. When the filaments unite so as to form two bundles, the stamens are diadelphous. The formation of three bundles is expressed by the term triadelphous; and of any greater number, by polyadelphous. ADET, ā-dept' (Lat. adipiser, I obtain), in Alchemy, was the special title given to those alchemists who were

supposed to have attained the grand object of their labours, or to have discovered the transmutation of

metals, and the philosopher's stone.

ADRECTED EQUATIONS. (See AFFECTED EQUATIONS.)
ADHERENT, "id-he'-rent, in Bot., a term applied to
a calyx or perianth, the tube of which adheres more or less to the ovary, as in the flowers of theiris, gooseberry, and myrtle.

Adhesion, ad-he'-shun (Lat. adhærere, to stick to), in Phy., a term applied to the property possessed by certain fluids and solids of becoming attached to each other when brought into contact. Adhesion is frequently confounded with cohesion, which is generally taken to mean the force which keeps the particles of the same body in close union. The examples and uses of adhesion are too familiar and numerous to need mention in detail. It will be sufficient to notice those cases where it is likely to be confounded with cohesion, atmospheric pressure, or chemical affinity. If metals are dipped into mercury, an adhesion of the particles of mercury, differing in force in different metals, takes place. This is evidently the result of metals, takes place. This is evidently the result of chemical affinity, as those metals which most readily chemical sumity, as those metals which most readily form amalgams exercise the greatest attraction for the mercury, gold being at the top of the scale, and iron and cobalt at the bottom. If two pieces of lead are scroped clean and pressed together, they adhere with considerable force, from the cohesion of their particles. When two flat glass plates are pressed together, the cause of adhesion is evidently atmospheric pressure. Friction is the result of the adhesive than the state of the second property of the force existing between bodies, and is generally greatest In machinery, between those of similar constitution. grease, oil, plumbago, or French chalk, is used to lessen the grinding action of moving bodies, on account of the small amount of cohesion existing between their molecules. When parts of machinery rub against each other, they are always made of different metals, for the reason above mentioned. Iron, working in gun-metal, is generally found to produce the least amount of friction. (See Conesion, Friction.)

ADITED A. THE COLUMN OF THE CO tion, by seraping or paring, in surfaces which it is desirable to unite. This tendency of inflamed sur-faces to adhere when in contact is sometimes troublesome, as in inflammations of serous membranes.

Annesive Plaster, plaster, commonly called strapping-plaster, is used to protect raw surfaces, and

## Adiantum

for dressing outs, wounds, and ulcers. It is a gentle external stimulant, and assists the healing process. It is composed of lead-plaster (a mixture of oxide of lead and olive-oil) melted over a slow five, with powdered resin mixed with it in the proportion of six parts of lead-plaster to one part of powdered resin.

ADIANTEM, ai-di-di-tum (Gr. adianton), in Bot., the Maidenhair genus of ferns, including some sixty species, mostly tropical. Two are found in temperate regions, namely, Adiantum capillus-Veneris, the true maidenhair; and A. pedatum, the Canadian maidenhair. The former, which has obtained its name on account of the colour and extreme fineness of its stem and nerves, is found in Scotland and Wales, growing on damp rocks; and its elegant fronds make it a great favourite with collectors. Syrup of capillaire is properly prepared by adding sugar and orangeflower-water to prepared by adding sugar and orangeflower-water to an infusion of maidenhair.

ADIAPROBRIES, aid-itf's-rites (Gr. adiaphoros, in-different), a name given to Melancthon and the party of which he was the leader, because of their submission upon indifferent points to imperial edicts. The imposition, by Charles V., in 1549, of an edict called the Interim, proposing a temporary accommo-dation of the dissensions between the Protestants and Papists, till the dispute could be decided by a council. was the origin of the name. Flavius and the primitive Lutherans opposed Melancthon in the controversy. The two principal questions debated were, first, whether it was lawful to submit to the opponents of truth, even in unimportant points; and, secondly, whether, granting that it was so, the matters upon which the Interim required submission were unimportant.

whether, granting that it was so, the matters upon which the Interim required submission were unimportant. The point in the edict chiefly insisted on was the doctrine of justification by faith. Melaucthon, after the death of Luther, adopted more moderate views than the great Reformer. From this controversy other divisions sprung, and from these divisions many of the schisms among Protestants had their origin.

AD INFINITUM, in-f-ni'-tum (Int. ad, to, and infinitus, unlimited), interminable, without end.

AD INGURENDUM, in-qui-reu'-dum (Lat. to be inquired into), in Law, is a judicial writ commanding inquiry to be made of anything relating to a cause or matter depending in the queen's courts.—Ref. Reg. Judic: Cowell; Blount.

ADIPOCEER, dd'-i-po-seer (Lat. adeps, soft fat, cera, wax), a term applied by the French savans of the last century to a product of the decomposition of animal substances in moist earth or under water. It is principally margarate of animonia, and is a fatty body, somewhat resembling spermaceti. Immense masses of it were found on the removal of the bodies from the burisl-ground called la Cimetière des Innocens, at Paris, in 1786 and 1787. Several interesting experiments were made on this substance by M. Fourcroy, at the time of this discovery, the results of which he read in 1789s. Adprosed Tiesux. åd'-i-pose (Lat. adeps. soft fat), in which he read in 1789.

which he read in 1793.

Additional Tissue, add-i-pose (Lat. adeps, soft fat), in Physiol., comprises an aggregation of minute cells filled with fat, which they appropriate from the blood. This tissue serves several important purposes in the animal body; filling up interstices, forming a pad or cushion for the support of the movable parts, and assisting in the retention of heat.

ADT, &d'-it (Lat. aditus, an avenue, an entrance) in Mining, the entrance to a mine, generally driven horizontally into the side of a hill. Formerly mines were worked by vertical shafts, but now adits are

always used where practicable.

ADJECTIVE, add fak-tiv (Lat. adjectus, added to), in Gram, is the name of one of the parts of speech or classes into which grammarians have divided words. Classes into when granularisms have divided words. It is so called because it adds to, or qualifies, the meaning of the noun with which it is joined; as, a good man, a large house, a white horse. In English a noun frequently takes the place of an adjective; as, a gold

requently takes the place of an adjective; as, a gold watch, the paper duty.

ADJOURNMENT, adjurn'-ment (Lat. ad, to, and Fr. jour, a day), putting off a court of meeting to another time or place. Adjournments of parliament differ from proregations in this,—that the houses can adjourn of the court of th of themselves, but a prorogation is done only by the sovereign. (See Prorogation.)

# Adjutant

ADJUDICATION, ad-joo-de-kai-shun (Lat. ad, to, and judico, I judge), a process known to the law of Scotland. It implies the means by which real property and its accessaries are transferred to a creditor by a debtor, from a heir to a devisee, or from a vendor, who may have failed or refused to convey, to the vendee. It is also the declaration of a commissioner in bankrupitary, that a near-def has become switcht to the vendee. It is also the declaration of a commissioner as bankruptcy, that a person has become subject to the bankrupt law, and by which he adjudicates him bank-

bankrupt law, and by which we have the rupt accordingly.

Additional accordingly which (Lat. ad, to, and junctus, joined), a term used in Phil. to signify something added to another thing, between which there is no natural affinity. In the Academy of Paris, adjuncts were members attached to a particular science.

Additional additional according to the second particular science and justify the second particular science.

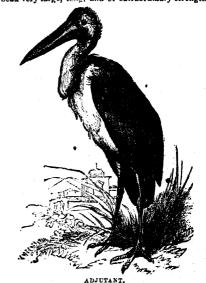

just), a term used in Marine Insurance to signify the ascertainment of the exact amount of indemnity to which the insured is entitled under the policy, when all deductions and proper allowances have been made.

Adjurage, or Ajurage, ad-ju-taj (Lat. adjuvo, I assist), in Hyd., signifies the tube of the mouth of a

jet d'eau, through which the water is conveyed.

ADJUTANT, üd-ju-tant (Lat. adjutor, an assistant), a military officer, whose duties are to assist the major in all matters relating to the ordinary routine of discipline in the regiment. The office confers no separate rank, but is usually given to one of the subaltern officers.—An ADJ.-GENERAL stands in the same relation to a general that an adjutant does to a major. and is to the army what the adjutant is to a regiment.

ADJUTANT, in Orn., a gigantic orane, belonging to the Ardeida or Heron fam. Its scientific name is Leptoptitios argula. Charac. The adjutant stands five feet high; the neck and head are almost bare; the beak very large, long, and of extraordinary strength.

Beneath the beak hangs a downy pouch like a dewisp, which the bird has the power of inflating. The upper part of the adjutant is of an asb-grey colour, the under part white. Its voracity is wonderful: it can swallow part of the adjutant is of an asb-grey colour, the unusation part white. Its voracity is wonderful: it can swallow a fowl, a rabbit, or a leg of mutton, at a mouthful; and it is extremely useful in devouring all sorts of carrion. In Calcutta it is called the Scavenger, and any person wantonly killing one is fined, 50 rupecs. In their wild state these birds live in companies. Seen near a river, and from some distance, Dr. Lathem remarks that they may "well be taken for cances upon the surface of a smooth sea. or for men and women picking up of a smooth sea, or for men and women picking up shelldsh or other things on the beach." Hab. The warmer parts of India.

# Ad Libitum

An Libitum, lib'-i-tum (Lat., at pleasure), in Music, a term signifying that the performer may introduce into the composition any addition of his own, according to his fancy.

ADMEASUREMENT, & d-mesh'-ure-ment (Lat. admensu-ratio, mensure, I mete or measure), in Law, is a writ which lies in dower. Admensuratio dotis, where a man's widow, after his death, holds more land as dower than widow, after his death, holds more land as dower than of right belongs to her, or the heir or his guardian do not assign her dower within the term of guarantine, or forty days, or assign it unfairly, the writ then goes to the sheriff to assign it. It formerly was used also in cases of pasture (admensionate posture), where those who had common of pasture appendent to their free-hold estates, or common by vicinage, and any one or more of them surcharged the common. The latter writ in abolished.—Ref. Bl. Com. vol. i. b. 2, pt. 1, ch. 4; vol. iii. b. 5, ch. 8; Reg. Orig. 156, 171; Termes de la Ley.

ADMMASUREMENT in Mar. the mossance of them.

ADMEASUREMENT, in Mar., the measurement made to ascertain the tomage of a ship.

ADMINISTRATION, and AUMINISTRATOR, dd-min'-is-trai'-shun (Lat. administratio, aid, assistance, agency). The office of an administrator is to administer or dis tribute the goods of a person who has died without making a will; or, having made a will, without ap-pointing an executor: in such cases, letters of administration are taken out of the principal or a district registry of the Court of Probate. Administration is likewise used for managing the affairs of minors, lunaties, &c. In ecclesiastical concerns, it means the temporal and spiritual powers of a beneficed clergyman. Among anatomists, it signifies the act of dissection, particularly of the muscles.

ADMINISTRATION, in Pol., denotes the persons in a state intrusted with the general superintendence of affairs and the execution of the laws. In England the

term is usually employed to designate the Privy Council, especially that portion of it known as the Ministry. ADMIRAL,  $\bar{a}d'$ -mi-ral, the title of the highest class of naval officers. The word is said to be derived from the Arabic Emir or Amir, lord or chief. In the British navy there are three kinds of admirals,—of the Red, of the White, and of the Blue; so called from the colour of their flags; whence they have all the general title of fla, officers. There are, further, three grades in each of these classes,—Admirals, who bear their flag at the main-top-gallant masthead; Vice-admirals, at the foretop-gallant masthead; and Rear-admirals, at the mizentop-gallant masthead. The title Admiral of the Fleet is merely an honorary distinction. A full admiral ranks with a general, and one who is actually the com-mander-in-chief of a fleet, with a field-marshal in the army; a vice-admiral ranks with a lieutenant-general, and a rear-admiral with a major-general in the army. The rates of full or sea-pay of admirals are,—admiral The rates of full or sea-psy of admirals are,—admiral of the fleet, £6 per day; admiral, £5; vice-admiral, £4; rear-admiral, £3. An admiral commanding inchief receives £3 per day additional when his flag is flying within the limits of his station. By an order in council (1851), the number of active flag-officers was reduced to 99, exclusive of admirals of the fleet, of whom there is, at present, one; being, 7 admirals, 9 vice-admirals, and 17 rear-admirals in each class. Besides these, there are, at present, about 200 flag-

officers on reserved half-pay, or retired.

ADMIRAL, in Conch., a beautiful shell of the Volute species, and comprising four kinds,—the Grand-admiral, the Vice-admiral, the Orange-admiral, and the Extra-admiral. The first is of a fine white enamel, with bands of yellow finely turned about the head, and the clavicle excited. It is principally characterized by a denticulated line along the centre of the large yellow band: this distinguishes it from the Vice-admiral. The Orange-admiral has more yellow; and the bands of the Extra-admiral run into each other.

ADMIRALTY, ud'-mi-ral-te, the office of lord high ad-ADMIRAITY, add-mi-ral-te, the office of lord high admiral, or of the commissioners appointed to discharge that office. The Admiralty Court is usually termed the Instance Court, to distinguish it from the Prize Court, which is only constituted in time of war. It has cognizance of all civil maritime affairs, which are determined according to the civil law, so far as the same be not inconsistent with the common, statute, or international law.

## Adoration

ADMIRALTY COURT (see ADMIRALTY).

ADMIRALTY DROITS (Fr. droit, right, prerogative), certain rights belonging to the Crown by virtue of its prerogative, and connected with the sear; as, greek

ADMITTANCE, id-mit'-tinse (Lat. admissio, admitto, I put in, I present with), in Law, is the giving possession of a copyhold estate; and is of three kinds:—
1. Upon a voluntary grant by the lord of a manor, where the land has eschested or reverted to him. where the land has eschested or reverted to him,—
2. Upon surrender by the former tenant,—3. Admittance by descent, which is where an heir is tenant
immediately on the death of his anestor. (Ref. Wood,
b. 2, c. 1.)—Admittance of a Clerk is when a patron of a
church being presented to it, the bishop, upon examination, admits the clerk by saying Admitto te habilem. It is, properly, the ordinary's declaration that he ap-proves of the presentee to serve the cure of the church to which he is presented.—Ref. Co. Litt. 344a.

ADMONITIO FUSTIUM, ad-mo-nish'-i-o, among the an-

cient Romans, a military punishment, not dissimilar to the modern whipping, except that it was performed

with vine branches.

with vine-branches.

ADMONITION, or Monition, dd-mo-nish'-un (Lat. moneo, I remind), a term used in Eccl. Law to denote the warning given to an offender before excommunication, or to a suitor before proceeding against him in panam continuaciae, or for default.

ADMATS, dd'-nuit (Lat. ad, to, and natus, a growing),

in Bot., a term applied to certain portions of a plant when they adhere to other portions; thus, when the stipules are united to the petiole, as in the leaf of the rose, they are called adnate stipules: when the anther is closely attached to the filament, as in the flower of the buttercup, it is said to be an adnate anther. term adherent has the same signification.

term adherent has the same signification.

Addented and a sponder of the consisted of a dactyle and a sponder or trochee; as rara juventa. It was so called from being first used in the elegies on Addents, the lover of Venus.

Addented and Addented and Addented and Addented and the banks of the Adonis, a river of Phomicia, where Addented and the or Themmus, as he is termed according to the Oriental style, was supposed to have received his death-wound. At certain periods of the year this river becomes tinged with a high red colour, caused by the washing up of portions of red earth. This discoloration of the waters was ascribed by the ancients to a supposed sympathy possessed by the river for the death of the lover of Venus. Milton, in his "Paradise Lost," thus beautifully alludes to the fact:—

> "Thammuz came next behind, Whose annual wound in Lebauon allured The Syrian damsols to lament his fate, In am'rous ditties, all a summer's day: While smooth Adonis from his native rock Ran purple to the sea, supposed with blood Of Thammuz, yearly wounded."

Ref. Calmet's Dictionnaire de la Bible, art. "Thammuz."

ADONIS, ā-do'-nis, in Bot., a genus of plants belonging to the Buttercup order, or Kanunculacea. The common adonis, or pheasant's-eye, is a favourite annual in English gardens. Its flower is of a bright scarlet, with a black spot or eye in the centre.

ADOPTION, ā-dop'-shun (Lat. ad, to, and opto, I choose), the act whereby one man makes another his heir. It was a common custom among the Greeks and Powers as it will be with the Turks and other

and Romans, as it still is with the Turks and other

eastern nations.

ADOPTION CONTROVERSY, a strife which arose in the Church, in Spain, towards the end of the 9th century. The leaders in this controversy were Felix of Urgellis and Elipandos of Toledo, who held that Christ in his human nature was the son of God only by adoption. This doctrine was condemned at an assembly summoned by Charlemagne, at Ratisbon, in 792; at the council of Frankfort-on-the-Maine, in 794; and at the synod of Aix-la-Chapelle, in 799. The controversy ceased on the death of the two leaders.

ADDATION, àd'o-rai'-shun (Lat. ad, to, and oro, I pray), a term denoting the act of worshipping the Supreme Being. It was anciently done by prostrating the body with the face to the earth, as an action naturally

#### Adores

flowing from the despest humility of mind; the con-cealment of the face being strongly and most appropri-stelly expressive of the worshipper's total unworthiness so much as to lift up his eyes before the great object of his worship.

ăd-o-re'-ă, a term of various acceptation ADOREA, among the Romans, sometimes signifying grain in general, at others a kind of cake offered in sacrifice; and again it was used to denote the gratuitous distribution of corn; whence it became applied to all forms of

reward.

Abox., a-dox'-ā (Gr. a, without, and doxa, glory), in Bot, the Moschafel, a genus of plants belonging to the Lyy ord, or Aralica. The typical species, at noschatellian, is a carious inconspicuous little plant, having a tuft of pale green flowers.

AD QUOD DAMNUM, däm-num (Lat., to what damage), in Law, a term applied to a writ issued by the Crown, to inquire whether a royal grant, such as a market, fair, &c., would be to its damage.

ADRAGATE. (See TRAGACANTE.)

ADRIFT, ü-drift' (Ang. Ssx.), in Mar., a term signifying that a vessel has broken loose from her moorings, and is driven to and fro by the winds and waves.

ADSIDELLA, ü-si-del'-lä, among the Romans, the table at which the flamens sat during the sacrifices.

ADULARIA, "dd'-u-lui'-ri-ü, in Min., a kind of felspar, resembling clear transparent glass. It is found in volcanic districts, and is named from Mount Adula, in Switzerland.

ADULT, &-dult' (Lat. adultus, grown up), in a gene-ADULT, d-dult' (Lat. adultus, grown up), in a general sense, a term signifying anything grown up to, or arrived at maturity. It is also applied to that period of human life which extends from manhood to old age.

ADULTERITION, ä-dul-te-rai'-shun (Lat. adultero, I falsify, corrupt), the introduction of cheap and often injurious materials into natural and manufactured.

factured products, for the purpose of increasing the profits on their sale. This practice is still unfortuprofits on their said. This practice is som unfortunately carried to a great extent, though a special act of parliament has been passed to check it. Full particulars of the most common adulterations will be found under the heads of articles of food. (See FLOUR, BREAD, ARROW-ROOT, &c.) When the adulteration consists of a mineral substance, its nature is readily determined by chemical analysis; but when it consists of an organic products the aid of the microscope is required to find it out. The practice of aduteration has frequently led to fatal results.

ADULT-SCHOOLS, establishments for the instruction of those persons who have not been educated in or those persons was have not over educated in their youth, in the elementary branches of know-ledge. The Rev. T. Charles, a clergyman of Meriomethalire, finding that several of the grown-up parishioners attending his Sunday-school, disliked to learn by the side of children, first formed an adultschool, in 1811; and at about the same time, though without any connection or correspondence with the establishment in Wales, Mr. W. Smith opened a school in Bristol. Smith was a doorkeeper at a dissenting chapel, and out of his weekly wages of 18s. gave 3s. towards the expenses of the school. A society was afterwards formed for the advancement of his beneatterwards formed for the southercement of his bene-volent intentions, and adult-schools were established in various parts of the country,—in Ipswich, Norwich, Salisbury, Sheffield, Plymouth, Uxbridge, and else-where. (Ref. Pole's History and Origing) Adult Schools.) In the present day adult-schools rather enable young men who have received the rudiments of education, to make further progress, than teach the totally unlettered. They are to be found in several mechanics' institutions, in the Working Men's College, and other places of a similar description. At King's College, London, the evening classes, which give the privilege of a university examination, are invariably well stiended. To cite a proof of the necessity of such schools for the moral and includental subjects of the house of the necessity of such schools for the moral and intellectual culture of the labouring classes:— In 1841, 33 per cent. of the men, and 49 of the women, could not write their names on their marriage. In 1856, the percentage was reduced to 29 of the men, and 40 of the women.

ADUBERATION, &d-um-brail-shum (Lat. ad, to, and usebra, a shadow), in Her., denotes that the shadow only of a figure is outlined and painted of a darker

colour than the field.

## Advertisement

AD VALOREM, và-lor'-em (Lat., according to the value), a term used for those duties or customs which are paid according to the value of the goods.

ADVANCE, advans, in Com., a term applied to money paid in part, or wholly, before the delivery of goods purchased, the execution of work, or the performance

of any business.

ADVANCED DITCH, or MOAT, a term used in Fort, to denote the trench surrounding the glacis or esplanade

of a place.

ADVANCED GUARD, or WANGUARD, is the first line or division of an army, placed in order of battle. It also denotes a party of cavalry stationed before the main guard.

Advent, as -vent (Lat. adventus, coming), a term applied by the Christian church to certain weeks before Christmas. Auciently, the season of Advent consisted of six weeks, and this is still the duration of it in the Greek church. In the Romish church, however, and in the Protestant churches that observe Advent, it only lasts four weeks, commencing with the Sunday nearest St. Andrew's day (Nov. 30), cither before or after. It is appointed to be observed as a season of devotion, being intended to commemorate the coming of Christ in the flesh, and to direct the thoughts to his

of Christ in the flesh, and to direct the thoughts to his second coming. This season was observed with great austerity by the primitive Christiaus.

ADVENTITIOUS ROOTS, in Bot., roots which are not produced by the direct elongation of the radicle of the embryo. They generally spring from the true roots, from suckers, runners, builds, and other subterranean modifications of the stem. Adventitious roots are sometimes given off by the stems and branches, and are then termed agrial roots. In the Indian fig, or banyan, and the mangrove, these roots descend to the ground, and help to support and nourish the parent stems.

stems.

ADVENTURE, BILL OF, ad-ven'-lure (Fr. aventure, hazard), a writing which is signed by a merchant. and which states that the goods on board a vessel ere the property of another, who is to run all risk, the merchant only binding himself to account for the produce.

ADVENTURERS (Fr. aventurier), in Com., those traders who formerly undertook the discovery of distant lands, and the settlement of far-off colonies, and formed themselves into a company called the Merchant Adventurers. The term was also applied to a mer-chant vessel trading without a license within the

boundaries of a company's grant.

Advers, ad-rerb, in Gram., a part of speech, or class of words, so called from being generally joined to verbs, like adjectives to nouns, for the purpose of qualifying ther meaning. Adverbs are also joined to adjectives and other adverbs. According to their signification, adverbs are divided into those of number, order, time, place, quantity, manner, &c.; as, once, firetty, now, here, nuch, well. Many adverbs are formed from adjectives by adding the termination ly; as, wise, wisly.

ADVERSA, ad-ner'-sa (Lat. ad, to, and versus, turned towards), in Numis., a term applied to those coins

wherein the heads are seen facing each other.

ADVERSARIA, dd'-ter-sai'-ri-a, a term employed by
the ancients to denote a kind of common-place book, or journal, in which were inserted remarkable occurrences. At the present day the term is more particularly used among men of letters, to designate a kind of common-place book, wherein is entered whatever may occur worthy of notice, whether in reading or conversation.

ADVERSATIVE, üd-ver'-sa-tif, in Gram., a term denoting a difference between what precedes and that which follows it; as in this sentence, "He is benevolent, but poor;" the word but is an adversative conjunction.

poor;" the word but is an adversative conjunction.

ADVERTISHMENT, adver-tis-ment (Fr. avertisement),
an announcement or notice of any kind, generally such
as are published in newspapers, &c. The first English
advertisement that can be found is in the Imperial
Intelligencer for 1649, and relates to stolen horses.
In 1712 a tax was first imposed upon advertisements,
In 1833 the tax was reduced from 3s. 6d. to 1s. 6d. in
Great Britain, and from 2s. 6d. to 1s. in Ireland; and
in 1853 it was abolished altogether. In 1832 (the year
before the reduction) the total number of newspaper
advertisements in the United Kingdom was 921,943;

## Advice

viz., 787,649 in England, 108,914 in Scotland, and 125,380 in Ireland,—the duty amounting to £172,570. In 1841 the total number of advertisements was 1,778,957, and the duty amounted to £128,318; in 1851 the latter had risen to £175,694. Since the abolition of the duty, the number of advertisements has vastly increased, though there is no means of arriving at very a probable estimate of their number. The increase manifests itself not only in old-established papers, as the Times, which has more than doubled the number of its advertisements, but in the great number of of its advertisements, but in the great number of papers that have spring into existence since that time, some of which daily contain a great number of advertisements. One of these, the London Daily Telegraph, had on 13th November, 1861 (an average number), 568 advertisements. The Times (taking average numbers) contained, on 1st February, 1853, 1,086 advertisements; and on 21st November, In almost every case it is the advertisements 2,480. In amost every case it is the advertisaments by which newspapers are supported, the sales even of the higher-priced papers being insufficient to pay for the paper, printing, editing, &c. The sums annually spent by some who issue advertisements are very considerable. We give the following, on the authority of the writer of an interesting article on this subject, in the writer of an interesting article on this student, in the Quarterly Review for June, 1855:—Holloway (pills, &c.), £30,000; Mosea & Son, £10,000; Rowland & Co. (Macassar oil, &c.), £10,000; De Jongh (cod-liver oil), £10,000; Heal & Sons (bedsteads and bedding), £6,000; Nichol (tailor), £4,000.
ADVICE, ăd-vice' (Fr. avis), in Com., is information

respecting trade communicated by letter; thus, an respecting trade communicated by letter; thus, an advice is generally sent by one banker or merchant to another, to inform him of the drafts or bills drawn on him, with full particulars of their sum, date, to whom made payable, &c. This document is termed a "letter of advice," and the practice prevents mistakes, and at times detects forgeries; for when bills are presented for payment or acceptance, they can be refused

to be honoured for want of advice.

AD VITAM, AUT CULPAM, a phrase signifying that an office is to be held by a person till his death, or, more properly, during his good conduct.

properly, during his good conduct.

AUVOCATE, 'id'-vo-kait' (Lat. advocatus, one who gives legal assistance), among the Romans, one who pleaded the causes of others. The term is still used in those countries where the Roman law prevails. In the courts of civil law, in England, he is required, before discharging his duties, to take the degree of D.C.D. in one of the English universities. In Edinburgh there is a Faculty of Advocates, who constitute the Bar of Sootland. The Lord Advocate is a state officer in that country, who pleads the king's causes. The Advocates' Library, belonging to the faculty, is, perhaps, the third largest in the kingdom, that of the British Museum and the Bodleian only being considered superior. (See Library.)

that of the British Museum and the Bodiesh only being considered superior. (See Library.)

ADVOCAME FISCAL (Lat. fisci advocatus), an officer under the Roman emperors. He pleaded causes belonging to the private treasury.—Advicates consistorial, officers in the consistory at Rome, who plead in cases of consisting to the disposal of hyperficial.

of opposition to the disposal of benefices

ADVONSON, id-low-son (Ang.-Nor.), in Eccl. Law, the right of patronage, or of presenting to a benefice. The person enjoying this right is called the patron, who is bound to protect the interest of the church as well as the rights of the incombent whom he has presented to it.

ADYTUM, a-di'-tum (Gr. adyton, a recess), in Arch., a term in use among the ascients, signifying the most sacred part of their temples, to which none but the priests had access, and from which the oracles were delivered. The Sanctum Sanctorum, or most holy place of the temple of Solomon, at Jerusalem, was its adytum. Strabo describes an adytum of an Egyptian temple under the name of secos. In the small temple

at Pompeii there is an adytum in good preservation.

Adze, ids (Sax. adece), a cutting-tool, of the axe kind, having its blade thin and arching, and its edge at 

#### Almeid

Acidium, s-sid'-i-um, in Bot., a genus of microscopic parasitic fungi. There are numerous species, some or which infest useful garden plants, such as the mint and the gooseberry.

ADEs, e'dees (Lat, a building), in Arch., among the Romans, signified an inferior kind of temple, dedicated

Homes, signined an interior and or temple, against to some detry, but not by the augurs.

ÆDILE, e'-dile (Lat. ædes, a building), the term applied to certain Roman magistrates, who had the superintendence of public buildings, highways, bridges, weights and measures, &c. They had also the charge of the public morals, and the regulation of theatrical performances and diversions. They were four in numperformances and divoraions. They were four in num-ber, two plebeian and two curule; the former elected from the common people (plebs), the latter at first from the patricians, but afterwards from plebeians and patricians promiscuously. They were so called from their giving judgment on ivery seats (sella curules). Julius Cassar added two more, termed addles cereales, who had the inspection of the granaries. The addless had great recover in the state and save allegand the the robe of honour (toga pratexta).

AEGAGBUS, e-gai-grus, the Paseng of the Persians, a

wild species of Ibex. (See GOAT.)

Man species of near, (see GOAL).

Ægiceras.

Ægiceras.

Ægiceras.

This includes but one genus, of which there are five species. These plants grow near the sea in tropical regions, throwing out adventitions roots into the mud, like mangroves.

ÆGLOOFS, e'-ji-lops, in Bot., a genus of Glumacea, the Grass order. The species Ægilops ovata was formerly supposed to be the origin of all the varieties of cultivated wheat; and it is undoubtedly true that a kind of wheat may be produced by the union of this plant with a species of Triticum. The hybrid, after about twelve years' cultivation, becomes a wheat-bearing grass.

ÆGINETAN ART, e-ji-ne'-tan, the fine arts as executed by the people of Egina, especially sculpture, specimens of which, in the form of casts, are now in the Phigolian saloon of the British Museum. The originals are at Munich, having been purchased by the late king of

Bayaria.

Ægis, e'-jis (Gr. aigis, a goat-skin coat), among the ancient Greeks signified

the shield of Jupiter, by whom it was given Minerva. According to Homer, the shield was covered with the skin of the goat Amalthea. nerva afterwards fixed upon it the Gorgon's head (see Beston's Dict. of Biography), and thus endowed it with the endowed it with the power of turning into atone all those who looked at it. The term was also employed to denote the breastplate of a god, and finally it came to be applied to the cuirass of distinguished persons. In the British Museum there is an armed statue of the emperor Hadrian, which affords an example of the use of the ægis as a breastplate.

AGLE, e'-gle, in Bot., a genus of Aurantiaceæ,

ÆGIS.

the Orange order. The bark of the Æyle marmelos, or Indian bael, has been introduced into this country as a remedy for diarrhous. The rind of its ripe fruit yields an agreeable perfume. ÆGOMANTIA, e-go-mān'-shi-a (Gr. aix, gont, manteia, divination), a term used by the ancient to express a mode

ACCOUNTAGE OF THE USE OF THE ACCOUNT OF THE ACCOUNT

ANEID, e'-ne-id, the celebrated epic poem written Virgil in the time of Augustus Cæsar, which relates

## **Alnigma**

the wanderings of Eneas after the capture of Troy, his arrival in Italy, and his adventures previous to his marriage with Lavinia and settlement in Latium. The poem consists of twelve books. The first six contain a description of the wanderings of the hero; the others of his arrival in Italy, and the war between the Trojans and the natives. It was commenced about A.U.C. 724 or B.C. 30, the author continuing to labour upon it till his death, B.c. 20.

Emgua, e-nig-ma (Gr.), is a Greek term for what is commonly called a riddle. It denotes any dark asying or question, wherein some well-known thing is concealed under obscure or indirect language.

MOUIAN HARP, e-o'-li-an (Lat. Zolus, the god of the winds), a kind of harp formed of a number of catgut strings, tuned in unison, and stretched across a deal box, open at the sides. The box is placed on the sill of a window, and the sash shut down upon it; the wind blowing into the room across the strings produces an harmonious mixture of sounds, resembling a distant choir, rising or falling according to the strength of the blast. The same effect is produced on a grander scale by the wind passing through the wires of a line of telegraph. The Æolian harp is easily made, care being taken to preserve the strings in strict unison. It is generally supposed to be the invention of Father Kircher, the celebrated organ-builder.

ROLIO DIALECT, e-ol'-ik, among Grammarians, one of the five dialects of the Greek tonguo, agreeing in

most things with the Doric dialect.

ABOLIC VERSE, in Pros., a kind of verse, consisting of an iambus or spondee, then of two anapests, separated by a long syllable, and lastly of one long or short

syllable

MOLIFIEE, e-ol'-i-pile (Lat. Æolus, god of winds, pila, a ball), a hollow ball of metal, to which a pipe is attached. On being illed with water, and placed on the fire, the steam issues from the tube with sufficient force to turn a wheel placed within its power. Branca, an Italian mechanician of the 17th century, is supposed 

ÆQUILATERUS. (See EQUILATERAL.) ÆRA. (See ERA.)

ERABIUM, e-rai'-ri-um (Lat.), among the Romans, the term applied to the place where the public money was kept, the care of which devolved upon the questors. Erarium sanctum, a place to contain the moneys arising from the twentieth part of legacies reserved for the use of the state. Erarium pricatum, the emperor's private purse. Erarium Ilithia, the place where the moneys which parents paid at the birth of each child were deposited.

ABRATED WATERS, ai'-e-rai'-ted (Gr. aer, air).—This ARRATED WATERS, at e-rai'-ted (fir. aer, air).—This term is applied to drinks in which water is impregnated with gases by pressure. The best known of these is the so-called sode-water, which generally consists of plain water charged with carbonic-acid gas. This is effected by submitting the water to carbonic acid under a pressure of 30 or 40 lbs. to the square inch, and bottling it off without any diminution of the pressure. On uncorking the bottle, the imprisoned gas is released, and taken into the stomach in the form of bubbles. and taken into the stomach in the form of bubbles. Various mineral constituents, such as soda, potash, lithia, the salts of iron, and magnesis, are often introduced into the water with excellent medicinal effects. Afrated drinks, such as effereecing lemonade, are often impregnated with air only; but this is easily detected by the taste of the gas.

Afratrom of Soils, ai'-e-rai'-shun, is the impregnating them with air, by ploughing, harrowing, &c., so that the air may enter the pores of the earth.

Afrata Bulbs, ai-eer-i-al, in Bot., small conical or rounded bodies of the nature of bulbs, which grow in the axils of the leaves of certain plants. They may be

rounded bodies of the nature of bulbs, which grow in the sxils of the leaves of certain plants. They may be seen in the bulbiferous lily and in the pilewort.

ATRIAL IMAGES. (See MIRAGE and FATA MORGARA.)
ATRIAL LEAVES, in Bot., leaves which grow in the air, as distinguished from submerged leaves, or those which flourish under water.

# Aeronaut

ABRIAL PERSPECTIVE, a term used in Paint to signify the diminution in the colour and brilliance of objects seen at a distance, and which causes them to look more or less remote.

look more or less remote.

ARHAL Roors, in Bot., those adventitious roots which are produced in the air. The little threads which spring from the stem of the ivy, the descending columns of the banyan-tree, and the green fibres thrown out by the curious air-plants, are examples.

AERO-DYNAMICS, av. e-vo-di-ndm'. ike, (Gr. aer, air, and dynamis, power), is the science which treats of properties of acriform fluids in a state of motion.

The causes which disturb the quiescence of the air are very numerous. Currents are created in innumerable ways; amongst others, by the local change of tenperature induced by the presence or absence of the sun; by the permanent difference of temperature between the polar and equatorial regions; and by the rotation of the earth on its axis. It is also effected by the evaporation of the sea and rivers. Aqueous vapour being much lighter than the sir, causes motion in its passage to the cloud region. The science of acro-dynamics is most important in the way of affecting the well-being of mankind. The researches of Admiral Fitzroy have proved that it is quite possible to predict the blowing proved that it is quite possible to predict the blowing of wind from any particular quarter; and, by sero-dynamical calculations, the Admiralty is now able to forward telegrams to different parts of the coast, warning sailors of coming storms. The laws which govern projectiles are properly part of this science. (For a further consideration of this part of the subject, see PROJECTILES; see also RIVLE, GUNNEEY, ANEMOMETER ACQUISTICS 1

METER, ACOUSTICS.)

AEROGRAPHY, ai-e-rog'-ra-fe (Gr. aer, air, and grapho, I write), the description of the nature, properties, and phenomena of the atmosphere. (See ATMOSPHERE.)

AEROLITE, ai'-e-ro-lite (Gr. aer, air, lithos, a stone), a stone fallen from the atmosphere; a meteoric stone. The source of these bodies has greatly puzzled philosophers. Many suppose them to have been projected from lunar volcances to such a distance as to come within range of the earth's attraction; others give them a terrestrial volcanic origin. The generallygive them a terrestria voiceme origin. An egenerally-received opinion is that started by Laplace, who supposes them to be masses of matter,—small planets, in fact,—revolving round the sun, and coming within range of the earth's attraction. This opinion is carried out by the fact of showers of meteors occurring at resident integrals. For example, Aug. 22-13. periodical intervals; for example, Aug. 7 to 12, Nov. 10 to 16, when large quantities of these bodies may be seen nightly in all directions. The heat caused by their passing at an inconceivably rapid rate through the air is sufficient to render them incandescent. They the air is sufficient to render them incandescent. They are mostly of uniform composition, consisting principally of silica, magnesia, and iron, with small quantities of nickel, sulphur, and chromium. Some of them are very large, weighing upwards of 300 lbg. Shooting stars are supposed to be meteoric stones which are consumed by the heat generated in their passage to the earth. Philosophers long disbelieved in their existence. The fact has, however, long been placed beyond doubt by the researches of Laplace, Chladni, and others others.

AEROMANCY, ai'-e-ro-man-se (Gr.aer, air, and manteno, I divine), a term applied to a mode practised by the ancients of predicting future events from certain ap-

pearances in the air.

ARBORNETRY, at'-er-om'-e-tre (Gr. aer, air, and metreo, Imeasure), the art of measuring the air, so as to obtain a knowledge of its bulk, density, &c. The instrument employed to ascertain the bulk of gases, &c., is called un aërometer.

ABBONAUT, ai'-s-ro-nawt (Gr. asr, air, and nautes, a sailor), one who travels in a balloon. The most celebrated acronauts were the brothers Montgolfier, who were the aëronauts were the brothers Montgolder, who were she first to make an ascent in this manner, in 1783; Blanchard, who first crossed the Channel in 1785; Garnerin, to whom we ewe the invention of the parachute; Pilatre de Rozier, who lost his life by imprudently ascending in a Montgoliler balloon, above which was placed a second filled with hydrogen; Madame Blanchard, who was burned during a display of fireworks from the car; and, in our own day, Mr. Charles Green, who has crossed the Channel several times, and has made up-

# Aerophytes

wards of a thousand ascents; Cocking, who was killed by descending in a parachute made of tin tubes a few years since; and, lastly, Mesers. Godard and Poitevin, who risk their lives by ascending on the backs of lions, or swinging on ropes attached to the car.

AECOPHYTES, al'-e-ro-files (Or. aer, air, and phyton, a plant), in Bot., plants having only agrical roots. (See AIR-PLANTS.)

AIR-FLANTS.)
ARROSTATION, al'-e-res-tai'-shun (Gr. asr, air, and stao, I stand), the art of raising bodies into the air by the nied of gases, &c. (See BALLOON.)

ÆRUGO, e-ru-po, the ancient name for a bright green rust or verdigris, produced by the action of the air upon copper, brass, and bronze. The Romans considered that the ærugo added to the beauty of their statues.

ÆRUGO, PORTS - AMERICA PORTS - AMERICA PORTS

ÆRUSCATORES, e-rus-ka-to'-rees, a name given by the ancients to those strolling beggars who obtained money by fortune-telling. The term was also applied to the priests of Cybele and the collectors of taxes.

Es, ee, a bronze coin of the Romans, consisting of the æs rude, æs grave, and æs signatum. The two first were paid by weight, but the last in number. Æs flauum, among the Romans, was used to designate bronze of an inferior description.

ESCHENOMENE, ees'-ki-nom'-i-ne, in Bot., a genus of leguminous plants. The species are numerous, and most of them natives of India. The stems of the Mechynomene paludosa furnish the shole, or Indian ricepaper, and, on account of their extreme lightness, are used for making floats and buoys. Æ. cannabina yields

He fibre known as Duchai hemp.

Asculus, ees'-ku-lus, in Rot., the Horse-chestnut, a genus of the Sospwort order, or Sapindaceae.

Asculus genus of the Soapwort order, or Sapindaces. Escalus Hippocastanum, the common horse-chestnut, is the typical species. This is a remarkably handsome and very useful tree. Its timber is used for turnery and fuel, and its seeds have long been employed in Switzerland for feeding sheep. Its bark, which contains a peculiar principle called Escalin, is febrifugal, and is occasionally used in medicine, while its young leaves are somewhat aromatic, and have been substituted for home. In France large quantities of starch are obtained hops. In France, large quantities of starch are obtained from the seeds, which, in England, are considered worthless. A peculiar oil, which is said to be a wonderful remedy for rheumatism, is also extracted from these seeds. The roots and leaves of the American

these seeds. The roots and leaves of the American borse-chestunt, or buck-eye, are considered poisonous.

\*\*Estratics, ees-thet\*-iks (Gr. aisthetikos, perceptible to the senses), the science of the Beautiful in Art. The word was first employed about the middle of the 18th century by Alexander Baumgarten, a follower of Christian Wolf, and professor of philosophy in the university of Frankfort on the Joder; and, having leave found both convendencing and daintie it was been found both comprehensive and definite, it was generally adopted by the French and English art-writers. According to the theories of the soundest writers. According to the theories of the soundest psychologists, human nature may be divided into the capacities of knowing, acting, and feeling; in other words, into intellect, will, and sensibility. To these capacities correspond respectively the ideas of the True, the Good, and the Beautiful. That which logic is words, into intellect, will, and sensibility. To these capacities correspond respectively the ideas of the True, the Good, and the Beautiful. That which logic is to intellect, ethics to will, is esthetics to sensibility. The laws of thinking are determined by logic, the laws of acting by ethics, and the laws of feeling by sethetics. As the ultimate aim of thought is truth, as the ultimate aim of action is good, so is beauty the ultimate aim of setion is good, so is beauty the ultimate aim of action is good, so is beauty the ultimate aim of setion is good, so is beauty the ultimate aim of action is good, so is beauty the ultimate aim of favore and leave and Plato downward, have endeavoured to place the laws of taste upon a definite basis, like those of ethics and logic. To fully explain and discuss the respective systems of exthetics would require a volume; it will be sufficient here to indicate the two principal modes of treating exthetics as a science. Those philosophers who have employed the à priori method have sought to analyze the usthetic notions proper to the mind, and to erect upon a definite basis, like those of ethics and logic. To fully explain and discuss the respective systems of exthetics would require a volume; it will be sufficient here to indicate the two principal modes of treating exthetics as a science. Those philosophers who have employed the à priori method have sought to analyze the usthetic notions proper to the mind; of a priory. An action for ibel will not lie for any defamicary statement contained in it, put the person of eachige to the offensive mater. By the 6 & 0 Will. IV. c. 62, in all extraidensatory statement contained in it, put the person and it is put the person defamically statement contained in it, put the person of the person and it is put the offensive mater. priori method, and in the a posteriori, Aristotle leinae, Lessing, Winokelmann, Bayle, Roussess, and à priori method, and in the à posterieri, Arithèlie, Heinze, Lessing, Winckelmann, Bayle, Roussein, and the greater portion of the Italian, Franch, and English writers upon the laws of taste. In England, however, the aim of the various philosophical speculators has been to discover, not the idea of the Beantiful, like the Germana, but the Beautiful itaelf.— Eef. Jouffroy's Cours d'Esthétique; Cousin's Le Vrai, le Beaut, et le Bon; Schiller's Treatise on Absthetics; Burke's Treatise on the Subleme and He Beautyful; Alison's Essays with Nature and Frinciple of Taste.

Abstruction, ses-in-vai-shan, in Bot., a term signifying the summer state, is applied to the general arrangement of the different parts of the flower. When, those parts are placed in a circle, and in nearly the same plane,

parts are placed in a circle, and in nearly the same plane, the sestivation is said to be circular, and when they are placed at slightly different levels, so as to overlap, each other, it is said to be piral. The term prafferation is used by some botanists instead of assivation.

ESTUARY. (See ESTUARY.) ÆTHER. (See ETHER.)

ETHER. (See ETHER.)

ETHURA, e-thu-sa, in Bot., a genus of umbelliferous plants. Ethusa Cynapium, fool's paraley, is a common indigenous plant, highly poisonous, which has been frequently mistaken for paraley.

ETTOLOGY, e'-ti-ol'-o-je (Gr. atita, a cause, and logos, discourse), in Rhet., a figure of speech, by which the causes of an event are developed in the narrative.

ETOBATES, e-to-bai'-tees, a genus of fossil fishes allied to the Rays, the species of which are found at Sheppey, in the London clay.

AFFA, df-fa, a weight in common use on the Gold Coast of Guinea, the half of which is called eggeba. They equal the English ounce and half-ounce. The negroes on the Gold Coast invariably give these names to these weights.

Affale, af fair', any action or engagement not of sufficient magnitude to be termed a battle.

AFFECTED, Or ADFECTED EQUATIONS, in Alg., are those in which the unknown quantity is found in two or

more different powers; for example,  $x^2 - px^2 + qxx + x^2b$ ; in which are three different powers of x.

AFFETTOOS, of-fet-too-o-zo, asign in Music, by which is intimated that the part to which it is applied must be played in a tender, moving manner, and rather

slow than fast

AFFICHE, af'-feezh (Fr. affiche), a word generally used by the French to describe posting-bills, or any adver-tisements, large or small, either posted upon walls or distributed by hand, to make anything known to the

AFFIDAVIT, of f-f-dai'-vit (Lat. affido, I pledge faith to), in Law, is a statement, in writing, of facts for the information of a court in a cause or matter pending, or about to be commenced therein; or to comply with particular statutes relating to the revenue and otherwise. Unless it be used in a cause or matter in court, or be made before the Commissioners of Inland Revenue, or exempted by statute, it must bear a stamp of 2s. 6d. Any person making a wilfully false statement in it, material to the question or subject which it is intended to support or disprove, is liable to be indicted for perjury. An action for libel will not lie for any defamatory statement contained in it; but the person made subject to the defamation may apply to the court to refor it to its officer to strike out the offserive or be made before the Commissioners of Inland Reve

or delivered of a bastard child, may, either before the birth, or at any time within twelve months from the birth, make application to a magistrate, charging a person by name as the father of her child; and, where the alleged father has within twelve months paid money for its maintenance, such application may be made at any subsequent period. The magistrate, on the evi-dence of the mother, corroborated in some material markinglar by other testimony to his artifaction. particular by other testimony to his satisfaction, may make an order on the putative father for payment of costs, and of a weekly sum not exceeding 5s. per week for the first six weeks from the birth, and afterwards not exceeding 2s. &d. per week, for the maintenance of the child; 10s. for midwife, and 10s. for funeral ex-penses, if the child die before making the order. The erder will remain in force until the child attain the age of thirteen, or die, or the mother be married. If the mother allow the payments to remain in arrear for more than thirteen weeks, she cannot recover them for a longer period. The party charged may appeal from the order to the court of Quarter Sessions, upon such cotter to the court of quarter Sessions, upon entering into a recognizance to try the appeal and pay such costs as may be adjudged. In default of payment of the moneys provided for by the order, the putative father may have his goods distrained upon, or, if he have none, be committed to prison, and so from time to time. (See BASTAED.)

ATELITY, of find-i-te (Lat. of, for ad, to, and finis, a boundary or limit), in Law, is relationship by marriage, as consenguinity is by blood. Within the prohibited degrees, no person may marry. (See MARRIAGE.)

as consequency is by blood. Within the prohibited degrees, no person may marry. (See Marriage.)
Appinity, or Chemical Attraction, is the force which causes the particles of dissimilar kinds of matter to combine together, so as to form new matter. This definition indicates the differences between affinity and cohesion, which is another modification of molecular attraction. Cohesion merely binds similar particles into a mass; affinity brings about the combination of heterogeneous particles, and causes them to lose their individual properties. The change of characters which follows the action of affinity is or characters when issues the action is almost any very wonderful;—for example, the inflammable metal sodium unites with the sufficienting gas chlorine, and the compound thus produced is chloride of sodium, or common salt, a substance which does not bear the slightest mon sait, a substance which does not bear the slightest resemblance to either of its components. Chemical combinations do not take place indifferently, but in accordance with certain strict rules or laws. One substance will unite with another in preference to a third, or in some cases in preference to any other. This preference is denoted by the term elective affinity. By means of this discriminating action of affinity, some combinations may be decomposed. If for intractions means or this discriminating action of aminity, some combinations may be decomposed. If, for instance, there be a substance (X) composed of two elementary bodies (A and B) which have a slighter affinity for each other than one of them (A) has for a third element (O), then, if we bring this third body into connection with them under the requisite conditions, the one (A) which has the greatest affinity for it will leave one (A) which may the greatest attnive for it will leave the other (B), and unite with it to form another com-pound (Y). The decomposition of water by red-hot iron illustrates such a case; for if water, which is composed of the elements oxygen and hydrogen, be passed through a tube containing iron flings heated to redness, its oxygen will unite with the iron to form a kind of rust, and its hydrogen will be set free. In every kind of rust, and its hydrogen will be set free. In every case where one constituent is expelled by a new body, and thus liberated, the decomposition is said to be the result of single elective affinity; but, when two substances, each consisting of two constituents, act reciprocally upon each other so as to produce two new compounds, the decomposition is referred to duable cleative affinity. This double reaction takes place when a chloride of phosphorus is thrown into water; the chlorine leaves the phosphorus, and unites with the hydrogen of the water to form hydrochloric acid, while the remaining elements, phosphorus and oxygen, enter hydrogen of the water to form hydrochloric and, while the remaining elements, phosphorus and oxygen, enter into combination and produce phosphoric acid. An idea formerly prevailed, that the affinity between any two substances never varied, and great labour was bestowed on the preparation of tables exhibiting the precedence of affinities. Modern chemists, however, do not regard affinity as a fixed and regular force, and the tables alluded to are now considered useless. The attraction of one body for another is greatly modified

by the circumstances under which the two bodies are brought together. Alteration of temperature is one of the causes which influence the force of chemical of the causes which influence the force of chemical attraction. When metallic mercury is heated nearly to its boiling paint, and exposed in this condition to the air for a lengthened period, it absorbs oxygen, and becomes converted into a dark red crystalline powder. But this same oxide of mercury, when raised to a still higher temperature, parts with its oxygen, which leaves the mercury in its original metallic state. Insulubility and the power of vaporization are notent disturbility the mercury in its original metallic state. Insolubility and the power of vaporization are potent disturbing influences; they interfere in almost every reaction, and frequently turn the scale when the opposing affinities are nicely balanced. Thus, when a solution of lime in hydrochloric acid is mixed with a solution of carbonate of ammonia, a double reaction ensuese carbonate of lime and chloride of ammonium being generated. This result is brought about mainly by the insolubility of the carbonate of lime. Again, a mixture of dry carbonate of lime and chloride of ammonium. of dry carbonate of lime and chloride of ammonium, when heated in a retort, gives a sublimate of carbonate of ammonia, while chloride of lime remains behind. In this instance, the great volatility of the new ammoniacal salt determines the nature of the decomposition. What is called the nascent state is one very favourable to chemical combination. Thus, carbon and nitrogen to chemical combination. Thus, caroon and mirrogen refuse to combine with hydrogen under ordinary circumstances; but, when these gases are associt or newly evolved, as when they are simultaneously liberated from some previous combination, they unite readily. Some remarkable decompositions are referred to a peculiar modification of chemical force, to which the term disposing affinity has been applied. The prepa-ration of hydrogen from zinc affords a familiar example of such decompositions. A piece of polished zinc put into pure water remains perfectly bright for any length of pure water remains perfectly bright for any length of time, and manifests no power of decomposing the liquid. On the addition, however, of a little sulphuric acid, the metal becomes oxidized, and hydrogen is freely disen-aged. The acid dissolves the oxide as fast as it is produced, and thus keeps the surface of the metal exposed to the action of the water. This function of the acid is perfectly intelligible; but its disposing influence, under which the oxide is first formed, is not well understood. Affinity is generally much stronger between bodies which are very unite ench other, than between bodies which are very units each other, than between bodies which are very units each other, than between bodies which are closely allied. Thus, potassium and sodium tend strongly to units with chlorine and iodium, but the bodies of each pair do not attract one another with sufficient force to enter into combione mouner with sumercut force to enter into combination. The discoveries of Faraday and others have established the fact, that whenever two substances unite to form a compound, they are in opposite electrical conditions; one being electro-negative, and the triest conducing; the neing electro-negative, and the other electro-positive. This and other facts go to prove that chemical affinity is a particular modification of electrical attraction. (See ElectroCutsus). The word "affinity" appears to have been employed for the first time by Barkhausen, a German chemist, in his "Flements of Chemistry," published at Leyden in 1703. ments of Chemistry," published at Leyden in 1703. The elder Geoffrey issued the first table of affinities

The elder Geoffrey issued the first table of affinities fifteen years later; and more extensive tables were afterwards compiled by Wenzel, Bergmann, Guyton-Morveau, and other chemists of the last century.

AffirmAtion, Affirmation, the last century.

AffirmAtion, The main and Lat. affirmatio, from firmo, I support), in Law, signifies the ratifying or confirming a former law or judgment. Thus we say, the House of Lords, on an appeal, affirmed a decree of the lord-chancellor, or of the Court of Session, and the lord-chancellor, or of the Court of Session, and the lord-chancellor, or of the Jords justices, affirmed the of the forti-enancellor, or of the Court of Session, and the lord-chancellor, or the lords justices, affirmed the decree or order of a vice-chancellor, &c. It is also a solemn form of attesting the truth allowed to be used by the Friends or Quakers, instead of an oath, which they hold absolutely unlawful to take. AFFIRMATION, in Gram, a term applied to such particles as affirm or assert, in opposition to such as

deny a statement.

AFFIRMATIVE QUANTITY, in Alg., signifies a quantity to be added, in contradistinction to one that is to be taken away.

AFFIRMATIVE SIGH, or POSITIVE SIGH, in Alg., the sign of addition, marked +, meaning plue, or more. The early writers on algebra used the Latin word plue, or the Italian più, to signify addition, and afterwards the letter p, as an initial or abbreviation.

## Affix

AFFIX, df-fix (Lat. af, for ad, to, and figo, I fix), in Gram., a term applied to a syllable added to the end of a word, by which its form and signification are altered; as, wealth, wealth-y; odd, odd-by.
AFFLATUS, df-fixi-bus (Lat., in a ffigurative sense, inspiration, enthusiasm), a term which, among the

AFFRONTÉ.

ancients, denoted the supposed inspiration of particular persons, such as poets.

APPRONTE, af-fronte (Lat. af, for ad, to, and from, face). In Her., a term applied to animals facing each other on an escutcheon.

AFORE, a-for (Ang.-Sax.) in Mar., denotes that part of the vessel which lies forward, or adjacent to the stem

A FORTIORI, for-ti-o'-re in Log., is a term employed in a chain of reasoning, to denote that what follows is a more powerful argument than that which has already been addaced.

AFRICAM ASSOCIATION, a Society formed in London, in 1788, for the purpose of offering encouragement to

travellers and scientific men to explore the interior of Africa, to introduce the arts of civilization among the natives, and to study their character and habits. first person thus commissioned was Mr. John Ledyard, arss person unus commissioned was Mr. John Ledyard, who died at Cairo, while preparing for his journey, in 1758. His successor was Mr. Lucas, who, in his turn, was succeeded by Major Houghton, who died, it was said, a violent death, in September, 1791. The celebrated Mungo Park was the next person engaged by the association. Two Germaus, named respectively Horneman and Roeutzen, were subsequently sent out; the association. and the last missionary was John Louis Burckhardt, who died at Cairo in 1817. During the period of the active labours of the association, a large amount of information connected with the resources and geography of Africa was collected. In 1831 the association was incorporated with the Royal Geographical

APRICAN COMPANY, in Com., a society of merchants abilities of the reign of Charles II., for trading to Africa, and incorporated by the act 23 Geo. II. c. 31, 1754. When the expenses of the company had to be defrayed out of the public purse, its charter was recalled by parliament (1 & 2 Geo. IV. c. 28, 1821), and the possessions of the company were annexed to

APRICAT TRAM, the timber of the Oldfieldia africana, the handle have the Alberta Tram, the timber of the Oldfieldia africana, the handle handl

a tree belonging to the natural order Euphorbiacea. It is exceedingly strong and durable.

AFT. (See MART.)
AFTED DAME, of the damp, the familiar term for the sufficient gas, consisting chiefly of carbonic acid, which remains in a coal-mine after an explosion of

"fire-damp." (See FIRE-DAMP.)

AFTERMATH, iff-ter-math, in Agr., the grass which grows after the hay has been mowed and made. It is grows after the hay has been mowed and made. It is also called rowen, rowett, latter-math, and, when left long upon the land, fogg. When made into hay, it is inferior to the first crop, and is considered less injurious to sheep or cows than to horses.

AGA, or AGEA, a'-ga, a title borne among the Turks by military commanders; also by the superior officers of the seraglio.

of the seragio.

AGALMATOLITS, a-gall-ma-to-lite (Gr. agalma, statue, lithos, stone), in Min., a white, translucid, waxy-looking mineral, commonly known as figure-stone, brought from China, carved into little grotesque figures. It is usually delicately tinted with pink, grey, yellow, or green, and can be easily out and modelled with a sharp instrument. It resembles coapstone, but it may be distinguished from that mineral by the ways of magazin. St it consists anothy of sillon with the ways of magazin. by the want of magnesia, as it consists solely of silica and alumina, with a little carbonate of lime and potash.

## Agaricus

AGAMI, or GOLD-BREASTED TRUMPFERS, o-ga'-me, Peophia crepitane. A bird about the size of a phesessat or large fewl, with long neck and legs, but a short tail. It is found in numerous flocks in South America; can run swiftly, and, when pursued, trusts less to its wings than to its legs. In its domesticated state, the again is so fond, faithful, and jealous, that it will attack the dogs and other snimals who venture near its master to share his careses.

share his caresses.

AGAMA, or AGAMDE, a-gal-ma, a fam. of Samrian reptiles. Charac. Short, broad, flat heads, and thick depressed bodies, enveloped in a loose skin, which is capable of being distended with air at the will of the animal. Different species of Agamids are found in Asia, Africa, Australia, and America. Some species can change the colours of their skin, which causes the natives of South America to call them chameleons. natives of South America to call them chameleous. They are of diminutive size, and generally lurk among rocks, heaps of stones, and mouldering ruins. Some of the more active kinds, however, climb tress, play among the branches, and feed upon insects and other small animals. One tribe, found in India, is said to be herbivorous. The Frilled Agams, a native of Australia, is a very extraordinary looking saimal. Around its neck, and covering its shoulders, it carries a frill which, on the approach of dancer, is elevated. a frill, which, on the approach of danger, is elevated.

a frill, which, on the approach of danger, is elevated.

AGANOUS, äg'-ä-mous (Gr.), is a term used by some writers instead of cryptogamic. It is principally confined to Confervæ, lichens, fangi, and similar groups. They are said to have no functions analogous to sexes.

AGAPR, äg'-ä-pe (Gr. love), in Eocl. Hist., the love-feast or feast of charity, practised among the primitive Christians, at which time a liberal contribution was made by the rich to feed the poor. St. Chrysostom derives this feast from the apostolical practice. He says, the first Christians had all things in common, as we read in the Acts of the Apostles; but when that equality of possession ceased, as it did even in the apostles' time, the agape or love-feast was substituted for it. Upon certain days, after partaking of the Lord's Supper, they met at a common feast, the rich bringing provisions, and the poor, who had nothing, being invited. During the first three centuries these feasts were held without scandal; but later the heathens were held without scandal; but later the heathens began to tax them with impurity. The kiss of charity, which used to terminate the ceremony, was forbidden. In consequence of the abuses which had arisen, these feasts were abolished by the Council of Carthage, in the year 397.

AGAPARTRUS, ag-a-pan'-thus (Gr. agape, love, anthos, flower), in Bot., plants belonging to a genue of the natural ord. Liliacea. The typical species is Aga-

natural ord. Liliacez. The typical species is Agapanthus umbellatus, the African blue lily, a native of
the Cape of Good Hope, whence it was brought to
Holland, and, in 1693, it was cultivated at Hampton
Court. It is now a favourite garden-plant. It grows
nearly a yard high, and, in July, bears a handsome
bunch of blue flowers, which have no seent.
AGAPERONE, ig-e-pem-o-ne (Gr. agape, love, and
mone, abode), the abode of love or charity, the name
of an institution at Charlinch, near Taunton, founded
in 1846, by Henry James Prince, formerly a clergyman of the church of England. Mr. Prince succeded in inducing several ladies of fortune to adopt
his views, three of whom were afterwards married to
three of his disciples. In 1850 there were between 50. three of his disciples. In 1850 there were between 50 urree of ms disciples. In 1850 there were between 50 and 60 persons, male and female, living in community at this establishment. One of their leading tenets is community of goods, and they evidently have a goodly share of the good things of this life. The public have obtained occasional glumpess into the internal management of this "abode of love," in consequence of legal proceedings that have on several occasions been adopted against it.

AGAPTER, & donore-lee (Gr. anane. love). in Ecc. Hist.

AGREER, d-ga-pe'-lee (Gr. agape, love), in Ecc. Hist., was a name given to certain virgins and widows in the ancient church, who associated themselves with, and attended on, ecclesiastics out of motives of piety and benevolence. The scandal which this gave rise to

benevolence. The scandal which this gave rise to against the Church led to its suppression.

AGAR-AGAR, dy'-ar-dy'-ar, a name sometimes given to the alga commonly known as Ceylon moss, used for making jellies. (See GRACHABLA.)

AGARICUS, a-gdr-i-kus (Gr. agarikon, a fungus), in Bot., the mushroom, a genus of fungi, characterized by

the pileus, or cap, being distinct from the stalk, and having, on the under side, numerous flakes or gills radiating from the centre. The genus comprehends an immense number of species, many of which are edible. These fungi grow in wet and shady places in fields and woods, and on hotbeds prepared for their cultivation. The species of Agaricus commonly estern in this country are Agaricus commonly estern in this country. The species of Agericus commonly esten in this country are Agericus compestris, the common mushroom, and several cultivated varieties of the same; A. arcensis, A. Georgii, and A. oreades. The last is the Champignon, which is highly esteemed for its savoury qualities. Many genera of fingi allied to the one under consideration include edible species, which are extensively used for food in this and other parts of the world. Dr. Badham enumerates no less than thirty fungi, natives of Britain, which are eaten by himself and his friends; and complains of the prejudice existing against several species which might form dainty and nutritious articles of food. However this may be, fatal cases of noisoning of food. However this may be, fatal cases of noisoning of food. However this may be, fatal cases of poisoning by fungi are not uncommon, and great care should be taken to ascertain whether a fungus is or is not poison-ous, before introducing it into the market as a wholesome vegetable. There are no certain characters by which the edible and poisonous species may always be distinguished; but there are some general characters which help us to separate the two groups. Professor Bentley has tabulated these general characters as follows:—

Edible Mushrooms.

Grow solitary, in dry airy places.
 Generally white or brownish.

3. Have a compact brittle flesh,

4. Do not change colour, when cut, by the action of the air.

5. Juice watery.
6. Odour agreeable.
7. Taste not bitter, acrid, salt, or astringent.

Poisonous Mushrooms.

1. Grow in clusters, in woods and dark damp places.

2. Usually with bright colours.

3. Flesh tough, soft, and water

Acquire a brown, green, or blue tint, when cut and exposed to the air.

5. Juice often milky.

Odour commonly powerful and disagreeable.
 Have an acrid, astringent, acid, salt, or bitter

Professor Bentley suggests that we should avoid all fungi which insects will not touch, and those which have scales or spots on their surface; and, further, that whatever may be the apparent qualities of the fungi, we should use with caution all which have arrived at their full development, or when they exhibit have a processing doubtful fungi out ampin, we should use with caution all which have arrived at their full development, or when they exhibit any signs of change. By soaking doubtful fingi, cut into slices, for about an hour in vinegar, and afterwards washing them in boiling water, we get rid of any poisonous principles they may possess, and the process will not spoil them for the table. The edible fungi not included in this genus, such as the morel and the truffle, and also the most poisonous fungi, are described under the names of the genera to which they belong the truffle, and also the most poisonous fungi, are described under the names of the genera to which they belong the truffle, and also the most poisonous fungi, are described under the names of the genera to which they belong the truffle, and sport of the subterranean mycelium or spawn of some agaries develops in a radiating manner, give rise to the circles of luxuriant grass which country, give rise to the circles of luxuriant grass which country folks designate "fairy rings." Certain members of this great family give out a sort of phosphorescent light. The so-called aparies used for making German tinder, and other kinds of amudou which are employed in surgery, are now regarded as species of a distinct genus. (See POLYPOURS.)—Ref. Bentley's Manual of Botany.

Agara, dg-at (Gr. achates), in Min., a semi-pellucid, variegated, and uncrystallized variety of quartz, named after Achates.

AGATS, dg'-dt (Gr. achates), in Min., a semi-pellucid, rariegated, and uncrystallized variety of quartz, named after Achates, a river in Sicily, whence the Greeks are said to have first procured it. Chemically, it consists almost entirely of silica, coloured by metallic oxides. The colours of agate are generally arranged in parallel or concentric bands, but sometimes form spots, clouds, and moss-like stains. These colours are possessed by billing the stone in oil, and afterwards in suphuric acid, and by other ingenious but fraudulent processes which have been fiftieth year; when the power of procreation usually and afterwards in suphuric acid, and by other ingenious but fraudulent processes which have been fiftieth year; the sixth period extends to the seventh or eighth year, when the soom dentition is commonly over; the third extends to the ago of puberty, which varies in different the second dentition is commonly over; the third extends to the ago of puberty, which varies in different the second dentition is commonly over; the third extends to the ago of puberty, which varies in different the second dentition is commonly over; the third extends to the ago of puberty, which varies in different the second dentition is commonly over; the third extends to the ago of puberty, which varies in different the second dentition is commonly over; the third extends to the end of the seventh or eighth year, when the second dentition is commonly over; the third extends to the ago of puberty, which varies in different extends to the end of the second dentition is commonly over; the third extends to the end of the seventh or eighth year, when the second dentition is commonly over; the third extends to the end of the seventh or eighth year, when the second dentition is commonly over; the third extends to the end of the second dentition is commonly over; the third extends to the end of plustry, which varies in different extends to the end of plustry, which varies in different extends to the end of plustry.

devised by the lapidary. Agates occur, in nature as rounded pebbles, and are brought into this country from Oberstein, in Saxony, from Arabia, and India; some varieties, however, are found in Perthabire and other parts of Socialand. The Socioth pebble, or fortification agate, so called from its zigzag pattern, is one of these varieties. Agates take a high polish, and their besutiful colours adapt them for many ornamental purposes. They are cut into brooches, seals, bracelets, and similar objects, and are largely employed for mossic work. In the useful arts, agates are employed for mossic work. In the useful arts, agates are employed for mossic work, when sufficiently large, they are made into mortars for chemical purposes. The moss agate, or Mocha-atone, is curiously marked with figures resembling growing tutts of moss. These markings were, until quite recently, supposed to be produced by vegetable structures imbedded in the stone; but Professor Göppert has proved that they are merely deposits of oxide of iron.

Agathod mon, id-a-tho-de-mon (Gr. agathos, good,

are merely deposits of oxide of iron.

AGATHODEMON, dg-a-tho-de'-mon (Gr. agathos, good, and daimon, a spirit). (See DEMON.)

AGATHOPHYLLUM, dg'-a-tho-fle'-mon (Gr. agathos, good, and daimon, a spirit). (See DEMON.)

AGATHOPHYLLUM, dg'-a-tho-fle'-lum, in Bot., a genus of plants in the natural order Lauracee. The species A. aromaticum yields the Ravensara nut, or clove nutmeg of Madagascar; used as a spice.

AGATE, d-gaiv' (Gr. agauos, admirable), in Bot., a genus of monocotyledonous plants of the Amaryllis order, or Amaryllidacee. The typical species is Agare americana, the American aloe or maguey. This plant is cultivated by the Mexicans, who obtain from it a favourite drink, called pulque, octli, or agave wine. The plant is of slow growth; but when fully developed, its leaves, which spring directly from the ground, attain a height of from five to sight feet. From the midst of the great cluster of leaves a flower-atem arises, and from this numerous flower-bearing branches spring, so that the whole plant has somewhat the spring, so that the whole plant has somewhat the appearance of a candelabrum. It was formerly erroappearance of a cancelarum. It was formerly erroneously supposed that the agave lived a hundred years
before flowering; hence it was frequently called the
hundred years plant. It really flowers only once in
about ten years, and the planter has to wait patiently
for the flowering season to obtain a supply of pulque,
as this liquor is formed from the juice contained in the
young flower-stalk. As soon as this organ makes its
appearance the planter packet deep ref. in it. young hower-stank. As soon as this organ makes its appearance, the planter makes a deep cut in it, and socops out the whole heart or middle part, leaving nothing but the outside rind. A natural basin, about two feet in depth, is thus formed, and into this basin, the sap which was intended to feed the shoot flows so rapidly, that it is necessary to remove it twice, and rapidly, that it is necessary to remove it twice, and sometimes these times a day. To make this more easy, the leaves on one side of the basin are cut away. This sap, before it is fermented, has a very sweet taste, and is called aquamiel, or honey-water. It ferments spontaneously, and forms the pulque, which is a refreshing, slightly-intoxicating drink, which has a pleasant acid taste, but a very disagreeable odour. From pulque an ardent spirit is distilled, which is known by the name of mexical, or, less commonly. known by the name of mexical, or, less commonly, aguardients de maguey. From the leaves of this and

aguardiente de maguey. From the leaves of this and other species of the agave genus, the useful fibre called aloc-fibre, pita, or pité hemp, is obtained.

Acs. ai; (Fr. aga), in Physiol. During the progress of life from infancy to manhood, and from manhood to old age, the body undergoes certain marked changes, which distinguish the different periods or stages of life. These are usually denominated ages, and are properly seven in number, though some make them fewer. They are—1. Infancy; 2. chiddhood; 3. boyhood or girlhood; 4. adolescence; 5. manhood or womanhood; 6. age; 7. old age. The first age commences at birth, and extends to the end of the second year, by which time the first dentition is generally completed; the second extends to the end of the seventh or eighth year, when the second dentition is commonly over; the third extends to the end of puberty, which waries in different extends to the ege of puberty, which waries in different extens to the end of the seventh or eigner year, man-the second dentition is commonly over; the third extends to the age of puberty, which varies in different countries, but with us is from twelve to fourteen in the female, and from fourteen to sixteen in the male; the fourth extends to about the twentieth year in the female and the twenty-fourth in the male; the fifth

third year, when the seventh and last period of life

third year, when the seventh and leav period of life commences.

Acts, in Law, is that time when persons are enabled to do what for want of years they are prohibited doing, or to become responsible for their acts. The age of legal capacity is twenty-one; but it arrives for some purposes much earlier. In orininal cases a person of the age of fourteen years may be capitally punished for any capital offence, but not under the age of seven. At twelve a male may take the oath of allegiance; at fourteen he is at years of discretion, and may enterinto a binding marriage, or consent or disagree to one contracted before, or choose a guardian. A female at twelve is at maturity for those purposes. An infant above fourteen is liable to suffer for a breach of the perice, inct, battery, or the like, and for perjury or chebting. A tenant of gavelkind lands, in parts of Kent, is of sufficient age to aliene his eatste by feoffment at the age of fifteen. The law presumes a child at fourteen to be a competent winess; but if under that age, if it be aware of the nature of an oath, its evidence will be received. No one under twenty-one can serve as a member of parliament, be ordained a priest, or be admitted to practise as an attorney, solican serve as a member of parlament, be organized a priest, or be admitted to practical as an attorney, soli-citor, proctor, or notary public. A bishop cannot be consecrated before thirty. A contract of an infant may be ratified on attaining the age of twenty-one. Full age in male or female is twenty-one years, which age is completed on the day preceding the anniversary of a person's birth, who, till that time, is an infant, and so styled in law.—Ref. 1 Co. Litt. 78; 1 Bl. Com. 462. (See INFANTS.)

-It has been stated that the dura-AGE OF ANTICALS. tion of an animal's life is generally seven or eight times longer than the period it takes to arrive at its full growth, a rule that applies moderately well to domestic animals, such as dogs, horses, sheep, ozen, and even elephants and camels, but is not applicable to man, or to the majority of quadrupeds, fishes, birds, or reptiles. The age of the horse may be calculated by an examination of the incisive teeth or nippers; but at ten years old these marks are lost, and no accurate calcula-tion can be arrived at. Deer shed their horns every year, and, in the males of some species, each year adds a branch to the horns, until a certain size is attained. In sheep, oxen, antelopes, and goats, a ring is annually added to the base of the horn up to a certain age. There are no certain indications by which the durat There are no certain indicatons by which the cutaton of life of birds, fishes, and reptiles can be ascertained. The Indians assert that the clephant lives 300 years, Dogs live from 12 to 14 years, sheep 8 or 9, oxen about 20, horses, if well treated, from 25 to 30, camels from 40 to 50. Eagles have lived more than a century, and many instances are recorded of raveys having exceeded that period. Swans, also, have been known to live 100 years, parrots 60 and 80; pheasants and domestic poultry seldom reach more than 12 or 15 years. Among that, the carp has been known to live 200 years. A more trout have been confined in a well for 30 and 50 years. A pike has been known to exist in a pond 90 years. A story is related of one caught in a lake near Hallerm, in Susbia, which had attained the age of 267 years. Of reptiles, the torteles is said to be the longest lived; but this may be doubtful, as nothing is known of the duration of life of the various tribes of serpents. Of the ages of insects but little is known. The life of the caterpillar orgrub, in its first period, extends to several months; but after the attainment of their perfect form, they live but a few days or weeks. As a general law of many instances are recorded of raveys having exceeded they live but a few days or weeks. As a general law of nature, early maturity indicates shortness of life. Aca or term Moora, a term signifying the number of days chapsed since the last new moon.

number of someontric rings, each of which, in exogenous trees, marks a year's growth. The oriental plane, the bashab, and the chestaut, are calculated to live during several thousand years. Yews, in some cases, are calculated to be flourishing at the age of from 1,500 to 2,000 years. Oaks are reputed to attain, under favourable conditions, the age of 1,200 years. On Mount Eins there are three famous awest-chestant trees, which measure reproducts 150 fact 20 four Mount Eins there are three famous sweet-chestnut trees, which measure respectively 180 feet, 70 feet, and 64 feet in discountiarance, and are and to be as old as 5,000 years. In the valley of Boynkdere, near Constantinople, there is an oriental plane-tree measuring 180 feet in circumference, which is held to be at least 5,000 years old. Upon the Mount of Olives, at Jerualem, there are eight olive-trees, which were flourishing when the Turks took Jerusslem, 800 years since. At Fountains abbey, in Torkshire, there grows a yew-tree which is reported to have attained a green old age when the abbey was built, viz., in the year 1132. Near Staines there is a yew-tree older than the meeting of the English barons at Runnymede, in 1215, the date of the signature of Magna Charts. Wallace's oak, at Ellersley, near Paisley, in Scotland, is held to be upwards of 700 years old, and it is still flourishing. The following is a list of the ages to which certain trees may attain may attain :

Palm, 200—300 years. Elm, 355. Cypress, 388. Ivy, 449. Maple, 516. Larch, 263—578. Chestnut, 360—626. Oranges, Lemona, &c., 400, 509, 640. Plane, 720. Cedar, 200-800. Walnut, 900. Walnut, 900.
Lims, 364, 530, 800, 825, 1,076.
Spruce, 1,270.
Oak, 600, 800, 880, 1,000, 1,600.
Olive, 700, 1,000, 2,000.
Yew, 1,214, 1,466, 2,588, 2,880.
Baobab, 6,000.
Dragon-tree, 6,000.
GEMOGLANS, a-jew-o-gläns, s

AGENGLINS, a -jem-o-gläns, a term applied to those children of the Christians who were taken by the Turks at the end of efery three years by way of tribute. These children were instructed in the Mahome-

bute. These children were instructed in the manufacture religion, and trained to be janizaries.

AGENDA, ai-fen'-da (Lat., things to be done), a term applied in the Roman Catholic church to certain for example,—Agenda matutina omces or services, as, for example, " years managed to the perfiting, morning and evening prayers; Agenda dies, the office of the day; Agenda mortuorum, the service for the dead, &c. Agenda was likewise applied to the volume containing the risual or church service of the Romish church.

AORNA, in Com., a term signifying a pocket or memorandim-book, in which a merchant sets down what is to be done during the day. The name has likewise been given to a pocket almanso.

linewise been given to a pooter aimana.

Agrantiza, "j-j-a-line (Ang. Sar.), in the old writers, signified a guest who had ledged at the same inn for three consecutive nights, after which time he was considered one of the family, and the host became answerable for him if he committed any offences

against the king's peace.

Agans, as in other matters, is one who conducts the affairs, or is intrusted with the commission of another. AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

AGE OF THE MOON, a term signifying the number of days chapted since the last new moon.

He may be constituted either by express appointment or by implication of law, arising from the circumstances in which the commission of another. He may be constituted either by express appointment or by implication of law, arising from the circumstances in which the commission of another. He may be constituted either by express appointment or by implication of law, arising from the circumstances in which the commission of another. He may be constituted either by express appointment or by implication of law, arising from the circumstances in which the commission of another. He may be constituted either by express appointment or by implication of law, arising from the circumstances in which the commission of another. He may be constituted either by express appointment or by implication of law, arising from the circumstances in which the commission of another. He may be constituted either by express appointment must be in writing:

To grant a lesse of land for above three years AGENT, in Dip., a general term applied to several ranks, as envoys extraordinary, and ministors planipo-tentiary, ambassadors, ministors resident, charges d'affaires, secretaries of legation, &c. In ordinary language, the principal representative of one power at the nourt of another is termed the agent of that power at that particular court.

the wonth of another is techned the seast of that power at that particular court.

Agan, at ger (Lat., a field), a term in use among the ancient Romans to signify a portion of hand shotted to each citizen. The writers of the Middle Ages employed the word ager to denote an acre of land.

Agas of the Word.—By the Greek and Roman poets the history of the world was divided into four periods or ages, which they termed the Golden, Silver, Brazen, and Iron ages. In the first, or golden age, Saturn reigned in heaven, the earth yielded her fruits apout anought, and men lived in a state of perfect innocence and happiness. When faturn was expelled from heaven, the silver age commenced; men then began to theviate from the paths of virtue, and, in consequence, their lives were less happy. The brazen age was marked by a still further deviation from virtue, and was succeeded by the iron age, which now exists, when the stubborn earth demands cultivation, and sin and misery prevail. The history of the world is sometimes divided into three great epochs, or ages;—1. The age of the law of nature, from Adam to Moses; 2, the age of the Jewish law, from Moses to Christ; and 3, the age of grace, from Christ to the present time. Agglutinantiantial and the continuation of agercal applications as tend to unite parts which have too little adhesion.

Aggregate Frutte, age grace, from Bot., fruits formed by the combination of agercal dowers, as the pineapole by the combination of agercal dowers, as the pineapole

AGEBEATE FRUITS, & g. gre-gail, in Bot., fruits formed by the combination of several flowers, as the pineapple and the nulberry. The term anthocarpane is more generally used. Some botanists apply the term aggregenerally used. Some botanists apply the term aggregate to a compound fruit, consisting of numerous achienis, borne by a single flower; as the fruit of the ranunculus or the raspberry.

AGIO, \$\frac{\psi}{2} \dots \dots\$ (com, a term used to express the difference between the value of metallic and paper

money in a country, or between the metallic moneys of different countries.

of different countries.

AGISTMENT, d-jiet-ment (old Fr., liceuse for cattle),
a legal term implying the pasturing of a person's
cattle in the royal forests. It is also applied to the
tax paid for such pasturing.

AGLAIA, dg-lai-u, in Ask., one of the group of small
planets revolving between Jupiter and Mars. (See

planets revolving between Jupiter and Mars. (cee Asteroids.)
Ackala, dg-las'-a, in Bot., a genus of dicotyledonous plants, order Maliacem. The flowers of Aglaia advorate are used for perfuming certain varieties of tea.

Ackall, dg-nes'-fi (Lat. nascor, natus [originally gnatus], born to), the relations by the father, who, by the Resman law, were preferred to the cognati, or relations by the mother, till the edict of the emperor Justinian (Nov. 118) abolished all distinctions between them. The conata, or relatives ar parte paternal, are

### Agreement

Roman Catholic church, is the name of a prayer in the Mess, introduced by Bergius I. in 688, and beginning with the words Ayasa Dei. It is also the name of a hymn commencing with these words, sung at the elevation of the Host. Agains Dei is likewise the name given to a round piece of wax, stamped with the figure of a kimb, supporting the banner of the cross. These are consecrated by the pope, and distributed among the people, and are supposed to possess great virtues. Acoustil, do-one; time, festivals celebrated by the Romans in honour of Janus. (See vol. I. of this work.) work.)

work.)
AGONISTABUR, dg-o-mis'-tark (Gr. agonistes, a combatant, and archos, the chief), the superintendent or president of the sacred games, who exercised authority over the sthlets, inspected their discipline, and syarfed the prizes to the victors. In the Olympic, Pythiansand other great public games, these presidents represented different states, or were chosen by and from the people in whose country the games were celebrated.

Agourt, 4-post-te, in Zool., the Chlorenge of Cuvier, the Dasyprocts of Ilinger, a genus of animals belonging to the class Mammalia, ord. Rodenta, and fam. Hystricides. Charac. Toes armed with long and very strong

to the class Mammalia, ord. Rodentia, and fam. Hystricide. Charac. Toes armed with long and very strong claws, and completely separate from each other; hind legs very much longer than the fore; head large, forehead and face convex; eyes full and black; ears short, round, and almost entirely denuded of hair; hair for the most part coarse and bristly, but in some species nearly as fine as the fur of the rabbit; twenty teeth. At the first settling of the West-India islands they were very numerous, and were an article of constant consumption by the Indians; but the planters, finding them too destructive to the sugar-canes, of the roots of which they are extremely fond, have destroyed them in great numbers. Whilst eating, these animals sit or which they are extremely fond, have destroyed them in great numbers. Whilst eating, these animals sit upon their hind quarters, and hold their food between their fore-para. They are exceedingly voracious, and, when they have satisfied their appetite, will hide the remainder of their food for another meal. They live remainder of their about it when timber, are very prolife, and produce young more than once a year. Their flesh is good cating, and they hold in S. America the same place as the hare or rabbit in Europe. There

desh is good eating, and they hold in S. America the same place as the hare or rabbit in Europe. There are seven perfectly ascertained species; viz., the common agouti (Dasyprocta Aguil), known also by the hlack or created agouti (Dasyprocta cristatus), sometimes termed the black or created agouti, the acouchy, or olive agouti (Dasyprocta crossed agouti; the acouchy, or olive agouti (Dasyprocta Acuchi); the White-toothed agouti (Dasyprocta crossed.a); the Dasyprocta grymmolopha; segouti. Hab The hotter parts of S. America, the West-India islands, and Guiana.

AGRARILER LAW, al-gradi-ri-ms (Int. agrarid les), a Roman law for the distribution of lands emong the common people. The object was only the distribution of lands which were the property of the state; first, to have a protection against the mouraions of an enemy; thirdly, to augment their population; fourthy, to free the city of Rome from an excess of inhabitants; lifthly, to quiet seditions; and, stitlly, to reward their veteran soldiers. It contained version provisions: it described the land which was to be divided, and the classes of people among whom, and their numbers; and by whom, and their numbers; and by whom, and their numbers; and by whom, and the territory was to be parcelled out.

AGRERMENT, a greenent (Fr. agreen, in Inw. is where a promise in made on one side. and assented to where a promise in made on one side.

relations by the mother, thit he educt of the emperor it described the land which was to be divided, and the Justinian (Nov. 118) abolished all distinctions between preferred in descents to the cognati, or relatives are parter paternal, are preferred in descents to the cognati, or relatives are parter paternal, and by what preferred in descents to the cognati, or relatives are parter maternal, which agrees with the laws of the Hebrews and Athenians; though among the Greeks, in the time of Hesiod, when a man died without wife or children, all kie kindred, without any distinction, divided his estate emorget them. The Balgish law is conformable to the castemary law of ancient Normandy.—Ref. I Bit. Com. b. 2, pt. 1. ch. xi., and the authorities there nied.

AGROMEN, 13 and 16 to conform promote in the collection of the constance in his life. It was the fourth in order of the conformation to a person on account of some distinguishing circumstance in his life. AGRICULTURER SOCIECTES, INSTITUTIONS, SOCIETIES FOR THE PROMOTERS OF ARRICULTURE.—The Improvement of every presents of knowledge in agriculture has been largely developed by the establishment of agricultural societies. The Beard of Agriculture, which owed its mistrates to the exertions of Ser John Sinclair, was indicated an attended and the Smith and West of England Society published its. "Reseasettons" before that time. The celebrated Royal Agricultural Society of England Society published its. "Reseasettons" before that time. The celebrated Royal Agricultural Society of England was satisfied and the Set and West of England was satisfied in 1859, and reseived its charter of incorporation in 1868, and reseived in the seculity of the international sequences of the mistorial sequences and the mistorials were established to 1.104. Its first meeting was held to the reversal of emission saccondations associately and to the formation of new ones. In the United Emission there are 450 lead agricultural societies, some of which hold memoral provision of account of the parison county. The Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of Agriculture, in Society of Improvers in the Knowledge of A

land was established in 1841. Abroad, various meti-tations here been designed for the improvement of agriculture; and at Mahetheim, are miles from Stati-gall, as Jolf palace has been converted nin an agrecu-stral sellings. In Revents, a model farm is attached to the rotal palace of Schloushosma, and in terminal minimum schools.

Association of the selling that the case of the

is the point primer of Schuczkonkern; and in twenty interpreta Singuistics there are not less than 362 agricultural primers. In the primer of the state of the st

marsh," says he, "formed by the depositions of the Nile, the principal parts of Upper Reyrle was a valley, several miles broad, bounded by mountains, and, on both sudes, declining to the river. Hence it was overflowed only for a certain time and assaon, the waters rapidly declined, and the ground, earliched by the mud, was soon dry, and in a state it to receive seed. The process of cultivation in this country was also most obvious and natural; for the ground, being every year covered with mind brought by the Nile, and plants spanning up apontaneously after its recess, must have given the bint that nothing most was necessary than to scatter the seeds, and they would vegetate. Secondly, the ground was prepared by nature for receiving the seed, and required only stature for receiving the seed, and required only stature for receiving the seed, and required only stature for making he sand, which he prepared and cleared from plants, and, secondly, that the maxime of rich mould and sand would produce facility. What is here stated may appear without familiation as to Typer Reyre to because, at present, in the staining of Theber, water is raised by are, Sut this objection is elected by the testiment of Dr. Formick, who is suphism that formestly up are all the superiored in steppic, or not, is a present or serior was a first cultivated in steppic or the superiors of the soul was proposed in a general concernance of testimony, we are usade aware that the outless of the soul was any stated on sentent or the soil was because, the latter stated in the present of the superiors of the soult state and state and states, the latter stated in the superiors of the superiors of the soult state states for the superiors and states, the latter stated are constituted by occur. with, was a kind of pick, which, by de proved into a surt of blanch. With Contr. proved into a surt of pitterned up the sail in turned up the sour our own practice is broadcast from a benchioned in our raria.); but He practised; and inditants of the eave that " no thoms. When so with a sortise, or out into the sortise and som floor in the bank. If the since floors wer ground in the open as flooring floors were ground in the open as into isheaven, and according to a series we may communicate the history. They make shade of threshing, and the charaching-linear wave, as they still into, level plots of ground in the open six. The mands of threshing, and the cantrumnate completed in it, were various, as we find by the following tamings in The lands, artiful, 27, 25. "Fitches are not dispassed with a direction with a seal, and the cummun with a rad. Bread-our is leaded, artiful, 27, 25. "Fitches are beston, out with a stall, and the cummun with a rad. Bread-our is leaded, because he will not ever he threshing it, nor break it with the wheel of his earl, not bridge it with his barremen." Of the manures employed by the Reystians, we possess bride or no knowledge; and although his said that they desputed the projection of a shapehed, yet do we find Pharach expressing a misk to sceleth to have a Jewish buillifor the supersistic of its Rades :- "If thou knowed any mak of activity among them, them make them rules over he catfile." (Cathean, xivii. 6) In reforence to the landed estates of the Egyptans, we find that they grow to be very large. Ususah, king of Judah, "had much, both in the low country and in the plans; husbandmen, also, and vine-dressers in the mountains and in Carmel, for he loved husbandry." (2 thron xivi. 10.). We also find that Job had "14,000 sheep, 6,000 causies, 1,000 roke of caca, and 1,000 she axes (400), i. 3; xis. 12. He was the greatest man in the Rast; but, in the time of Isaakh, the accumulation of landed property had risen be such an extent, that a curse was sittleted against the practice. "We must be landed for property, and risen to such an extent, that a curse was sittleted against the practice. "We unto them," says the prophet, "Ital jons house to house, that they may be placed alone in the midst of the earth." (Isaah, v. 3). For some valuable and interesting notes in connection with Scripture of the aground. Finally Bithe."]

Greek dericultions.—Of the modes of cultivation practiced by the Greeks is chiefly derived f

still is in modern of the continent, thorns and other agriculture were the cultivation; besides an and other fruits. sheep, goats, swins, house was used for facilities have have no knowledge white plants were in use. As order to clear the remarks," the men is they see occasion,

History.—Some landwinding of the internal structure
of the human body was doubtless obtained at a very
carly period. The suscient Exprisms are said to have
acquired great enatomical skill from their practice of,
embalming, and Heaser displays a considerable amount
of knowledge of the human body in his description of
wounds, in the "liest." Elippocrases, who flourished
about 400 years acc, is regarded as the first author
who treated anatomy as a sornice. Erasistratus, and
Herophilus of Alexandris, are considered as the lirst
that, dissected and described the human body, nearly
300 yeters are. Galen, however (a. 131 a.D.), is the
author of antiquity that displays the most intimate
knowledge of the human body; and even he evidently
the dissected a great part of his knowledge from dissections ofteness and other animals, there being a law in
Rome subth forbacke the use of dash bodies. During
the darksages, awatemy, like the other sciences, made Rome which forbade the use of dead hodies. During the dark ages, systemy, like the other sciences, made little graguess. The interest in austomy began to revice about the 13th century, and, in the beginning of the 18th, Mundinus dissented and demonstrated the different parts of the human body, at the University of Bologas, and published a work which formed the text-book in Italy for nearly 200 years. During the next 200 years, the interest in anatomy continued to increase, and, within that period, there are several respectable names is connection with it; as Gabriel de Zerbio, Achillini, Berenger, and Massa. The errors of Galen, however, still prevailed till the time of of Galen, however, still prevaled till the time of Vessius, who flourished about the middle of the 16th Vessius, who flourisized about the middle of the 18th century, and boldly, by dissections of the human body, pointed out the errors into which he had fallen. He is regarded mighle father of modern anatomy. His great work, De Corporis Humann Fabrica, was published before he was twenty-eight years of age. He gave a great impulse to human dissection; and, among his contemporaries, or immediate successors, were Falloping, Enstaching, Varoli, and Fabricius. In the 17th century the progress of anatomy was rapid. In 1619 Harvey's great discovery of the circulation of the blood was announced. Asellius, in 1627, gave out his discovery of the lacteds; and in 1651 Rudbock of the blood was announced. Ascisus, in 1827, cave out his discovery of the locteals; and in 1651 Rudbeck discovered the lymphatics. Among the other distinguished anatomists of this century were Bartholin, Peoquet, Jolyffie, Wharton, Swammerdam, Willis, Malpighi, and Enysch. In the 18th century we have many eminest names. In 1taly, which still retained a first place, were Valsalva, Santorini, and Morgagni; in France, Wisslew, Vicq d'Azvr, and Bichat the founder of General Anatomy); in Germany, Haller, Meckel, Zing, and Soemmorring; in Holland, Boernawe, Albinus, Camper, and Bonn; and in England, Cheseiden, the two Hunters, Charles Bell, and the Mources of Edmburgh. The present century has been specially characterized by the great advance made in minute or microscopic mentory. Among the names of this period may be mentioned Cloquet, Magondie, Miller, Quain, Gooder, Bewman, Todd, charper, Ellis, Wilson, Gray, and Holden. Ref. Quain's Anatomy; Gray and Holmes's Anatomy; Vade-mecons. Vade-mecum.

Angestole, sin season (Lat. antensaor, from onle, before, and ordo. I go), one from whom a person is descended, either on the father or mother's side, at any distance of time. All nations in any way civilized any distance of time. All nations in any way civilized respect the memory of their ancestors, and some have seen offered them religious homage. The feeling is

and his ansestors, and the other to a corporation and

and his ancestors, and the other to a corporation and their predocessers. (See Purdressors.) Archor, da'sher (Lat. anchora), an instrument of iron used by sitips to hold them to their moorings. Their quisming is searched to various persons. Anchors originally, were large stones of pieces of wood, loaded with heavy weights. The first anchors that approached the prevent abuye had hot one licke; afterwards matter was saided; but then, as appears from mon-ments, they had no

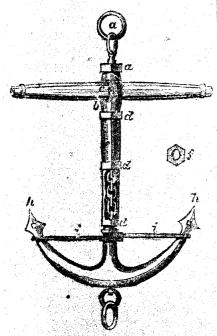

ments, they had no stock; which addi tion may be considered the last step to their present form. The technical parts of an anchor are as follows.—R, the ring; ABC, the shank; A, the small; C, the threat; B, the trend; DCFE, the arms; D, the pain, or fluke; E, the bill, or peak, or pea. The chunk is the central shaft; the small, the end of the shaft near the top; the throat, the end of the shaft near the hottom; the trend, two-thirds down the longth of the shank; the ring is at the upper end; the stock spreads out beneath the ring; the arms brunch out at the

ANCHOR. Dranch out at the other end of the shank; the palms, or futes, are the flat portions at the ends of the arms; the bill, or peak, or pea, is the extreme end of each nalm; the crown is the part farthest from the ring. Men-of-war and, very large ships carry two large anchors of equal size at the bows, hence called bower anchors; and two others of the same size, which are called the sheet and the spare anchors; besides two or three smaller ones. When the anchor is let go from the ship's bow or side, and others the water, it will generally strive at the bottom of the sea in an upright position, in consequence of the resistance of the water on the stock; it then is turned or canted over, and rests on the it then is turned or canted over, and reats on the crown, the end of the stock, and the corner of a fluke. Anchors are made of flat broad bars forged together. Mr. Pering introduced the improvement of forming the shanks of bars of equal broadth and depth. He has also invented other alterations, and it is upon his plan that anchors have lately been constructed. When one anchor is down, the vessel is said to be at single anchor: when two are used, the vessel is generally said to be moored. When the suchor is dragged by the pulling of the cable, it is said to come home; when the cable is twisted round the anchor or stock, the anchor is said to be foul; when the anchor is lifted out of the ground, it is said to be awaigh; when hore up to the surface of the sea, it is said to be awash. The weight of an anchor in mea-of-war may be roughly The weight of an anchor in men-of-war may be roughly estimated at lewt to each gun; in merchant-vessels, about I cwn to each gun; in merchant-vessels, about I cwn to each 20 tons. Within the last quarter of a century several improved forms of anchors have been introduced, the most important of which have been those of Porter, Lienti. Rodgers, Honiball, and Trotman. The most efficient eacher in use at the present time would appear to be Trotman's, which is an important form of the authorizate and in Porter. improved form of the anchor patented by Porter. In 1852 the Board of Admiralty ordered a series of experirespect the memory of their ancestors, and some have oven infered them religious homage. The feeling is on that which produces respect for the best anabors than in use. Thisse were tested in respect to the following qualities:—Strength, weight, parents. It is, however, spt to lead to error, in studing under importance to their knowledge and respectively. All the strength of these experiments was that the palm of experience. All enstern nations are proud of a long into of ancestors.

Ancestors, in Law, one who goes before in order of time, and from whom we descend by birth and lineage. The law makes a difference between an accestor and a predecessor; the one being applied to a natural person the great these areassary to weld such large masses the ments to be made with the view of testing the qualities

iron is hable to become what is technically termed In the welding of a large piece of metal like the shank of an anchor, by employing the sledge-hammer, the workmen are subjected to a scorebing heat radiating therefrom, which renders it impossible to make a very close inspection; consequently the beating up of cinders within the body of the iron frequently occurs. Of late years many attempts have been made to construct anchors which shall be free from these faults. One of the best and most charac-teristic of these inventions is that of Mr. Hawkes, who observes:—"The anchors at present in use are made by forming the shanks and flukes separately; and by the rapid action of heavy hammers they are united or wolded into each other; and the cable is fastened to a ring passed through the shank sidewise. The stocks, if of wood, are let or scored over each side and bolted and hooped over the shank of the anchor;—if of iron, the eye, or hold for it, is formed by punching a hole through the shank of the anchor; the pains are made separately and welded on the fluxes. The improvement consists in making one fluke and half the shank in one piece, and to bend them to the form required, and then hooping the two halves together. This method of making the another is separate parts admits of the forming of a groove up the middle of the shank for a chain to pass through, and of an eye of great strength for the reception of a wooden stock, which is also made in two pieces, and passed into the shank in reverse directions; these having iron shoulders abutting against the eye, are kept immorably in that posi-tion by being braced together with an iron hoop at each end. The construction is shown in the annexed engraving:— $\alpha$ , the cable ring; b, the eye which holds the stock made out of the whole substance of the

MR. RAWKES'S ANCHOR.

shank, by hending each of the helves in a semicircle in opposite directions. The suchor is shown to be divided into two equal parts by a line which passes down the middle of the shank, as at oo; o, the wooden stock, made also in two equal parts, as before discribed,

and firmly sourced in their places by the hoops and shoulders; d, d, d, d, are four strong hoops which hind the shank together,—the upper one is made square, and the others circular; a portion of the shank is supposed to be removed to exhibit the situation of the chain which passes up the centre, and is connected at the upper end with the cable ring, and at the lower end with the buoy ring; f, in the small separate figure, gives a transverse section of the shank of the anchor, showing it to be of an oval form, the longest diameter of which is in a line with the flukes; this figure conferring upon the great strength to withstand the powerful strain to which an anchor is frequently exposed in that direction; h, h, are the palms bolted to the respective fluires, each of which is connected in one piece with a brace; i, i, passing in opposite directions round the shank of the unchor, thereby strengthening the flukes in a great degree and giving a colliseral support to each half of the anchor; k is a strong plate of iron holted on the crown; l, the buoy ring.

Anchor, in Arch, an ornament ou mouldings of all the orders. It resembles an anchor, and is intermixed

Angron, in Arch., an ornament of mouldings of all the orders. It resembles an anchor, and is internated with eggs. Some writers style this moulding a tongue, from the likeness it bears to the forked tongue of a serpent. The wrought-iron ties that are placed in the walls of buildings, to prevent them separating, are also called anchors. The term is also applied to part of the collar of a lock gate.

Ancugaces, outleardy, a safe place for depositing a ship's anchor, that it may hold the ground firmly. Stiff clay and bard sand offer the best anchorages, and the best position for a ship at anchor to take, is out of the tide or in a land-locked place. The term anchorage is also applied to the dues paid by ships for easting anchor.

ANCHORITE, Nu-ko-rile (Gr. anachorea, I withdeaw or ctire), a hernit, or one who withdraws himself from seciely, in order to avoid the temptations of the world, and to devote himself to geligious daties. Tays lived in caves or desert places, and usually practized great austerities, subjecting themselves to the inclemencies of the weather without proper clothing or habitation, restricting themselves to coarse and soanly fare, maintaining painful postures, and wearing iron rings or chains. They sometimes obtained great

ANCHORITE

fame for sanctity, and were visited for their blessing, or from a belief that they possessed the power of curing diseases. Many of the early Christians had to retire to solitary and desert places, in order to avoid persecution; the order of Anchorites, however, arose in the 4th century, and Paul the Hersuit, Antony, and Hilarion, are said to have been the first. As souvents began to increase, these came generally to be preferred

organ to increase, tasse came generally to be presented as places of retreat.

Anonovy, an-tcho'-ne, or an-chose (Fr. anchois), in Ichtha, a gen. of abdominal malacopterygious fishes, comprehended by Linuaus in the Clupes, or Herrings, but separated from them by Baron Cuvier. (See

# Anchovy Pear

CLUPEIDE.) With the exception of the common anchory, they all inhabit the tropical seas of America and India. The common anchory is found Atlantic, along the shores of France and Portugal. It is sometimes taken off the coasts of Holland and England; but

is abundant in the Mediterrancan, where off the island Gorgona, of to the west of Leghorn, it is very plentiful. The months of May, June,

ANCHOYE. and July are the shores of the Mediterranean, which they enter in immense shoals by the Straus of Gibraltar. The Romans compounded from them a favourite sauce, which they termed garum. In modern times, the an-chovy is also regarded as an appetizing morsel in the form of pastes, &c. Charac. Colour, bluish-brown on the back, and silvery white on the belly; and fin short. and the dorsal placed immediately above the ventral Size, about three inches.—For Anchovy recipes, see Mrs. Beeton's Household Management.

Anchovy Pear. (See Grits).
Anchovy Pear. (See Grits).
Anchovy Pear. (See Grits).
Anchovy Dearth of plants belonging to the nat. ord. Boraginacco. The cutyx is divided into five segments; the corolla is funnel-shaped, the mouth of the tube being closed with five scales; the stamens are five in number; the stigma is obtuse and the achievia, which are evate, are surrounded by a thick ring. The species are herbaceous plants, by a thick ring. The species are herbaceous plants, growing in temperate climates, and are all characterized by short stiff hairs on the leaves and stems. by short soin mars on the raves and strins. An arrinhalizants of Great Britain; namely, A. efficientis (the common alkanet or bugloss) and A. semperainens. The roots of the former, when boiled, yield a demulcent drink, which was once much used as a medicine. Both plants have spikes of blue flowers, very similar to those of the forget-me-not. The most important species is A. linetoria, a native of the Levant and of the southern parts of Europe. It is collivated for its root, which contains a resinous red colouring matter, and is much used in the arts. (See ALKAKET ROOT.) A. paniculata and some other species are grown as ormancital garden-plants.

Anchusic Acid, or Anchusin, &n-choo'-sik, the resinous colouring matter of alkanet root. The solubility of this principle in oil renders alkanet root useful for colouring that substance. Hair-oil is gene-

rally coloured pink with alkanet roet.

Anchyrosis, in-ki-lo'-sis (Gr. agkaloo, I bend), a term used in Med. to denote an immovable or fixed state of a joint. This condition may attack any joint state of a joint. This condition may attack any joint of the hody, and instances have been known of the whole body thus becoming anchylosed. In complete or true anchylosis, no motion whatever takes place, the heads of the bones being connected together by cessous or bony matter. In incomplete or false an chylosis, the immobility arises from eddesion of the synovial membrane, or a thickening of the parts about the joint, and usually admits of some degree of motion. Analylosis frequently occurs after sprains, dislocations. or fractures near a joint, and, indeed, may be occasioned by anything that keeps a joint long motionless, In order to prevent anchylosis, the joint is to be exercised as much as the state of the surrounding parts will admit; if it cannot be prevented, the joint is to be kept in the most convenient and natural position.

the kept in the most convenient and natural position. Analysiss is sometimes very desirable as a termination of painful diseases of the joints.

ANGIEST, aid-cheat (Fr. ancien, Lat. antiquus), usually signifies very old, and is applied to something that existed or happened long ago. It is said that old relates to a thing itself, as an old house; ancient, to time in general, as an ancient custom; but this distinction is not always observed. In a more limited sense, it is applied to that period of the world's history which receded the overthrow of the Roman empire in the West, and, in this sense, it is opposed to modern, which applies to the period since that event; but even this 69

## Andante

distinction is not always observed. The term ancients Romans; na when we speak of the philosophy of the ancients. In speaking of a thing which existed formerly, but-which has now ceased to exist, the term ancient is frequently used.

ANCIENTS, gentlemen of the inne of court and chancery. In Gray's Inn, the society consists of benchers, ancients, harristers, and students under the bar; and here the ancients are of the barristers of the longest standing. In the Middle Temple, such as have gone through, or are past their readings, are termed ancients. The lans of chancery consist of ancients and students, or clerks; and from the ancients, one is

yearly chosen the principal or treasurer.

ANGILE, cin. si<sup>\*</sup>-le (Lat.), in Romau Antiq., a sacred shield, which was believed to have fallen from heaven during the reign of Nums Pompilius. It was an object during the reign of Nums rompinus. It was an object of veneration, more especially on account of the tradition, which declared that so long as Rome possessed it the empire of the world should be hers. This holy buckler was placed in the keeping of twelve priests, in the temple of Mirs; and in order that it should be the more effectually preserved, cleven other shields were made, so much like the true ancile, as not to be distinguishable from it. The ancile was held to have descended to the earth upon the calends of March, and, consequently, the tweive aucilia were once every year, at this period, carried round the city in solema procession.

Ancilla, or Ancillaria, an-sil-lai'-ri-a, in Zool., a term given by Lamarck to a gen. of mollusca. They are somewhat numerous, principally found in tropical climates. Some of them are furnished with a small tooth, which is placed at the end of a groove crossing the front of the shell. The most common species is the ivery-shell; this and some others are distinguished from the genus in general, by having the front of its axis deeply pierced. The shells are usually very amouth, as if polished.

ANCONEUS, an-ko'-ne-us (Gr. agkon, the clbow), in Anat., a small triangular muscle, situated immediately beneath and behind the elbow-joint. It is connected with the humerus above, and the ulna below,

and assists in extending the fore-arm.

ANCYLUS, ön-si-lus, in Zool, a molluse, commonly known as the fresh-water limpet. It is common in stagnant water and rivulets in Europe, America, and the West Indies, adhering to stones and plants. is closely allied to the pond-snail, differing principally in the conical form of the body and shell. It agrees with it in having two compressed triangular tentacles, with it in having two compressed triangular tentacles, with the eyes sessile on the outer base. A early in the middle of the back serves for the purposes of respiration, and an aporture closed by a valve opens in the middle of the left side. These shells are occasionally mistaken for those of the Syphonaria; but they may be readily distinguished by their being sinistral, very thin, and covered with a bairy periostraca.

ANDA, int-di, in Bot, a gen, of plants belonging to the nat, ord. Exphorbiacea. The species d. brashiensis is a tree which grows in Brazil, having large vellow theorem. and producing fruit about the size of

yellow flowers, and producing fruit about the size of an orange, but of an angular form. Each fruit conan orange, but of an angular form. Each fruit contains two roundish seeds, resembling small chestnuts. These seeds, called Parga dos Paulistas, yield a very purgative oil, used medicinally in Brazil, the ordinary dose being twenty drops. The seeds are also used for the same purpose as the oil. The bark, when thrown into ponds, is said to stupely fish; and this part of the tree, roasted, forms a favourite remedy for darrhoes brought on by cold. No other species is known.

ANDANYE, an-dan-tas (Hal.), in Mus., a term used to imply a time supershat slow, and a performance dis-

imply a time somewhat slow, and a performance dis-tinct and exact. It forms the third of the five divisions of musical movement, and may be said to be the medium between the extremes of quick and slow. It is likewise used substantively, thus:—an "Andante of Haydn," &c. Andante offstuons, slow and with feeling; andante con mato, a little faster than sudante; increms; amounts con moto, a new master than unusate; and unite oraziono, show but gracefully; and anothe large, or largo and ante,—by this expression is understood that the performance of the movement to which it is prefixed is to be slow, distinct, and exact; and ante master accessos, slow with majesty; and ante non troppo, slow,

## Andira

but not too much so; andante pastorale, slow and with

pastoral simplicity.

ANDIEA, du-dit-ric, in Bot., a gen. of piants belonging to the nat. ord. Legensinees, sub-ord. Papilionaces, characterized by a one-ordine one-seeded pod. lienacea, characterised by a one-celled one-seeded pod, almost orbicular. The species A tree-wis is a native of the West Indice, and is commonly known as the Cabbage-bark tree. The bark, called either cabbage-bark or worm-bark in commerce, was formerly nuchused medicinally as an anticominate (see this word). It possesses cathartie, smetic, and narcotic properties. In large does it is poisonous. The tree is said by some authors to furnish the particings-wood of the cabinet-makers; but a plant belonging to another order is named by others as the source of this ornamental wood. (See Harstrain.) The species A reisso, a native of Surinam, yields bark with similar properties, which is commonly known as Surinam bark.

Andrinon, of Harstrain, and in Arch., a contrivance which was, in old English houses and halls,

ANDIRON.

lish houses and halls, made use of to assist in the burning of the logs of wood placed upon the hearth. In old inven-tories of furniture, the term is frequently employed; and at the pre-sent time is sometimes used for what is more used for what is more commonly called a fire-dog. The andirons were used in pairs, one on each side of the hearth. The logs of wood were placed upon the horizontal bars, the upright portion, or standard, being merely ornamental. The standard frequently bore the armorial bearings of its

owner; and sometimes arabesques, or other designs,

ANDIEST. armorial bearings of its owner; and sometimes arabesques, or other designs, were traced upon it in silver, particularly in the reign of James I. At a later period, the upright portion of the auditon was often fashionedso represent a human figure. In the hall at Penshurst, Kent, a large andiron it still to be seen standing upon the hearth.

Andersas, da-dre-dd-se-s, in Bot., Split mosses, a fam. of terminal-fruited mosses, characterized especially by the peculiar mode of splitting of the fruit, or, more correctly speaking, the sporangium. This urnshaped capsule divides perpendicularly, when ripe, into four or eight valves, which remain attached together at their upper and lower points. The few British species which constitute the gen. Andersa are natives of rocky and usually mountainous districts.

Andersands. (See Bries.)

Andersands. (See Bries.)

Andreasum or male organs of a flowering plant, taken collectively.

collectively.

Andrews, in Bot, a term sig-nifying male-female, sometimes applied to that kind of inflorescence which exhibits distinct male (staminal)

Andrews, its design to that kind in modern makes applied to that kind in moderacence which exhibits distinct male (staminal) and female (pistiliate) flowers.

Andrews, and design to the control of the of inforescence which exhibits distinct male (staminal) and female (pistillate) flowers.

And prottes, and of index (Gr. andres, of man, and eides, form), a term used in Mech, to denote an automaton in the figure of a human being, which, by nearly of a combination of springs, levers, &c., skiffully contrived, either walks or performs other external functions of a man. The ricest effects and automated figures of men which have been exhibited in modern times, are, the fluts-player of Vancasson, constructed and exhibited at Paris in 1810; and the chess-player of M. de Kempelen, of Presburg. (Sec. Automaton.) AUTOMATON.)

## Anecdote

lation named by the Greeks after the mythical daughsecon named by the creeks after the mythrest daugh-ter of Cepheus and Cassiopeia. This constellation— a very fine one—is composed of fifty-nine stars, and occupies a considerable region of the heavens som occasiones, by which it may be easily found. A line drawn through the brightest star of the five forming the latter constellation and the Pole-star passes through a star of the first magnitude, named Alpherst, in the head of Andromeda. This constellation is represented in the celestial planisphere by the figure

represented in the celestial planisphere by the figure of a chained woman.

Androwness, in one for (Gr. ener. male, phores, brought into), in Bot., a name given to a tube or column formed by the union of the stamens by their filaments, as in the flower of the mallow.

Androwness in the flower of the mallow.

Androwness of the mallow. name. Many species are remarkable for their fragrance, which is due to the presence of volicile oils, same of which are used in perfumery and medicine. There is considerable uncertainty, however, as to the particular species which yield the different oils. A treavacusa is supposed by some to have furnished the precious spikenard oil of Scripture; and A. calcanus aromaticus has been pointed to as being probably the plant termed the sweet calamus and sweet cane. The oil knawn in India as roshé or roxé oil, and, in England, as Turkish essence, or oil of geranium, and oil of ginger-grass, is reputed to be the produce of the latter species; but, in all probability, it is derived from several Indian andropogons. This oil is employed by the Turks to adulterate otto of roses, and is considered by some to adulterate otto of roses, and is considered by some to be identical with the grass-oil of Nemaur. The species A. citratum, Indian lemon-grass, is most likely the source of the oil of lemon-grass of the shops, which is source of the oil of lemon-grass of the shops, which is much employed in performery, under the name of oil of verbena, from its odour resembling that of the sweet verbena, or lemon-plant. Citronelle, or citronelle oil, is also the produce of this, or of an allied species. The leaves of the Indian lemon-grass have been used as a substitute for tea, and the centre of the stem is employed for flavouring curries. A. muricatus, vittievar or cuscus, also yields a fragrant oil, which is much used medicinally in India, and there known as kuskus oil. Its root, which is imported into this country for scenting baskets and other articles, has been employed medicinally as a gentle stimulant and antispasmodic. antispasmodic.

ANDROSERUM, androse mum, in Rot., a gen. of plants belonging to the nat. ord. Hypericacea. The species A. officinals has tonic and astringent properties,

which render it useful in medicine.

ANDROUS, introduct, in Bot., a term signifying a stamen, which is sillxed to the Greek namerals, in order to form names used in describing flowers, when it is desirable to indicate the actual number of stamens they contain. Thus, the presence of only one stamen makes a monandrous flower, as in the Hippuris; if two male organs are present, the flower is diandrous, as in the Ash and Privet. To complete the list in as small a the Ash and Privet. To complete the list in as small a space as possible, we will merely give the terms, number of stemens, and examples, thus:—triandrous, three, most of the grasses; tetrandrous, four, Holly and Plantain; pentandrous, give, Cowsip and Convolvalus; heavandrous, six, Lily and Tulip; heptundrous, seven, Esculus and Trientalis; octandrous, eight, Ivy and the Heaths; enmeandrous, nine, Flowering Euch; decondrous, ten, Pink and Saxifrage; dedecandrous, twelve, asseraluces: consupersus. twenty. Strawherry: nodura-

#### Analectric

Græca of Muratori. In common language, an anecdote is a detached incident or fact of an interesting nature, usually connected with the life of a distinguished individual.

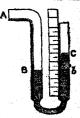

guished individual.

Argueranc, in 'e-lek' trik, in Phys., a term sometimes applied to a body in which, under ordinary circumstances, electricity cannot be entited by friction. It is synonymous with the more familiar word non-electric. Ancelectrics have the power of transmitting or conducting electricity. The best conductors, or the most perfect analectrics, are metallic bodies, charcoal, and saline fluids. (See ELECTRICITY.)

ANEMIDICTION, "m-e-mi-dic-ti-on (Gr. aneimon, naked; diktyon, a net), in Bot., an ornamental species of ferns, succeeding well in open loamy soil.

ANEMIOPSIS, in-e-mi-op'-sis (Gr. aneimon, naked; open, appearance), in Bot., so named in allueion to the appearance of the inflorescence. A genus of plants growing in marshes and pools of water in North India, North America, and China.

ANEMOMETER, an-e-mom'-e-ter (Gr. anemos, the wind; ANEMOMEREE, on-e-most-e-ter (Gr. anemos, the wind; metron, a measure), an instrument for measuring the force of the wind. Of the many anemometers which have been devised, that of Dr. Lind-is the best for ordinary observations. It consists of a curved tube of glass, partially filled with water and attached to a cale. The tube is bent into somewhat the shape of the letter U, and the bore is considerably contracted at the batturn as a check or the oscillations to which at the bottom, as a check on the oscillations to which the water is subject from alight variations in the force of the wind. One leg of the tube is rather longer than the other, and its upper part (A) is bent at right angles, so that the wind may blow into it horizontally. The wind, by acting upon the water in the one leg, causes it to rise in the other—that is to say from B to C,-until the pressure of the column of liquid balances the force opposed to it; consequently, the height at which the water stands indicates the strength of the wind. Another common ane-

DR. LIND'S ANEMO. METER.

mometer consists of four small metal vanes fixed to a horizontal axis, and made to revolve like the sails of a windmill. On the axis is a perpetual sorew, which turns a vertical cog-wheel round a second axis placed transversely to the former. To the second axis is attached a bar, on which a weight is fixed, so that the sails cannot turn withthat the sails cannot turn with-out moving round the bar in a vertical circle. When the wind acts upoy the sails, the bar rises; and this continues until the increased leverage of

the weight furnishes a counterpoise to the moving force of the wind. The number of degrees through which the bar is moved to produce this effect is

BOBINSON'S ANEMOMETRE.

Anemones, Sea

a petaloid calyx, scarcely distinguishable from the corolla; and soft, woolly achemia, which in some species have sally tails. As many of the species species have sally tails. As many of the species flourish in very exposed situations, they have been called wind-flowers. The most remarkable English species are A. nemous and A. pulsatilla. The first, which is commonly known as the wood-anemous, is one of our earliest spring flowers, and may be assisted to the second of our earliest spring flowers, and may be assisted as the second of our during March and April in simost any wood. It is a perennial plant, with knobby roots and a short stem, having one or two dark green deeplycut leaves. The stalk bears a single flower, the calyx of which is white, delicately tinged on the outside with purple. The species Fulsatila is the beautiful pasque-flower found growing wild on exposed downs in several parts of England. It has finely-cut hairy leaves, and large purple flowers, very silky on the outside. The various garden anemones which exhibit so many brilliant colours, are cultivated varieties of the Levant. The natural size of each flower is increased by cultivation, and many of the stamens are a petaloid calyx, scarcely distinguishable from the the Levant. The natural size of each flower is in-creased by cultivation, and many of the stamens are often changed into small petals, or, in other words, the flower becomes double. The anemones have, in common with other Kannnoklacea, very acrid proper-ties. Thus the leaves of the pasque-flower will raise blisters of the skin, and, if chewed, will produce irri-tation of the threat and tongue. The acridity of the roots of this species is so great, that, when adminis-tered in very small doses, it occasions nauses, and sometimes causes violent vomities.

sometimes causes violent vomiting.

A NEMONES, SEA, the popular name for the plant-like animals formerly included in the gen. Actinia, but like animals formerly included in the gen. Actinia, but now distributed in several genera. (Sec ACTINIA.)
They are found on all shores, generally attached to the rocks which are only exposed at low tide. A great number of beautiful species are common to our English coasts, but the larger and more brilliant ones cocar in tropical seas. When fully expanded, their tentacles, which are usually richly coloured and arranged in regular circles, greatly resemble the petals of some of our most symmetrical simple flowers, such as the paraicold carnation, and absence: or still more marigold, carnation, and anemone; or, still more closely, the florets of composite flowers, such as the daisy and chrysanthemum. This resemblance suggested the names sea-anemones and animal-flowers, by which they are commonly known. Since the invention which they are commonly known. Since the invention of the aquarium (which see), these humble creatures have become household pets, and their habits have been carefully studied. It is only in the aquarium that they can be seen to advantage; for when exposed on their nativerocks by the fall of the tide, they appear either like amooth lumps of opaque jelly or as mere sand-coated excrescences. In each hemispherical or sand-coated excrescences. In each nemispherical or conical lump, however, a puckered hole, indicating the position of the month, can generally be detected. When placed in their proper element, and allowed to remain undisturbed, the sea-anemones gradually unfold their tentacles, and prepare to take into their elastic stomachs any dainty morsels which come within their stomachs any dainty moresis which come within their reach. They are extremely voracious, and though apparently mere masses of jelly, they can digest almost anything. The tentacles seem to have the power of benumbing the prey, for little worms seized by them struggle for a few moments, and then become paralyzed. A slight tingling or pricking sensation has been felt by some observers on touching the tentacles with measured on a dial, the hand of which turns on the axis of the cog-wheel. By an ingenious instrument, which has been recently invented, the fluctuations of the wind are registered on a sheet of paper made to movable plate on which the wind acts. Dr. Robinson's nemometer exercise, upon a vertical revolving shaft, four horizontal arms, at the extremities of which are four hemispherical cups: these cups are ascertained for revolve at the rate of one-third of the velocity of the wind. By the aid of wheelwork the revolutions of the wind thus shown. (See Arronxwamics.) AREMONE, anewo-o-ne (Gr. anewos, the wind), in Bot, a gen. of plants belonging to the nat. ord. Robinson's plantson p the hand, and the microscope has revealed the existence

## Aneroid Barometer

is a circle of azure tubercles, resembling turquoise beads. The species Activoloba diunthus, so called from its resemblance, when fully expanded, to the carnation, or diunthus, is generally pure white, or slightly tinted with cream or rose-colour. It is considerably larger than the smooth sea-anemone, and is the most coveted species of sea-side naturalists. *Tealia crassicornis*, the thick-horned animal-flower, has fewer tentacles than the creatures we have mentioned, and these organs are beautifully translucid, and marked with coloured rings. It is one of the largest, and certainly the most curious of our British sea-anemones. There are a great number of species, besides the three numed above, found on our coasts.—Ref. Gosse's History of British Sea-Anemones; Johnston's British Zoophytes.

Artica Nea-Amenones; Johnston's British Zoophytes.

Arkeou Baromerer, inde-roid (Gr. a, without, meros, watery, and eidon, form), the name given to an ingenious instrument for indicating the variations of atmospheric pressure without the aid of a liquid, as in ordinary barometers. Its action depends on the principle, that if a very thin metallic tube be coiled, any internal pressure on its sides tends to uncoil it, and any external pressure to coil it still more. The instrument essentially consists of a thin metallic tube, curved so as to form about seven-eighths of a circle. This tube, being exhausted of air and hermetically closed. is fixed by its middle, so that whenever the atmospheric 18 tixed by its intentions, it uncoils; and, on the other hand, whenever the pressure increases, it contracts. The ends of the tube are connected by lovers with a needle, which travels over a scale, on which are marked divisions corresponding to the inches on the scale of the mercurial harometer. In another modification of the mercurial harometer. In anomer modulcation of the aneroid barometer, the pressure of the atmosphere acts upon a circular metal tox, about three inches in diameter and a quarter of an inch deep, which has been nearly exhausted of air and then soldered air-tight. The sides of this vacuum-box are very clastic, being corrugated in concentric rings, and they approach to or recede from each other, according as the pressure of the atmosphere is great or little : in fact, the metal box may be regarded as an extremely sensitive spring. 1340.

The index hand in this instrument, as in the other, is connected with the essential part by an ingenious arrangement of levers and springs. Mr. 5. Browning and M. Bourdon have also devised improved barometers upon this principle. (See Atmosphere, Barometer.)

ANESOHIBER, DAROHTER.)
ANESOHIZA, ün'e-ce-ori'-za, in Bot., a gen. of plants belonging to the nat. ord. Umbeltiferæ. The species A. cupensis is cultivated as an esculent vegetable at the Cape of Good Hope.
ANESTHEN innel the confirm

ANETHUM, and thum (Lat. anethum, dill, anise), a gen. of plants belonging to the nat. ord. Umbellifera. The species A. grayedens is commonly known as the

Dill. The fruits—improperly termed seeds—of this plant are imported into this country in large quantities every year from the south of France. They have carminative properties, due to the presence of an essential oil, contained chiefly in the vittle of the pericarp. Dill-water, for instance is a well-known domestic remedy for flatulence. The fruits are used

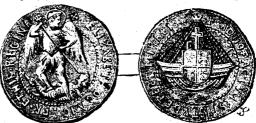

domestic remedy for naturence. The trutts are used in the manufacture of gin.

ANBUBISM, diffusion (Gr. aneurino, I widen or dilate), in Surg., is generally defined to be a pulsating tumour, containing blood, and communicating with the interior of an artery. It is a tumour formed by a preternatural dilatation of a part of an artery, or by the extravasation of arterial blood in the cellular members, accessed on the contract of a resulting or want of the brane, in consequence of a rupture or wound of the brane, in consequence of a rupture or wound of me coats of an artery. The former is termed true, the latter false or spurious aneurism. If the external membrane of an artery is injured, and the internal protrudes through it and forms a sac, it is called a mixed aneurism. Aneurisms arise partly from too weakness in the membranes of the artery. They are most frequent in the adult, between the ages of 30 and 50, and occur oftener in the mule than in the female; but no age is wholly exempt from them. They may be met with in any part of the body, and are usually divided into external and internal; the former occur-

# Angel-Fish

ring on the limbs, neck, or external part of the head; the latter form in any of the cavities of the body, as the thorax or abdomen, and generally affect the aorts or some of its principal branches. In the early stage of aneurism, if external, a small pulsating tumour is observed, which entirely disappears when compressed, the latter form in any of the cavities of the body, as the observed, which entered mappeass when compressed, but returns as soon as the pressure is removed. It continues to grow larger, and as it increases in size its pulsations become weaker, partly on account of its greater distance from the course of the blood, and greater distance from the course of the blood, and sometimes also from the accumulation of fibrine within the cyst. Sometimes this fibrine consolidates, and becomes connected with the walls of the cavity, which it at length fills up, occasionally bulging into and choking up the artery. This, however, is a termination of aneurism that is unfortunately rare. In most cases, the dilatation of the sac goes on until, if not arrested, the inclosing membranes give way, and the patient expires from loss of blood; or death may be produced by pressure upon important parts, as the trachea, assophagus, nerves, &c. The cure of aneurism consists in applying a ligature to the artery above the tumour: the ingress of blood into the sac is thus pretumour: the ingress of blood into the sac is thus pretumour: the ingress of 1000 into 108 act is tuns pre-vented, and its contents are gradually absorbed. The blood, being interrupted it its course through the artery, passes with greater force into the collateral branches, permanently enlarging them; and thus the necessary circulation to the parts beyond the obstruction is carried on. Internal aneurisms not admitting of such treatment, recourse must be had to such means as moderate the action of the heart, and depress the general circulation, thus inducing the formation of fibriue within the sac, which may gradually fill it up. These consist of repeated bleedings, low diet, perfect rest, and the administration of gentle laxatives and medicines which moderate the action of the heart; as digitalis, &c.

Angel, nin'-jel, an ancient gold coin in England, which was so named because it bore upon its obverse the figure of the archangel Michael piercing a dragou. It appears to have been first coined in France, about 1340. In 1465 Edward IV. introduced it into England,

ARGEL.

where it continued to be coined until the close of the reign of Charles I. Its value differed in different

reign of Charles I. Its value differed in different reigns, but is now only an imaginary sum, or money of account, implying ten shillings.

ANGEL, a term which is derived from the Greek aggeles, signifying an envoy or messenger. It is thus properly the name of an office, without reference to the person employed; and hence human beings, as prophets, priests, &c., are sometimes called angels. The Jews, however, and after them the Christians, have regarded angels as a class of intelligence superior to man employed in carrying out the gences superior to man, employed in carrying out the gences superior to man, employed in carrying out the Divine commands. They have on several occasions revealed themselves to man. Before the captivity of Babylon, no angel is mentioned by name. After that time the names of Raphael, Gabriel, and Michael, occurin Scripture. The Jews divided them into different classes and ranks; and Dionysius the Arcopagite, in his Heavenly Hierarchy, divides them into three classes, each containing as many orders. Most hold that angels were created before the visible world; others, on one of the six days; for, even on what day it took place, they are not agreed. Swedenborg gives a classification

and detailed account of angels.

Angels-Fren (Squatina Angelus).—This curious fish, which is common on the British coasts, derives its

# Angelic Acid

name of angel-fish from its pectoral fins having some resemblance to wings. It is remarkably ugly, having a large head and capacious mouth, set with five rows of teeth, which are broad at the base, and sharp and pointed above. Like the rest of the shark tribe, these teeth, by the aid of muscles, are capable of being raised and depressed. It has small eyes, set in a crescent-shaped orifice. The back is very rough, and of a grey colour; the belly is white and smooth. It is an extremely voracious fish; and, lying at the bottom of the water, preys upon the smaller fishs which abound there. It measures about eight feet in length, and weighs about a hundred pounds. Formerly its flesh was considered a delicacy; but modern epicures pronounce it coarse and unpalatable. The skin of this fish is used by cabiand unpalarance. The sam of this non-sequence of meters for polishing purposes, and is also made into a fine kind of shagreen. The peculiar structure of the peculiar structure of the peculiar structure of the peculiar structure. this fish has gained for it two other names, by which it is frequently known. By some it is called the monkfish, because its head appears to be enshrouded in a The term fiddler-fish has also been given it, although its shape bears little resemblance to that musical instrument. A species (Squatina aculeata), which has a row of spines along the back, is found in the Mediterranean.

Arkelle Acin, an'-jel'-ik.—This neid is met with in the roots of the different species of angelica. From the possibility of distilling it, and from its high fusing-point, it is supposed to belong to the oleic series.

ANGELICA, in Bot. (See ARCHAN ANGELICA TREE. (See ARALIA.) (See ARCHANGELICA.)

Angeliei, or Angelics, an jel-iks, an ancient sect of hereties, supposed to have been so called from their worship of angels. The council of Laodicea denounced this error, stating that "Christians ought not to forsake the church of God, and go aside, and hold conventicles, to invoke or call upon the names of angels, which things are forbidden."

ANGELITES, an included a sect of heretics which existed in the reign of the emperor Anastasius, about 494, and were so called from Angelium, a place in the city of Alexandria, where they held their first meetings. They held that the persons of the Trinity are the same; that none of them exists of himself and of his own nature; but that there is a common God existing in them all; and that each is God by a participation of this deity.

ANGER, an'-ger, an emotion of the mind, occasioned by an injury done or offered to a person, or some one in whom he feels interested, and accompanied by a desire of revenge. Like the other mental passions, anger has its use and its abuse. "In morality, and in preserving the order of the world, resentment is a powerful instrument. Not merely the hurt that anger prompts to, but the very expression and aspect of the passion, inspire dread, and make men exert themselves to avoid causing it. Our anger is a wall of fire around us. In the government of human beings, the display of angry relings suffices very often to check disobedience."
(Bain's Emotions and Will.) The abuse of the passion is whon it is occasioned by trivial or insufficient causes, or when it is continued too long. "Let not the sun go down upon your wrath" is one of those particular of Senitration and the sun go. sayings of Scripture that contain volumes of philosophy. The proper government of this passion, which all should strive after, consists not in suppressing it, but in repressing that desire of revenge to which it rives rise. The effects of anger upon the physical system are very marked. The action of the heart is much increased, and the circulation of the blood is accelerated; the face becomes red and swollen, the brows knit, the eyes startle, and the whole body is in violent agitation. It frequently gives rise to diseases of the heart, brain, or other organs; but remarkable cures are also reported to have been effected by it, as ague, paralysis, cout, &c.

# Angler-Fish

to half an hour or more, and come on suddenly, at irregular intervals. They are often excited by violent exercise, strong mental emotion, or a derangement of the digestive organs; but frequently make their sp-pearance without any manifest exciting cause. It is met with chiefly in the middle-aged or old, and is more frequent in males than females. Physicians are by no means agreed as to the seat and nature of this disease, and dissection has shown almost every disease of the thoracic viscers in connection with it. It seems most probable, however, that it primitively arises from a disordered state of the nerves in connection with the lungs and heart, which produce organic changes in these organs, or in the large vessels communicating with them. It is the nature of this disease to proceed with them. It is the nature of this disease to proceed from bad to worse, until at last the patient expires during a paroxysm of more than usual severity or duration, or falls a victim to some of the many organic lesions of the heart with which it is so often attended. Where the patient is young, or of good constitution, and where there are no symptoms of organic affection, success frequently attends early, active, and judicious treatment. Violent exercise and strong mental emotions are the activity of the patient of the strong mental emotions are the activity of the patient of the strong mental emotions are the activity of the strong mental emotions are th tions are to be avoided, as well as long fasting or too tions are to be avoided, as wen as long lasting or too full meals, and sudden exposure to great heat or cold. In fact, the patient "must lead a sober, quiet, and temperate life, in which neither the emotions of the soul are to disturb the functions of the body, nor comporeal affections are allowed to disturb the serenty of the mind.'

Angiosperms, an'-je-o-sperms (Gr. aggeion, a vesse), sperma, seed), in Bot. flowering plants having their ovules or rudimentary seeds incased, or in ovaries. The ovules are fertilized indirectly by the action of the pollen on the stigmas. Plants with naked ovules are distinguished as Gymnosperms (see this word). In the system of classifi-

cation adopted by Professor Bentley, the great class of Dicatyledones are divided into angiospermous and gymnospermous plants.

BRUIT OF AN ANGIOSPERM.

nospermous plants. The first division, which is termed Angiospermia, is by far the more comprehensive, and embraces the sub-classes Thalmifura, Calyeiflora, Corollifora, and Monoclanydea. The second division, called Gymnospermia, forms a single sub-class. (See BOTANY, OVULE,

ANGLE, "ing-el (Lat. angulus, a corner), in Geom., the inclination of two lines meeting one another in a point. These lines are also called the "legs" of an It is not upon the length of these lines or legs, angle. It is not upon the length of these lines or legs, but upon the degree of their separation, that their definition depends. A pair of compasses will afford a practical illustration of different angles: half-way between shut and straight they exhibit a right angle; close them a little, and they contain an acute angle; open them a little, and they contain an obtuse angle. A right angle is an angle of 90 degrees. (See Guometra.)

Angler, ang'-ler, a term applied to one who fishes

with an angle, an instrument consisting of a rod, line,

and hook, by means of which fish are taken.

ANGLER-FISH (Lophius piscatorius).—The angler-fish is known also as the sea-devil, fishing-frog, and toadfish. Judging from its appearance, the name fishing-frog would seem to be the more correct appellation, frog would seem to be the more correct appellation, as it more resembles a gigantic tadpole than anything else, and a very ugly tadpole to boot, as it is, almost without exception, the most ungainly-looking fish in creation. Its head, which forms quite half of its body, is flattened on the top, and the mouth extends nearly the whole width of the head, on the top of which are placed, pretty closely together, its two large black eyes. The nostrils have no external orifice, but two internal ones, answering the same purpose. The lower jaw of the angler is considerably longer than the upper; both are provided with rows of sharp conical teeth. The upper parts of the body are of a brown colour, the lower parts white. The pectoral and ventral fins are of the same colour, and the tail is nearly black. The angler, being a voracious fish, and at the same time far from an industrious one, is compelled to resort to artifice to obtain a living, and the paralysis, gout, &c.

ANGINA PROTORIS, &n-ji'-nā pek'-to-ris, literally signifies a contraction or tightening of the chest, and in Med, is the name of a disease of the chest, characterized by a feeling of painful constriction at the lower part of the sternum or breasthone, inclining to the representation of the left arm. The pain is very acute, accompanied with a difficulty of breathing irregular action of the heart, and a feeling of approaching dissolution. The pararysms last from a few minutes produced to resort to artiflee to obtain a living, and the many content of the same time far from an industrious one, is compelled to resort to artiflee to obtain a living, and the many content of the same time far from an industrious one, is compelled to resort to artiflee to obtain a living, and the many content of the same time far from an industrious one, is compelled to resort to artiflee to obtain a living, and the many content of the same time far from an industrious one, is compelled to resort to artiflee to obtain a living, and the many content of the same time far from an industrious one, is compelled to resort to artifle to obtain a living.

# Angling

modus operandi is somewhat singular. Affixed to the front of its head are two bony filaments, the foremost one dilated at the tip, and having a silvery lustre. Firstly, Lophius piscatorius settles itself comfortably

ANGLER-FISH.

at the bottom of the water, and, shaking up the mud or sand a bit, makes the water somewhat turbid. Having thus hid its ugly person from the gaze of squeamish fish, who might take an objection to its appearance, and hence keep clear of its locality, it hazily flutters the appendage aforesaid to and fro in the water. The but easily takes, and small fish, who imagine they are about to make a meal of the little shining worm find themselves, in a twinkling, in the capacious jaws of the angler. Not always, however, does it obtain its food in the manner described; but sometimes exhibits a boldness which certainly seems more in unison with its bloodthirsty appearance. Mr. Yarrell relates two such instances. In one case, a cod had been hooked by a fisherman, and on being drawn to the surface, he by a fisherman, and on being drawn to the surface, he was astonished at finding an angler hanging to it. So tenacious did it keep its grip on the cod, that he was compelled to strike it a severe blow before it would quit its held. Another time, an angler had seized a conger eel, and the latter had wriggled itself into the bronchial aperture of its captor. In this condition, they were both brought to the surface. The average size of the angler is about three feet, although it has been known to attain a length of five feet. In itself, the fish is of no value, but morned the time found. the fish is of no value; but many of the fish found in its stomach are generally quite uniquired, sometimes alive; and the fishermen frequently make n little money by exhibiting the fish itself to seasile visitors, generally accompanying their exhibition with a most doleful lamentation upon the ravages committed by doleful lamentation upon the ravages communes of their not very prepossessing captive. Closely allied to the foregoing species are several others:—1. The Cornish angler (Lophius cornabicus); 2. the muricated angler (Lophius mixicatus); 3. the beaked angler (Lophius rostratus); 4. the harlequin angler (Lophius strictus); 5. the striped angler (Lophius strictus); 6. the marked and and or (Lophius margaratus).—Ref.

the marbled angler (Lophins marnoratus); o. Ref. Dallas's Hist, of Animal Kingdom.

Arcting, ingt-ling, the occupation of a fisherman, particularly applied to the art of taking fish in freeh particularly applied to the art of taking use in fresh water, rivers, ponds, and brooks, with a rod, line, and book, to which is attached a natural or artificial bait or line. There are two methods of angling,—fly-flshing and bait-flshing. The former is chiefly practised during the summer months, when insects are most plentiful, by those who are really fond of a sport requiring by those who are reany ionu of a sport requiring considerable skill, and affording no small degree of excitement, and angle for salmon and trout, and those fish which are usually found in rapid rivers and swiftrunning streams. Bait-fishing is generally followed in deep sluggish rivers and large pond-like pieces of water, which are-frequented by perch, roach, carp, pike, dace, tench, gudgeon, &c. The necessary fishing-tackle for an anglor comprises a red and reel, lines, hooks, silkworm gut, and artificial flies; a fishing or tackle book especially, for the reception and preservation of these articles when not in use; baits of various kinds, boxes, floats, and a basket. The most useful rod is sen fitted with different top-joints, which will serve for the purposes of throwing a fly, dibbing or dapping with a worm, foruweb, bluebettle-fly, or grass-hopper, or trolling with a minnow or stickloback. A salmon rod should be seventeen or eighteen feet long, stout, strong, and tolerably stif; for trout, a shorter, lighter, and more elastic rod should be used. The running streams. Bait-fishing is generally followed in

# Anglo-Catholic

most convenient rod is made in pieces, about three feet or more in length, fitted together with joints, with a spear screwed into the bottom of the butt or stock of the rod, which should be hollow, to hold extra topof the rod, which should be hollow, to hold extra top-joints. The reel commonly used is a small brass multi-plying one, which may be attached to the rod at pleasure, by rings sliding on the butt, allowing the angler to wind or unwind his line with greater rapidity and without check. The best line for general purposes is made of hair; but, for trolling, a silk line-is preferable. It should be white, or of a reddish colour, for clear streams; and grey, or black and is preferable. It should be white, or of a reddishcolour, for clear streams; and grey, or black and
white, for deep and muddy water. A line should be
about thirty or forty yards in length, and taper from
the end attacked to the red. The best are woven or
plaited togother in one piece, and thus are free from
knots, which prevent the line from running freely
through the rings attached to the rod. A collar of
silkworm gut, consisting of many strands firmly knotted
tagether; is attacked to the and of the line for ilvtogether, is attached to the end of the line for flydishing, to which are fastened the artificial flies best suited for the season or the fish the angler desires to take. Hooks are made of various sizes, numbered suited for the season of the first one anger desires, the take. Hooks are made of various sizes, numbered from 1 to 13, ranging from some inches in length to half an inch, or even less. The best are manufactured at Redditch. Floats are made of cork or quilt, heavier at one end than the other, to remain upright in the water. The basket is peculiar in shupe, large at the bottom, and smaller at the top; hollowed behind, to rest with comfort on the angler's back, and suspended across the chest and shoulder by a strap of leather. In addition to these, a gaff and landing-net leather. In addition to these, a gaff and landing-net are sometimes carried, to secure fish of some weight when they have been brought into shallow water. The natural baits commonly used by anglers are gentles, which are the larva of the common blowfly; the larva which are the larva of the common bloodly; the larva of the phrypaneae, called eadily or caddice-worms; the common earth-worm, found in gardens and grassically and the larva of the gaddy, found under cow-dung; caterpillars of various kinds, and different pastes or compositions which arraconsistant to be fitted. sitions, which are now considered to be of little use. These are baits for ground fishing, and must be sunk to touch the bottom, or nearly so; for which purpose split shot are attached to the gut-line, a little above the hook. Artificial flies are made from the nackles of fowls and the feathers of various birds, coloured wool, the flax of the hare and rubbit, and the fur of mice and other animals. These materials are neatly field to the shank of the nook with silk, to present some tied to the shank of the hook with sur, to present some resemblance to the insect it is intended to imitate. Among the most common are the red palmer-fly, the blue dually, the brown fly or duadrake, the saider-fly said the green drake or May-fly. For spider-fly, not the green drake or May-fly. For salmon-fishing, large flies are required, made of brilli-ant and gaudy materials.—With the description of the various fish that frequent the rivers and lakes of the United Kingdom, Norway, Canada, and other countries, information will be found respecting the locations and sensons in which they may be taken, and the buils best suited for the purpose. (See Salmon, Trour, Pike, &c.)—Ref. Izaak Walton's Complete Angler; Stoddart's Angler's Companion; Colquboun's Moor and Loch; Stewart's Practical Angler.

Loch; Stewart's Practical Angler.

Anglo-Catholic or Anglacan Chunch, ingl-li-kan, a tern cuployed to designate those churches which embraced the principles of the Established Church of England. It includes the United Church of England and Ireland, the Episcopal Church in Scotland, the Colonial Episcopal churches, and the American Episcopal Church. When and by whom Christianity was introduced into Eucland. Christianity was introduced into England is not secer-tained; but, according to some, it was in the time of the Apostles or their immediate successors. When the Apostles or their immediate successors. When the Britons were conquered by the Anglo-Saxons, who were heathens, the Church was persecuted, and its adherents driven into Wales, or reduced to a state of slavery. St. Augustine was, about the year 50%, sont by Pope Gregory I., along with some forty others, into Britain, in order to convert the Anglo-Saxons. When Christianity began to spread among the Saxons, the conversion of the king of a Saxon state was immediately followed by the elevation of his benefactor to a bishopric, the limits of which were usually contermibishopric, the limits of which were usually conterminous with those of his kingdom. Subsequently, some

Angora Wool

of the larger dioceses were divided, and new bishopries created; and, with the exception of some changes effected in the reign of Henry VIII., and a few of recent origin, the present bishoprics are the same as those catablished in Auglo-Saxon times. At first, the Church in England existed in a state of comparative freedon and purity; but gradually, and at length completely, she became assimilated in doctrine and practice to the Church of Rome, and subject to her domination. From the time of Wyolifie to the reign domination. From the time of Wycliffe to the reign of Henry VIII., nearly every parliament adopted measures to resist pontifical supremacy; and they even measures to resist pontineal supremacy; and they even several times suggested to the soverengt the appropriation of church property to secular objects. From 1534 England may be said to have possessed a national church; for ever since, except during the brief reign of Mary, the civil laws by which Christianity has been established and expounded have derived their force established and expounded have derived their force entirely from the sanction of the government of the state. In 1536 the Convocation passed, and the king adopted, certain articles, in which the Bible and the three Creeds are set forth as the foundation of belief; baptism, penance, confession, and belief in the corporal presence, are declared essential to salvation; and jus-tification is said to be obtained by the union of good works with faith. Images were to be used as examples, not as idols; saints were to be honoured, not worshipped; the use of holy water was allowed, but worshipped; the use of holy water was anowed, our its efficacy denied; indefinite prayer was permitted for the dead; and the existence of an unspecific purgatory was affirmed. In the following year the king put forth a fuller exposition of belief, in a book adopted by the Convocation, and entitled "The Institution of a Christian Man." In 1539 the law of the Six Articles was passed; these were-1. The doctrine of the Real Presence; 2. the communion in one kind only; 3. the perpetual obligation of vows of chastir; 4. the utility of private masses; 5. celibacy of the clergy; 6. the necessity of auricular confession. Death by fire and the forfeiture of all possessions were the penalties enacted for controverting the first article, and imprisonment or death for the rest; but in 1544 these penalties were somewhat modified though the numbers that suffered death under them were still very great. During the brief reign of Edward VI, the doctrines During the brief reign of Edward VI. the doctrines of the Reformation made rapid progress; the law of the Six Articles was repealed; the celebration of private masses was prohibited; the laity were allowed the communion of the cup; marriage was permitted to the clergy; images were removed from the churches; allars were converted to communion-tables; and, finally, in 1553, the Forty-two Articles were issued, catablishing the destricted of the Characteristic than the establishing the doctrines of the Charch nearly as they stand at present. A new communion service, differing but slightly from that now in use, was produced in 1547, and in 1540 the English Liturgy was first introduced, and, after being revised and somewhat altered, was confirmed by parliament in 1552. During the short reign of Mary, Romanism was re-established, and about 1500 paragraft of the incremental their contents of the short reign of Mary, Romanism was re-established. short reign of Mary, Romanism was re-established, and about 300 persons paid for their opinions with their lives. On the accession of Elizabeth, Protestantism was restored. In 1559 the Act of Uniformity re-established, with little variation, the Book of Common Prayer; and in 1571 the Articles of Religion were adopted in their present form, and confirmed by act of parliament. (See ARTICLES, TRIETY-NINE.) The doctrines of the Church of England are embodied in her Articles and Litturgy (which see); the Book of her Articles and Liturgy (which see); the Book of Common Prayer prescribes her mode of worship; and the Canons of 1603 contain, so far as the clergy are con-cerned, her code of discipline.—Ref. Religious Census of England and Wales in 1851, by Horace Mann.

Anglomania, ang'-lo-mai'-ni-a, a term used in France and Germany to denote a desire to adopt, or an admiration for, the manners, customs, institutions, &c., of England. "We have less reason," says the &c., of England. We have less reason, suys one German Conversations Lexicon, "to complain of the German Anglomania of the present day, than we had of the Gallomania of a former period."

ANGLO-SAXON ARCHITECTURE. (See ARCHITECTURE, Anglo-Saxon.)

from the North of Germany that arrived in England at intervals from 449 to 547, under Hengist and Horse, and numerous other chiefs, and gradually subjugated the greater part of the country, founding the Saxon heptarchy. The Saxons are supposed to have colonized the south-eastern coast long before this period, and, if this be the case, it is probable that the frequent inter-course of the German tribes with these settlements led them to conceive the idea of taking possession of the entire country after the departure of the Romans. The Jutes first, coming from Schleswig, made themselves masters of Kent, part of Hampalare, and the Isle of Wight; the Saxons, shortly after, took the central and remaining southern parts of England; while the Angles, arriving in bands in 527 and subsequent years, settled in Norfolk and Suffolk, the country north of the Humber, and the lowlands of Scotland. These invaders, in the eighth century, divided the territory that they had gradually wrested from the Britons into seven states, known as the Heptrerby, and formed a federal lesgue for mutual protection against foes from without, under a leader to whom the title of Bretwalda was given. (See BERTWALDA.) These states were united in 827, by Egbert, king of Wessex, who thus became king of England, or the land of the An The Anglo-Saxons were the dominant power in Eng-land from 449 to the Norman conquest in 1986, except during the short time the country was under Danish rule, from 1017 to 1042. They were converted to Christianity by Augustine, who was sent to England as a missionary in 596, by Pope Gregory I. The laws and customs of the Anglo-Saxons were derived from their German ancestors; but these were modified and improved by Alfred the Great, who laid the foundation improved by Alfred the Great, who laid the foundation of the unrivalled constitution of this country. The exping, or king, was the first person in the state; his office was at first elective, but afterwards became hereditary, though subject, in a great measure, to the will of the people. The king was assisted in the government by an assembly called the Witenagemote (see Withmagemote), composed of the leading men the kingdom among the nobles and elevery and on the kingdom among the nobles and clergy; and, without the consent of this body, the king could not lavy taxes, or commence or end any war. The next in rank to the king and athelings, or persons related by blood to the sovereign, were the caldormen, or aldormen, men possessed of great power and influence in civil and military affairs, who governed large tracts of land, or shires, as licutenants of the king. The thanca, or inferior nobles, held a position in the social scale between these and the ordinary mass of the people, who were termed ceoris: these were free men The slaves, or theows, sometimes called thralls, formed a still lower class, and belonged to the holder of the land on which they were born, and from which they never moved, the transfer of an estate from one possessor to another necessitating the purchase of the slaves. Composition was made for homicide and theft, and crimes of all kinds, by payments in money or cattle, the amount all kinds, by payments in money or cattle, the almost of remuneration in all cases being regulated by the station in life of the man to whom the wrong had been done. The kingdom was politically divided into districts called shires; each shire into hundreds, and each hundred into tithings, ten in number, the tithing containing ten families, the members of which were mutually bound for each other's good conduct and there is not the large spiritually and the large spiritually conduct and the same of the large spiritually cases while series of the large spiritually cases and the same of naturally bound for each other's good conduct and observance of the laws. Seirgemotes, or assemblies of the leading men in each shire, under the eadforman, were held half-yearly.—Ref. Sharon Turner's History of the Anglo-Surons; Kemble's Suzons in England; Knight's Popular History of England.

ANGORA CAT. (Soc CAT.)

ANGORA GOAT, ân-gor'-d, a beautiful animal, native of Angora, a mountainous city in Asia Minor. These costs have fine self silve hair onlie city in these in

goats have fine, soft, silky hair, quite eight inches in length. From this goat-hair a sort of yarn, called camel-yarn and Turkish yarn, is made. The term camel is often erroneously supposed to be derived from the name of that animal; it comes, however, from the Arab. chamal, tine. The skin of the Angora goat also yields that fine kind of leather known as oriental

ANGLO-SAXONS, un'-glo sur'-ons, the general historic fine cloths, shawls, &c. The wool is derived from the name given to the Angles, Jutes, and Saxons, tribes long-haired goat of Angora, the Cashmere goat (Capra 75)

# Angreecum

lanigeral, and the shawl-goat of Thibet (Changra). Lieut. Connolly thus describes the animal and its habitat.—"Take Angora as a centre, then Kizzil Ermah (or Huly's) Comgere, and from eight to ten hours' march (say thirty miles) beyond Bebezzar, and the march (say thirty miles) beyond Bebezzar, and the same distance beyond, to near Nalaban,—from the whole of this tract the common bristly goat is ex-cluded, and the white-haired goat alono is found. The fleece of the white Augora goat is called tiffik (the Turkish for goat's hair), in distinction to you or yapak, sheep's wool. After the goats have completed their first year they are clipped annually in April or May, and yield progressively until they attain full growth. and yield progressively, until they attain full growth, from 150 drachms to 1½ oke of tiftik (from 1 to 4 lb. English)." The raw hair of the gont is exported to France and England, both woven into the beautiful fabrics bearing the name of Engora, and in the rough state as yarn. It is the raw material which comes principally to England and France, the woven febric with the transfer of the transfe fabric being chiefly retained in Turkey. In 1820, the year when the first specimen of this product arrived in England from Constantinople, so little was the wool appreciated, that it fetched in the market only 10d. per pound. Mr. Southey, in his work upon Colonial Sheep and Wools, informs us that "within the last few years a new texture made of goat's wool has been introduced both into France and this country, which calls for particular attention. The texture consists of stripes and checks, expressly manufactured for ladies' dresses, and having a soft feel and silky appearance. The wool of which this article is made is chiefly the wool of the Angora goat. This wool reaches us through the Mediterranean, and is chiefly shipped at Smyrna and Constructionals. In adopt it is the white the terms and Constantinople. In colour it is the whitest known in the trade, and now more generally used in the manufacture of fine goods than any other. There are, however, other parts of Asiatic Turkey from which limited supplies are received, but in quality not so good as that produced in Angora. After the manu-facture of shawls with goats' wool declined in France, this raw material remained neglected for a long while About the year 1852, however, the French another attempt, and brought out a texture for ladies' dresses in checks and stripes, which they call poil de chèvre. The warp is a fine-spungsilk coloured, and the energe. The warp is a mne-spungenk coloured, and the west Angora or Syria white wool, which was then thrown on the surface. This article has a soft feel and looks pretty, but in weaving is apt to cut. The price of a dress of French manufacture has been from £2. 10s. to £3, but, by adopting a cotton warp, the same article is now made in England and sold for 15s.; and it is found that the cotton warp, as a mixture, suits the goats' huar best." The wool is manufactured chiefly at Bradford and Norwich, and some of it in Scotland. In France it is spun in Paris, Montataire, and elsewhere. In 1848 the quantity of goats' wool imported into this country was 896,865 lb.; in 1863 it reached 3,434,705 lb., which, taken at the average value of nearly 2s. 11d. per lb., gives the total of \$502,728. In England it is manufactured into light cloth for overcoats, for plush, and for coach-lace, &c. In France it is manufactured into shawls, in value varying from £4 to £16 each. A lace is likewise made from it, which can be sold at half the price of the costly Chantilly and Valenciennes lace.—Ref. Urc's Diet. of Arts, Manufactures, and Mines.

ANGRECUM, an gret-kam, in Rot., a gen. of plants belonging to the nat. ord. Orchidacca, the Orchis family. The dried leaves of the species A. fragrans family. The dried leaves of the species A. fragrans form Faham or Bourbon tea, used in the Mauritius for making a beverage somewhat resembling the infusion of ordinary Chinese tea.

ANGUILLA. (See EBL.)

Anguinum Ovum, ön-gwi'-num o'-vum (Lat., adder-stone), the adder-stone, supposed to be made by the saliva of a cluster of serpents, and possessed of magical virtue. The superstition was prevalent among the ancient Britons, and is still faintly preserved amongst the Welsh peasantry. It was a glass bead used by the Druids, who pretended that the possessor should be fortunate in all his undertakings. The test of its genuineness was to enchase it with gold and throw it into the river. If it was genuine, it would swim against the stream.

Anguis. (See Blind-worm.)

# Anhydrous

ANGUSTURA BARK, OF CUSPARIA BARK, dn-gus-tu'-ra, a valuable drug, imported directly or indirectly from South America. In small doses it acts as a stimulant. tonic, and febriage; while, in large doses, it is somewhat emetic and purgative. This bark is the produce tonic, and februage; while, in large doses, it is somewhat emetic and purgative. This bark is the produce of different species of Galipea (which see), and its characteristic proporties depend on the presence of an active principle, to which the name Cuspaviu has been given. It has fallen into disrepute on the continent, in consequence of the substitution for it of a very poisonous bark obtained from the Strychnas naxromica. At one time the substitution was so common, that the importation of Angustura bark into Austria was prohibited, and the whole of it then found was ordered to be destroyed. At the present time such has

ordered to be destroyed. At the present time such a substitution is happily very rare, though it was detected a few years since in Dublin.

ANHINGA. (See DARTER.)

ANHINGALOR, ön'-hi-dride (Gr. a, without, and ador, water), a term applied to an anhydrous acid by the followers of Gerhardt's theory of chemical proposed there are a linear transfer and the second of t nomenclature, according to which all oxy-acids are supposed to ensist of their respective anhydrides, plus an equivalent of water. Thus nitrie acid is supposed to be NO, + HO, or HNO, NO, being adrice anhydride. This view is borne out by the fact, that the various ambydrides, both organic and inorganic, are destitute of any acid reaction. Some are even capable of being dissolved in water without showing any of the characteristics of an acid. Salts, according to this view, are formed by the substitution of an atom of metal for an atom of hydrogen in the acid. Thus, nitrate of potassium, as it would be called according to this theory, would be KNO, or nitric acid with an atom of hydrogen replaced by an nitric acid with an atom of hydrogen replaced or an atom of potassium. In like manner, sulphate of potash would be KSO, sulphuric acid HSO, and sulphuric anhydride SO. The theory is carried out in wonderful perfection throughout the series of organic acids: in fact, it was in investigating these that the theory was first conceived. Organic anhydrides bear the same relations to their acids that ethers bear to alcohols; that is to say, they differ by one equivalent of water. Acetic anhydride is formed by distilling anhydrous acetato of potash and oxychloride of phosphorus. It is a colourless mobile liquid, with a smell resembling, but still different from, that of acetic acid. On being thrown into water, it falls to the bottom in oily drops, which slowly dissolve, forming acetic acid. The annydride theory has been somewhat dwelt upon in consequence of Gerhardt's system growing daily more and more into use through the teaching of Hofmann, Prodic, Williamson, Odling, and other eminent chemists.

ANUXDRITE, in-hi'-drite (Gr. a, without, and udor, water), a mineral which consists of anhydrous sulphate of calcium. It has been variously denominated muriacite, tripe-stone, and anhydrite, according to its structure. Vulpinite is a siliceous variety, containing 8 per cent. of silex and having the bardness 3.5 (ac-cording to Dana's system of mineralogy). Crystal-lized anhydrite occurs in the salt-mines of Bex, in Switzerland, and at Salzburg, near Hall, in the Tyrol; also at Sulz, on the Necker, in Wintemberg; at Bleiberg, in Carinthia; at Luneberg, in Hanover; at Kapnik, in Hungary; at Ischl, in Upper Austria; and at Berchtesgarden, in Bavaria. The variety which bears the name of tripe-stone has been found principally at Wieliczka, in Poland. The vulpinite from Vulpino, in Italy, admits of being cut and polished for ornamental purposes. At Lockport, in the State of New York, it occurs of a fine blue colour in geodes of black limestone, accompanied with crystals of calcarcous spar and gypsum. Switzerland, and at Salzburg, near Hall, in the Tyrol;

in goodes of black limestone, accompanied with crystals of calcarcous spar and gypsum.

ANHYDROUS, ān-li'-drus.—Oxides and salts containing no water are said to be anhydrous. Water possesses the property of forming compounds called hydrates, with different salts and oxides. Thus we have hydrate of potassa, of lime, of oxide of chromium, &c. The sffinity possessed by many metallic oxides for water is so strong, that, when once the hydrate is formed, the water cannot be separated but by the addition of an acid. Caustic potassa, for instance, contains one atom of water which is not separated even by a red heat. (See Water.)

#### Anilic Acid

ANLIC ACID, än-v-lik.—Called also indigolic acid, on account of its being produced by the action of diluted nitric acid upon indigo. Carbonic acid is produced with it and remains in solution, the anilic acid separating it in light yellowish prisms, which are fusible and volatile. Anilio acid decomposes acetate of lead, forming with the lead 2 crystallized anilate.

ANILINE, an'-i-leen (Hindostance anil, indigo), Kx-ANTINN, an anterest (ninoseance ant, nongo), axanol, Phenylaming, Phenylat, or Chrystalline.
This compound, discovered as a product of the distillation of indigo by Unversorben, has of late received
great attention, from being the source of most of the
coal-tar series of dyes, of which mauve and magenta are familiar examples. Aniline, C.<sub>13</sub>H., N, is seelear transparent liquid, with an agreeable wine-like odour and a burning taste. It is very acrid and poisonous. It boils at 360° F. and freezes at 4° F. It is rather heavier than water, in which it readily dissolves. organic base, forming well-defined crystallizable salts with acids. It may be procured in several ways:—1. By acting on indigo with hydrate of potassa, and distilling the product. 2. It is contained in small quanti-ties in the products of the distillation of coal. 3. Nitrobenzols is converted into aniline and water by the action of acetic acid and iron, or some other deoxidizing agent. Aniline is very interesting from a chemical as well as a commercial point of view, the investigation of its properties having thrown great light upon many mysteries of organic chemistry. A short time since aniline existed only in a few laboratories in small quanthies; now it is manufactured in tons for the purpose of being converted into the various dyes. Watts, in his new Dictionary of Chemistry, thus describes its properties, according to the latest researches of chemists both in this country and upon the Continent: "Aniline is a non-conductor of electricity. Its vapour burns with a bright, but smoky flame. It exerts a burns with a bright, but smoky flame. deleterious action on the animal organism: half a gramme, with one and a half gramme of water, and sprinkled into the mouth of a rabbit, produced strong cramps, then laborious breathing, loss of strength, dilated pupils, and inflammation of the mucous mem-hrane of the mouth. Aniline disselves in all prebrane of the mouth. Aniline dissolves in all proportions in ether, alcohol, wood-spirit, acctone, sulphide of carbon, and oils, both fixed and volatile.

The aqueous solution has an extremely weak alkaline reaction, affecting only the most delicate test-papers; it does not blue reddened litmus or redden turmeric. but it changes the violet colour of dahlias to green. Aniline dissolves sulphur abundantly, also phosphorus, camphor, and colophony; but not arsenic, copal, or caoutchone. It produces a bright violet-blue colour with chloride of lime and other hydrochlorites, blue with sulphuric acid and acid chromate of potassium, and reds of various depth and brightness when heated with tetrachloride of carbon, stannic chloride, arsenic acid, fuming nitric acid, mercuric nitrate, and some acid, furning intre acid, mercuric intrace, and some other salts. It imparts a deep yellow colour to pine-wood and elder pith,—a character, however, likewise exhibited, though in a less degree, by other bases, namely, onine, cinnamine, leucoline, and naphthyla-mine. The squeous solution of aniline precipitates the bases from ferrous, ferric, zinc, and aluminium salts. With platinic and palladious chlorides it forms yellow double salts; with chloride of gold, a red-brown double salt; with murcuric, antimonic, and stannic chlorides, white double salts."

ANILINE DYRS .- The principal aniline dyes, or coalardyes, as they are often called, are manye, or Perkin's purple, magenta, red, or fuchsine, violine, and several others. Andline purple was discovered by Mr. W. H. Perkin, while endeavouring to form artificial quinine. On treating sulphate of aniline with bichromate of On treating supposes of annue with decironate or potash, he obtained a dense black precipitate, which, on further examination, was found to contain the purple in question in large quantities. This laid the foundation of the property of the latest the process of the latest the latest the latest the process of the latest the late dation for further researches, the result of which has white, yolk, and shell, into the flesh, blood, bones, and been the discovery of a series of the most eplendid dyes, constant in colour and brilliant in tint. Their commercial manufacture is briefly as follows:—Benton, direction, direction, direction. The principal chemical substances necessary for the support of the distinction functions of the animal system, are combined to form mitro-benzole, which, being acted on by acetate of iron, is resolved into aniline, water, and other compounds. Solutions of aniline water, and other compounds. Solutions of aniline water, and other compounds. Solutions of metals iron, solution, potassium, line, and magnulphate of aniline and bichromate of potash are dution for further researches, the result of which has

# Animal Chemistry

mixed and allowed to stand until the precipitation of the black powder mentioned above is complete. The precipitate is thrown on a filter and washed. It is then digested in coal-tar naphtha, and afterwards in alcohol, which dissolves out the dye. Violine is formed nearly in a similar manner, by means of the combined action of sulphuric acid and oxide of lead. By combining sulphate of aniline and oxide of lead, roscine is formed. Buppase of smaller and oxide of read, roseine is formed. By substituting bichloride of tin, or nitrate of mercury, fuchsine, or magenta, is obtained. "Bleu de Paris" is made by altering the proportions of bichloride of tin, and performing the operation is a closed tube heated for thirty hours to about 400° P. It was long known to chemists that aniline compounds were capable of yielding coloured products with chloride of capable of Treating concurred products of Perkin who first succeeded in making the production of aniline dyes a commercial manufacture. The manufacture of aniline commercial manufacture. The manufacture of aniline colours in England is rapidly developing into a most important branch of commerce, and from the facility and cheapness with which coal products are obtained, there is but little doubt that we shall shortly become the colour-exporting nation of the world, instead of having to rely on Turkey and Holland for madders and other dye-stuffe.

ANILINE TEST .- A method of using aniline as a means of ascertaining whether or not the linen in any fabric is mixed with cotton, and, if so, in what pro-portion, has been made known-by Herr Böttger. At the corners of one end of a strip to be tested he loosens the threads, so as to expose both the warp and the woof. He then dips that end of the strip in an alcoholic solution of aniline red, washes it in water until the washings are colourless, and then places it in an aqueous solution of ammonia. Should any cotton be present, the ammonia will discharge the colour t without touching the colour of the linen por-The linen threads will remain of a bright rosetion. The linen threads will remain of a bright rose-red, but the cotton threads will become perfectly white—Ref. Michanics Mag., 1865. Chemisches Central Blatt, 1865.

ANILINE YELLOW .- Mr. Nicholson, whilst preparing aniline red, discovered, among other secondary products, aniline yellow, or chrysaniline, a very beautifut yellow colour. Dr. Hofmann, on examining the product, proved it to be a well-defined base. Aniline yellow is prepared in a very simple way. The residue from which the resultine has been extracted is submitted to a current of steam, when a quantity of the base passes into solution. This solution precipitates aniline yellow in the form of a nitrate. Aniline yellow and

its saits dye wools and silks a gorgoous golden-yellow tint. They have been used as printing inks, and found to be very permanent.— Ref. Watte's Dict. of Chemistry, Ure's Dict. of Arts, Mungfactures, and Mines, ANIMA MUNDI, and-i-mi mun'-di (Lat., son) of the world), in Phil., the name of a certain pure ethereal substance or spirit, held by some ancient philosophers to be diffused throughout nature, and to constitute the living principle of the world. This doctrine was held by the Stoics and Stratonicians, and is closely allied to pantheism. Plato and his followers believed in this anima mundi, but held that there was an infinitely pure and perfect being above it. Many philosophical and philosophico-religious sects have entertained the same opinion under different forms.

ANIMAL, an'-i-mail.—The law distinguishes animals into such as are domita and such as are fera natura, some being of a tame, and others of a wild disposition; the former consisting of such animals as we generally see tame, and are therefore seldom or never found wandering at large; and the latter of such as are

usually found at liberty.

ANIMAL CREMISTRY.—That branch of science which treats of the different changes going on in the living animal; such as the change of the egg, consisting of

## Animal Flower

form of food, and become distributed to the different parts of the body during the process of digestion and assimilation; as for example, the iron to the blood and bair, the lime and phosphorus to the nails and bones. If any of these substances are wanting, the system suffers, and they must be restored to the patient. For instance, rachitis, or rickets, in children is caused by the bone containing too little lime; and the best remedy therefore, in its earliest stage, is plenty of lime-water, or some other substance containing lime. The following analysis of different parts of the human system will be interesting, as showing the destination of these different substances :-

Bone.	HAIR.

The modern discoveries of animal chemistry have thrown great light upon the vital functions, and the laws governing them. The researches of Liebig and others have also tended to purge medicinal science of much of its rubbish, and prescriptions are now com-pounded by men knowing the chemical value of their ingredients. (See BLOOD, BONE, RESPIRATION, &c.)

Animal Flower, the gen Actinia. It bears some resemblance to a flower with a radiated disk; its tentacula are disposed in regular circles, tinged with a variety of beautiful bright colours, as the marigold, anemone, &c. (See Anemone, Sea.)

ANIMAL HEAT is that heat which is generated in the

bodies of living animals, by which they are enabled to maintain a certain temperature, independent of that of the atmosphere or other matinm by which they are surrounded. Heat is one of the conditions necessary to life, and, when that is reduced below a certain point, all vital activity ceases. The sun is the great source of heat, and on it vegetables and the greater number of tribes of animals principally depend. There are certain tribes of animals, however, especially birds and manuals, which possess the power of generating heat within themselves to such a degree as to render their vital functions almost entirely independent of external influences; and there is probably no species that can exercise this power more effectually and through a greater range of conditions than man. Judging merely from our sensations, we should be led to conclude that our bodies undergo very considerable changes of temperature. Such, however, has been proved not to be the case. From a series of 114 ob-servations made by Dr. John Davy on persons of different ages and sexes, and in various latitudes, it was found that the mean temperature of the body was 100°, in a mean atmospheric temperature of 74°; the highest temperature of the body being 102°, while the highest atmospheric temperature was 82°, and the nignest atmospheric temperature was 82°, and the lowest temperature of the body 98°.5°, while the lowest temperature of the individuals was 27°. In favourable circumstances, the temperature of infants is somewhat higher than therefore adults, but in the work of the somewhat higher than that of adults; but, in their power of resisting the depressing influence of external cold, the former are much inferior to the latter. External cold reduces the temperature of the body considerably, especially if at rest. Thus Dr. Davy found the temperature of his own body reduced, on an average of four observations, to 96.7°, with the average temperature of the surrounding air at 37°. An increase of temperature surrounding as at 37°. An increase of temperature takes piace after exercise, as well as after a meal. The usual temperature of the body occasionally undergoes considerable change in disease, from 106° in fever to 67° in cholera. The mean temperature of birds is rather higher than that of mammals, averaging about 108°,

# Animal Kingdom

while mammals average about 101°. Animal heat arises from the various changes that are constantly going on within the bodies of the animals. Every change that takes place in the condition of the organic components of the body, in which their elements enter into new combinations with oxygen, is necessarily a source of the development of heat. By the union of the oxygen of the atmosphere with the carbon and hydrogen of the body, a species of combustion takes place, and heat is evolved. Hence We find that the more rapidly this combustion is carried on, the greater the amount of heat medical and honce a precisic increases the from the various changes that are constantly going on of heat produced; and hence exercise increases the heat of the body. Some have held that combustion was not sufficient to account for the total amount of best generated in a living body; but the most retent authorities are now generally agreed that such is the case, especially when we take into account the small case, especially when we take into account the small quantities of sulphur and phosphorus which also undergo oxidation within the system. But, while a low degree of heat destroys vital activity, not less destructive to it is a high degree of heat. By a wise provision, therefore, the body has the power of maintaining itself in a moderate state of heat, even when surrounded by a very hot medium. Thus Banks, Blagden, and Fordyce exposed themselves to a heat of nearly 260°, and found that their bodies had preserved nearly their own temperature. This is owing to the cutaneous and pulmonary evaporation which takes place. Animals placed in a hot atmosphere so satu-rated with humidity that no evaporation could take place, could not support a heat but little greater than

their own without perishing.

ANIMAL KINGDOM.—This term is commonly applied to one of the three primary divisions of Nature, the other two being called respectively the Vegetable kingdom and the Mineral kingdom. All organized beings are included in the first and second, and all inorganic bodies in the third division, This arrangement of natural objects into three great departments is very ancient; indeed, there is every reason to believe that it was one of the earliest classifications devised by the human mind. The general differences between aninuman mind. The general differences between amula, plants, and minerals are so striking, that they could not long have escaped the attention of wondering and thoughtful man. With the increase of knowledge, however, the line of domarcation between the two organic kingdoms has gradually been obliterated; and at the present time we may seek in vana for a character by which an animal may at once be distinguished from a plant. The mineral kingdom can easily be defined, as no inorganic body has the characters which we may recognize it any organized being. A plant or an animal, however lowly, may be distinguished from a mineral by its cellular structure. All its parts originate in and are formed out of cells (rec Cells); and each part so produced is dependent on the others. A mineral had is among to the contract of the colors of the colors of the colors of the colors. mineral body is merely an aggregate of homogeneous particles, and it has no special parts or organs. Again, a plant or animal exists as an individual being for a certain time, and has the power of producing other beings to take its place when that time has expired. A neings to take its place when that the has expect. As mineral, on the other hand, has no definite period of existence, but will remain unchanged as long as it in not acted upon by external forces sufficiently powerful to overcome the cohesion of its particles. The distinction between plants and animals, though evident enough when we regard those which are highly organized, is scarcely perceptible when we compare the lowest links of each chain of life. Indeed, many unpretending forms of life seem to occupy neutral ground, and may be claimed by the botanist and zoologist with equal right. Aristotle was the first naturalist who south the distinct a hateralists. who sought a distinction between plants and animals; and, in stating that an animal possessed a animals; and, in stating that an animal possessed as mouth while a plant had no such organ, he gave, perhaps, the simplest and most generally applicable definition that exists. The microscope has, however, quite upset the notion that the mouth is a necessary part of an animal. Linneaus attempted to define the three kingdoms by the following dictum:—" Minerals grow; plants grow and live; animals grow, live, and feel." To apply this definition, we must first define life and feeling; and this cannot be done in such a way as to effect the object of the naturalist. Curier thought the possession of a stomach a sufficient distinction for

the possession of a stomach a sufficient distinction for

## Animal Kingdom

the animal kingdom; but, since his time, we have become acquainted with numerous microscopic creatures that have no special receptacles for food. Until very lately, chemical distinctions were much relied upon, as it was believed that the presence of cellulose (see this word) or of starch was a certain characteristic of a plant. This belief has, however, been proved to be erroneous by the discovery of these common vegetable constituents in the tissues of animals. Though we cannot give any absolute rule for distinguishing an animal from a plant, we can point to many striking differences between the two kingdoms, when we consider the functions performed by the members of each taken collectively. It is only in comparing particular individuals that we encounter difficulties. In a general sense, animals consume organic matter derived directly or indirectly from the vegetable kingdom, while plants obtain their nourishment from the mineral kingdom. Animals, by the process of respiration, absorb oxygen and breathe out carbonic-acid gas; while plants take carbonic acid from the atmosphere and climinate oxygen. Thus the great functions of animal and vegetable life are antagonistic, and between them the circulation of matter is constantly kept up. Other characters of a more evident kind may be given, by which animals may generally be distinguished from plants. Thus animals have the power of voluntary motion, and wander about in scarch of food, which they digest in internal cavities or stomachs. Plants, on the contrary, are stationary, and absorb the substances by which they are nourished through their external surfaces. These characters, as we have before stated, are not absolute marks of distinction; for there are many animals that pass their existence in fixed positions, and many that are stomachless; while, on the other hand, there are many plants which move from place to place, as if gifted with volition.

In studying zoology,—that part of natural history which treats of the structure, habits, and habitations of all animals, from man to the humblest animalcule, we find that a general plan or system underlies the innumerable diversiform beings included in the first kingdom of nature. To discover this plan has always been the highest object of the scientific naturalist, and the many beautiful schemes of classification which have been devised are the results of investigations undertaken with this view. A very cursory inspection of the forms and structures of the different tribes of animals which are constantly presenting themselves to our notice, might satisfy us, that amongst all there are resemblances and differences; between some the similarity being the prevailing feature, whilst between others the differences are most obvious. In a crude shape, zoological classification must have been employed by the earliest human inhabitants of the globe. first observers of nature must have seen that animals could be placed in natural groups, as the distinctions between quadrupeds, birds, fishes, and insects, are very obvious. Minor divisions must also have been made at a very early period; for instance, the division of heasts into herbivorous and carnivorous groups, and time of Aristotle, who has justly been termed the father of natural history, zoological classification was based upon obvious external characters, and was necessarily very imperfect. Aristotle's system was the first founded on the only sure basis—the organization or physiological character of each animal. His method has been followed by all his successors, but we need scarcely say that his classification no longer holds a place in zoology. Between the systems of Aristotle and Linneus, those of Alian, Pliny, Atheneus, Albertus Magnus, Belon, Gesner, Aldrovandus, Johnston, Ray, and Buffon, were auccessively introduced; but as all these have long since been discarded, we need not consider their respective merits. By Linnous the animal kingdom was arranged in six great classes; namely, Mammalia (sucklers), Birds, Amphibia (reptiles), Fishes, Insects, Vermes (worms). The primary distinctions between these classes are given in the following table:—

# Animal Kingdom

Heart unilocular (one-celled). Blood cold, red. External gills ..... Fishes.

Heart unilocular. Circulating fluid cold, white. With antonne ..... Insects.

With tentacula ... Vermes.

The Linnman system gave place to that of Cuvier, which is now followed so far as it agrees with recent discoveries. By Cuvier the animal kingdom was divided into four sub-kingdoms—Vertebrata, Mollusca, Articulata, and Radiuta. Recent authorities have, however, divided it into five sub-kingdoms, by splitting the Radiata into two, and rearranging some of its constituents. The distinguishing characters of Cuvier's great divisions may be thus stated:—

Vertebrata.—The animals of this sub-kingdom are obaracterized by the presence of a backbone and bony skeleton. The blood is red, the heart muscular, and the mouth is furnished with two jaws, placed one either before or above the other. They have distinct organs of sight, hearing, and smell, situated in the cavities of the face, and they have never more than four limbs. The sexes are ulways distinct. In the nervous system we distinguish two great centres of power, the brain and spinal cord.

In the other three sub-kingdoms, which may be grouped together under the general head of *Inverts-brata*, we place all animals void of backbone and bony skeleton

Mollusca.—The animals belonging to this great group have no internal skeleton, the muscles being attached only to the skin, which constitutes a soft contractile envelope. The nervous system is contained within this general envelope, together with the viscers, and is composed of several scattered masses connected by nervous filaments. Of the four senses, only those of taste and vision can be distinguished, and the latter sense is frequently wanting. Snails, slugs, oysters, and mussels, are molluscous animals.

Articuluta.—The nervous system of the third type of animal life consists of two long cords running longitudinally through the abdomen, dilated at intervals into knots, or ganglia. The organs of taste and vision are usually well developed. The envelope of the trunk is divided by transverse folds into a certain number of rings, to the interior of which the muscles are attached. The trunk often bears on its sides articulated limbs, but is frequently unfurnished with them. Worms and insects are included in this sub-kingdom.

Radiata.—In the radiate type the organs of sense and motion, instead of being arranged symmetrically on two sides of an axis, are disposed in rays round a centre. There is no very distinct nervous system, nor are there any organs of particular senses. This sub-kingdom embraces all those animals known as zoophytes, the star-fishes, and other lowly forms of life. The following classification is taken from that given by Mr. Jukes, in his "Manual of Geology," and which was supplied to him by Professor Harley. The dassification of the menualis is that recently devised by

The following classification is taken from that given by Mr. Jukes, in his "Manual of Geology," and which was supplied to him by Professor Harley. The dassification of the mammalia is that recently devised by Professor Owen. In examining this comprehensive scheme, the student must be guarded against taking the arrangement as strictly a linear one. The highest animals are doubtless placed first, and the lowest last, and this idea of subordination runs throughout: but it is impossible to carry it out accurately in detail, since many of the orders should be arranged side by side, or, still more properly, in circles, in order strictly to express their mutual relations:

# SUB-KINGDOM-VERTEBRATA. Class I.-Mammalia.

rise to many very remarkable phenomens, has been rashly ascribed to a peculiar modification of magnetic force. Those few who have studied mesmeric manifestations in a scientific spirit have, however, very wisely discarded the term animal magnetism, as it pretends to define an agent that is at present quite incomprehensible. (Sci MRSMERISM.)

ANTHAL STRENGTH, the power which can be exerted by human beings, horses, oxen, &c., to produce certain effects, with or without the aid of machinery. Animal strength can be employed as motive power in different strength can be employed as motive power in different ways, but varies according to the conditions and circumstances under which it is exerted; and, although the powers of individual animals of the same species are yieldy different, it is important to gather general data, from which it may be ascertained what amount of work may be obtained from any animal agent with out injury to bodily health or powers, by undue fatigue or exertion. The greater the load an animal draws or carries, the less can be the speed with which it proceeds; and, conversely, the greater the speed, the less the weight an animal can bear. There must then be a certain weight which an animal can just set in motion or support, or which will exactly balance the motive of the animal, and there must be a certain speed power of the annual, and there must be a certain speed at which it can proceed without any burden whatever, which will be lessened in proportion to the quantity which it may be compelled to bear or draw. No useful effect, for a stance, can be obtained by allowing a horse to gallon at its atmost epical without rider or burden of any kind, or to be attached to a load which it can-not set in motion, or barely move. There must, then, be a certain relation between the speed and load which will give the greatest amount of useful work; and this will differ for different animals, and even for the same will differ for different animals, and even for the same animal under different conditions. In measuring the effect of action, Coulomb obtained his expressions of strength by multiplying the weight of the burden carried by the distance to which it could be conveyed in eight hours, that time being taken as the average duration of a working day. In determining comparative expressions of strength, care must be taken to adopt the same unit of weight and distance in all cases. The pound avoirdupois is generally taken as the unit of weight, while the unit of distance is either a foot,

yard, and foot, successively, as the unit of distance. 160×30×1 =4800 160×30×1760=8448000  $169 \times 30 \times 5280 = 25344000$ 

yard, or mile. For the sake of explanation, suppose a man to be able to walk 30 miles duly without any load. and his weight to be 160 lbs., we get the following sumerical expressions of his strength, taking a mile,

the result 4,800 indicating that his strength is equivalent to a motive power that would move 4,800 lbs. one mile in a day, or I lb. 4,800 miles in a day; the next showing that he can exert a force sufficient to move 8,418,000 lbs. one yard in a day; and the third a force that can move 25,344,000 lbs. one foot in a day. It has been found, however, that a man of average strength can carry 120 bs. 10 miles in a day, giving 1,200 as the expression of the useful maximum effect of a man's strength, taking a mile as the unit of distance, and neglecting the weight of the man. The strength of a horse is generally considered to be equivalent to the strength of expressions. of seven men, the horse being attached to a wheel such as is used for applying motion to threshing machines, cider-presses, &c., and the men working at a windlass; a horse exerting a tractive force of 125 lbs. for 24 miles in a day, would exert power equivalent to a machine moving 3,000 lbs. one mile in a day; but 33,000 is generally used to denote the average power of a horse, showing the weight in pounds that can be drawn one foot in one minute for eight consecutive hours; for Boulton and Watt determined that a horse can draw 125 lbs. 3 miles in one hour, giving 3,000 as the number of pounds thank one rile in one day, or 23, 1000 as the number of pounds of the propose of the number of pounds. drawn one mile in one day, or 33,000 as the number of pounds drawn one foot per minute for eight hours, by the following process:—

3000 (lbs. drawn 1 m. in 1 d.) × 5280 (feetin 1 m.) = 33000 480 (minutes in 1 day of 8 h.)

The following are the comparative estimates of the labour of animals, the effect of a man's labour being to benzoin.

taken as the unit, according to the calculations of massenfratz:—In carrying loads on a level surface, man and dog 1, reindeer 3, ass 4, horse 8, dromedary 25, camel 31, slephata 147; in drawing loads on a level surface, reindeer 0.2, dog 0.6, man 1, ass 2, ox 5.5, horse 7.

ANIMAL SUBSTANCES.—The animal substances used in manufactures are extremely numerous, and may be disjuted into edible, industrial, and medicinal. The

edible animal substances will easily suggest themselves to the reader. Those used in manufactures are wood, silk, hair, bristles, skins, furs, whalebone, feathers, oils, wax, tallow, horn, tortoiseshell, pearls, shells, corals, sponge, due, gelatine, ambergris, music, civet, animal blacks, lacs, and cochineal. Those used in medicine are not so numerous. The principal ones are, Spanish fly, sodiliver-oil, and a few others. For information on the subject of the source or manufacture of these different substances, consult the articles under their respective headings.

Animaleulum, a little animal).—This is a general term for animals so exceedingly minute that they cannot be studied without the aid of the microscope; such as the species of Infusoria and Rotatoria. (See INFUSORIA, PROTOZOA, ROTATORIA.)

ANIMALS, AGE OF. (See AGR OF ANIMALS:)
ANIMALS, CRUELTY TO.—Various statutes have been passed for preventing cruelty to animals. By the 12 & 13 Vict. c. 92, it is causted, that if any person shall cruelly beat, ill-treat, overdrive, abuse, or torture the animals therein enumerated (which includes all domestic animals), he shall forfeit a sum not exceeding the animals that the property of the property o domestic animals), he shall torrest a sum not exceed the sum, not £5; and if the animal be injured, a further sum, not the start of the sum or nerson injured. The exceeding £10, to the owner or person injured. The act also inflicts penalties in the case of conveying any such animal in such a manner or position as to subject it to unnecessary pain or suffering, and also in the case of bull-baiting, cock-fighting, and the like; and makes a variety of humane provisions for the regulation of the business of slaughtering horses and other cattle not intended for butcher's meat; and for providing cattle impounded, with food and water. The 17 & 18 Vict. c. 60, extends the powers of the former statute in the case of impounded cattle, and prohibits the use of dogs

case of impounded cattle, and prohibits the use of dogs for purposes of draught, under a penalty of 40s. for the first, and not exceeding 45 for any subsequent offence. ANIMALS, WORSHIP OF. (See IDOLATIK.)

ANIMALS, WORSHIP OF. (See IDOLATIK.)

ANIMALS, and i-i-me.—This substance, called also gum anime and East-Indian copul, is extensively used in the preparation of varnishes, and is supposed to be the produce of the West-Indian locust-tree, Hymenaca Courbarit. The resin which exudes from the piny dammar (Vateria indica) is sometimes confounded with subme.

Anime, an'-i-mai (Fr.), a term used in Her., to denote that the eyes of a rapacious creature are borne of a different tincture from the creature itself.

ANIONS, an't-t-one (Gr. ana, upward, ion, going), a term introduced by Faraday to distinguish the elements which go to the anode, or positive pole, in decomposing chemical compound by the electric current.

(See ELECTROLYSIS, CATHIONS.)
ANISE, in eez (Or. onison, Lat. anisum), an umbelliferous plant, cultivated in Egypt, Malta, Spain, and Germany, for the sake of its fruit, called anisced, which is extensively used for flavouring liqueurs and confections, and medicinally as a carminative. The botanical name of the plant is Pimpinella Anisum. Star or Chinese aniseed is the fruit of the Illicium anisutum, a small tree in the nat. ord. Magnolioceae. It has a a small tree in the nat, ord. Magnalacce. It has a starlike form,—hence its name, and a flavour similar to that of the common anisced. This is imported into Europe from China and Singapore. Oil of anisced is obtained by distilling the figuit, and even the stems and leaves, of the common anisc. For this, a similar product, yielded by the star anisced, is frequently substituted. The true oil and its substitute bave the aromatic properties of the fruits, and are employed for the same purposes.

the same purposes.

Anisic Acid, and sik, obtained, in almost insoluble crystals, by acting on oil of unise with nitric acid. It is easily soluble in ether and alcohol.

Anison, an is-is-oin, obtained by acting on oil of anise with sulphuric acid. It is analogous in properties

#### Anisol

Anisol, an'-i-sol, a colourless mobile fluid, pre-pared by distilling anisic acid with caustic baryta. It boils at 306° F.

Anisomerous, an-i-som'-e-rus (Gr. anisos, unequal, meros, a part), in Not., a term applied to a symmetrical flower, in which the number of parts in every whorl of organs is not the same, as in the flower of the sedum, which has five sepuls, petals, and carpels, but ten stamens. (See Isomemous, Flower.)

ANISOSTRMONOUS, an'-i-nos-tem'-o-nus (Gr. anisos, unequal, stemon, a stamen), in Bot., a term applied to a flower in which the stamens are not equal in number

to the sepals or potals. (See Isostemonous.)

Annals, an'-näis (Lat. annus, a year), a term usually employed to denote a plain narrative of historical facts, arranged under the particular years in which they happened. It differs from history, masmuch as the events are strictly arranged in the order in which they occurred, those of one year being completed be-fore those of another are begun. It differs also in being usually a bare narrative of events, without, as in history, the author's opinions and remarks being interspersed. Annals require brevity; history demands ornament. Annals may be said to furnish the elements or materials out of which history is composed.

Annatto, an-nad'-to, also called annotto and arnotto. An orange-coloured dve-stuff, obtained from the seed of the Bixa orellana, and brought to this country in rushes from South America. It is soluble in alkalies, by which means it is fixed in cloth. Nankeen is dyed with this substance.

Annealing, an-neelling (Sax. analan, to kindle or inflame), a process of gradual cooling, which is applied to glass and certain metals, to prevent them cracking or breaking under any sudden alteration of temperature. Glass vessels are often im-properly annealed by being cooled too quickly; hence they crack in all directions when hot water is poured into them. Good housewires should therefore bail all glass vessels, and allow them to cool very gradually, before using them for hot liquids. The glass beakers used by chemists are so perfectly annealed, that they may be removed from the fire and placed at once on a cold slab without cracking. Brittleness in glass and metals is evidently caused by an approach to the crystalline state, which is destroyed by gradual cooling. (Sec STEEL.)

ANNELIDA, ün-ne-li'-dü (Lat. annulus, a ring; Gr. eidos, form), in Zool., a division of animals of the worm species, first proposed for distinct classification by Cuvier, who attached such importance to the fact of their possessing red blood, that he placed them at the head of the articulate series, above the crustaceas, the arachidas, and the insects. It is, however, gene-rally agreed that the annellida represent but the larval condition of insects, and can hardly be regarded as higher in organization than the perfect insect. The name of the class is derived from anadas, a ring; because the animals arranged under this division unways have their bodies formed of a great number of small rings, as in the carth-worm. (See Earth-worm.) For the most part, the anselida are origarous. In their mode of life there is little variety: some live in fresh. others in salt water; some, like the hair-worm (Gordius), are amphibious. The body is divided into numerous segments, marked by transverse lines, and generally furnished with a series of bristly appendance. which serve as legs. The said bristles are usually sharp, and sometimes burbed, serving not only to attach the animals to soft substances, and to hold firmly on to rocks and other solid bodies, but to aid their movements through the water.

ANNIHILATION, an-ni'-hi-lui'-shun (Lat. ad. to, nihil nothing), the act of destroying or reducing any created being into nothing. It is opposed to creation, which is the making of something out of nothing. Much difference of opinion has existed on the subject of aunihilation. According to some, nothing is more difficult; it can only be effected by the infinite power of the Creator: according to others, nothing is more easy. The latter maintain that existence is a state of

# Annual Register

place in the bodies around us, are mere alterations of form, and not annihilation. According to Dr. Eurnet, the idea of annihilation arose from the Christian theology, and that, in its present sense, it was nuknown to the Hebraws, the Greeks, and the Latins. The ancient philosophers, in effect, deuted all antibilation, as well as creation, resolving all the changes in the world into new modifications, without supposing the production of anything new or the destruction of anything old. Some Christians half they cled will sent the sent that the control of anything old. thing old. Some Christians hold that Got will suni-bilate the souls of the damned after a certain period of punishment, and that this annihilation is the second death. That the buman soul is not subject second death. That the human soul is not subject to annihilation, but, after this life, passes into another state of existence, is a doctrine founded both on reason and revelation. There is, perhaps, no race, how ver savage or uncivilized, that has not some idea of a future existence. Without such a belief, the present state of man becomes inexplicable. He is endowed with faculties and capacities fitting him for a sphero of existence far transcending the present, which otherwise must have been created in vain; while the moral government of the world can only be understood by regarding it in connection with a future state of being.

Annihilator, Fire, an-ni-hi-lui-tor, in Mech. a machine for extinguishing fires, invented by Mr. Phillips, and bearing his name. It consists of a case containing water, within which is a smaller case filled with a mixture of chlorate of potash and sugar. Dipping into the latter is a small tube containing sulphuric acid. When this tube is broken, the chlorate of potash and sugar become ignited, throwing off large quantities of mixed gases which are non-supporters of combustion. The action is maintained by the water in the outer case becoming heated. The apparatus seems to be of great use in extinguishing flame, but appears to have no action on red-hot materials. It has been used with much advantage in extinguishing fires on board ship, when

applied at an early period.

Anniversally, an-ni-vert-soi-re (Lat. annus, a year, and versum, turned), is a term applied to the yearly return of any remarkable day. Literary and scientific associations usually celebrate the anniversary of their institution; and in domestic life it is usual to observe the birthdays of the different members of a family. The birthday of the reigning monarch is generally observed as a holiday. Anniversary Clays are festivals celebrated by the Romish church in honour of the Anniversary Clays are festivals

ANNO DOMINI, an-no dom'-i-ni (Lat., in the year of our Lord), a cern used in chronology to denote a year since the incarnation of our Saviour. It was first adopted in 525, and is usually contracted A.D. The period from the birth of Christ is termed the Christian or the Vulgar era. (See ERA.)
Annodated, an-no-dai'-ted, is a term used in Her. to

denote anything bent somewhat in the form of an S. The serpents in the caduceus of Mercury are said to be annodated or entwined about the muce or staff.

Annotation, an-na-lai'-shun (Lat. annotatio, from ad, to, and notatio, a marking), a term commonly used: in the plural, and applied to remarks, notes, or commentaries on certain passages of a book, designed to illustrate their meaning. An annotated edition of a work is an edition having such annotations.

Annual, an'-nu-al (Lat. unnue, a year), in Bot., a plant which passes through all its successive stages of development in a single year. Such a plant produces flowers and fruit only once, and perishes when its fruit has become ripe. A plant which springs from the seed one year, but which does not flower until the next year, is called a biennial; and a plant which lives for several years a perennial. The duration of the life of a plant is greatly affected by accidental circumstances; and an annual is frequently converted into a biomnial, and occasionally into a perennial. The annuals culti-vated in our gardens are very numerous, and many of them produce lovely flowers.

ANNUAL REGISTER is the name of a well-known annual publication, which first appeared in 1759, and which is still carried on. Various works of a similar nature violence; that all things are constantly striving to bid previously been published, as Boyer's Political return to their primitive nothinguess; and that it state of Europe, from 1711 to 1739; and the Mistorical Register was as it may, we know that the changes wee see taking projected by Robert Dodsley, the bookseller, assisted.

82

### Annuals

by Edmund Burke, who for some years wrote the his-torical parative; and it is said that much of it was written from his dictation for about thirty years. In 1781 was published the first volume of the New Annual Register, projected and edited by Dr. Kippis; but it never attained the reputation of its rival, and came to a close in 1825. The Edinburgh Annual Register was commenced in 1868 and terminated in 1827. The hiscommenced in 1808 and terminated in 1827. The historical narrative was for some years written by Sir Walter Scott, and afterwards by Southey. A French Waller Scott, and anterwards by country. A French work, in imitation of the Annual Register, appeared at Paris in 1825, for the year 1818, under the title of Annualre Historique Universel, and is still continued; the last volume, which was for 1856, being published in 1861. The first volume of the Annuaire des Deux Mondes, in connection with the well-known review of that name, appeared in 1951. An American Annual Register is published at New York.

Annuals, the name of a class of books that were

for some years very popular in this country. They were usually of a light literary nature, tastefully got up, and illustrated with finely-engraved prints, and appeared about Christmas. The first of them, Forgatme-not, was began in London in 1822; and the following year two others, Friendship's Offiring and The Graces, and their appearance. The Literary Sourchir was commenced in 1824 by Alaric A. Watts, and was a great improvement upon its predecessors. The Keepsuke was commenced in 1827, under the editorship of W. H. Ainsworth. In 1829 no fewer than seventeen different annuals were published; in 1840 the number had dwindled to nine. Of the Literary Sourceur, ten vols. were published; of the Forget-me-not, twenty-two; the Keepsuke, the last of the race, appeared finally in 1856. The place of these annuals may be said to be now occupied by the illustrated editions of popular works, which many of the publishers bring out about Christians; but they have formidable rivals me-not, was begun in London in 1822; and the following out about Christmas; but they have formidable rivals in the Christmas numbers of All the Year Hound, the Christmas double numbers of the Illustrated London News and Queen, and the Christmas Annual, first put forth by Mr. Beeton. There indeed appears a possibility that these last fruits of publishing enterprise will usure the place of the "illustrated editions," or "table-books," just as the latter came to editions," or "table-books," just as the latter came to occupy the position left vacant by the old "annuals."

ANNUITY, an-nu'-i-te (Lat. unnus, a year), is a cortain annual sum of money, which may be paid annually or at certain fixed periods of the year, as half-yearly, quarterly, monthly, &c. There are various kinds of annuities, as for a certain number of years, for one or more lives, or in perpetuity. Deferred annuities are such as are not payable till after a certain period or event. From the great variety in the nature of annuities arise many complicated calculations in connection with them. An annuity is usually raised by the present payment of a certain sum, in consideration of which the person making the payment, or some one unned by him, becomes entitled to an annuity for a stipulated number of years, or till a certain event, which is usually the death of the annuitant. If money did not bear interest, the value of an annuity for a certain number of years would simply be the annual sum multiplied by the number of years for which it was to be paid,—as an annuity of £10 for ten years would simply be £100. But, while paying the annuity, the person engaging for it is drawing the interest of the price. Thus, if £100 were paid for an anality of £10, the interest being at 5 per cent., he would have the interest of £100 for the first year, =£5; the interest of £95 for the second year, =£4. 15s.; the interest of 4.93 for the second year, \$\tilde{L}\$. 15a.; the interest of 1899, 15a. for the third year; and so on. In this way, the present value of an annuity of £10 for one year (interest being at 5 per cent.) is £10, 10a. 6d.; for two years, £18. 11a. 10d.; three years, £27. 4a. 8d.; four years, £35. 9a. 21d.; five years, £24.5 fa. 11d.; ten years, £77. 4a. 6d.d.; twenty years, £12b. 12a. 15d.; for ever, £200. Where the annuity is dependent upon the life of an individual, the calculation is much more complicated. for here it becomes necessary to supertial into cated; for here it becomes necessary to assertain, not only the present value of the anuity, but also the probable duration of the life of the individual. Of ecurse, in the case of one person, he may die within the first year, or may live to extreme old age; but it is found that, where a number of persons are con-

### Anodyne

cerned, the average duration of life may be calculated with great nicety. Various tables of mortality have been constructed. The best known are the Northampton Tables of Dr. Price and the Carlisle Tables of Mr. Milne, the latter being regarded as the more accurate of the two. The government annuities are valued according to a table calculated by Mr. Finlaison from according to a same canadrated by BIT. Finiason from the mortality found among the different classes of go-vernment annuitants, and which distinguishes males from females. From this last we give the following table of the value of a life annuity of £1 at different periods of life, the rate of interest being 4 per cent.:—

Age.	MALE.	FEMALE.	AGE.	MALE.	FEMALE.
3	19.0660	19:8135	40	14.8752	16:1560
2	19-1912	19.8981	45	13.7975	15.2686
3	10.2642	19/9512	50	12.4299	14-1610
4	19:2880	19.9795	55	11.0392	12.7904
5	19:2699	20.0008	60	9:7207	11.2609
10	18:7817	19:7014	65	8-2163	9 5765
15	18:0044	19.0594	70	6.7745	7:8580
20	17:2048	18 6130	75	5 4103	6.2640

Annuity (Lat. reditus annuus, an annual return or income), in Law, is a yearly sum, chargeable only upon the person of the grantor, and is distinguished from a rent-charge, which is a burden imposed upon or issuing out of land. Formerly, certain acts of parbiament imposed checks on the grant of life annuities, but they were repealed by 17 & 18 Vict. c. 90, which nevertheless provides for their registration in a mode similar to the registration of judgments to affect or charge real estate.

ANNULAR CELLS and VESSELS, an'-nu-lar (Lat. annuhandland the business and the state of a plant are made up of little membranous sacs and tubes called cells and vessels. These are often strengthened by delicate threads or bands called fibres, formed by secondary deposits on the inner surfaces of the primary membranes. When these fibres exist as places of When these fibres exist as rings or hoops, the cells and vessels containing them are said to

Annulata Sedentaria, an'-nu-lai'-ta sed'-en-tair'-i-a, a carnivorous tribe of worm-like animals, inhabiting a tube-shaped shell, which they never quit. They are usually found adhering to marine substances.

Annulate, an'-nu-lait (Lat. annulus, a ring), in Bot., a term applied to those ferns which have ringed sporangia (cases containing spores). The annulus or ring surrounding each sporangium is elastic, and its pressure causes the organ to burst when ripe, and release the spores. Those ferns which have sporangia not encircled by rings are said to be exannulate.

ANNULATED ROOT, an-nu-lai'-ted (Lot. annulus, a ring), in Bot., a root having a number of ring-like ex-pansions, so as to present the appearance of a string

of thick rings, as in the ipecacuanha.

Annunciation, ün-nun'-si-ai'-shun (Lat. annuntiare, to announce), the name of a festival celebrated March 25th, in commemoration of the announcement made 23th, in commemoration of the announcement made by the angel Gabriel to the Virgin Mary, that she was to become the mother of our Lord. It is also called Lady-day, and was instituted, according to some, in the 4th, according to others, not before the 7th century.

Ano., an'-o-a, a ruminating animal of Sumatra, but so imperfectly known, that reologists are undecided how it should be classed. Judging, however, from the unterials imported, merely a few bones and fragments of skull, it would seem to be a species intermediate between the buffulo and antelope.

Detween the busine and anetope.

ANORUM. (See DEATH-WATCH.)

ANOR, int-ode (Gr. ana, mward, odes, a way), a term introduced by Furaday to designate the positive pole of any electrical arrangement for decomposing a chemical compound. The snode, or positive pole, is the surface by which the electric current enters the body undergoing decomposition. (See Electrolysis, Cathode.)
Anodyne, an'-o-dine (Gr. a, without, odune, pain),

83

### Anogens

a medicine which allays pain. The term is usually applied only to a medicine which acts upon the nervous system, so as to decrease sensibility and induce sleep, or a state of partial unconsciousness. The most important anodynes are preparations of opium. Anodyne pills, each consisting of one-eighth of a grain of sectate of morphia and half a grain of extract of hyosoyamus, have lately been extensively employed by medical prac-

ANOGENS, an'-o-jens, in Bot, this term has been used to designate a division of the vegetable kingdom, including the liverworts and mosses, which are usually

classed with the Acrogens.

ANOINTING, id-noind-ting, signifies the pouring on of oil, a custom which was, and still is, very prevalent in the East. The custom doubtless arose from the health and comfort which, in hot climates, result from the pouring or rubbing oils upon the person. The oils were usually highly scented. To anoint a guest was to show him one of the highest marks of respect. Among the Jews, anointing was considered necessary as the preparation of the person for rare and great occasions. It also denoted the consecration to a sacred office, as that of king or priest; and even vessels for the service of the tabernacle were anointed before being used. The custom of anoming priests still exists in the Roman Catholic church, and that of anomining kings in Christian monarchies. (See CORONATION.) The ancient athlets anomited themselves in order to render it more difficult for their antagonists to get hold of them. The anointing of oil was also regarded as a means of restoring the sick; and, in the present day, it is said to be of use in consumption, rheumatism, &c.

ANOLIS, or ANOLIUS, a-no'-li-us, a reptile peculiar to America, supplying in many respects the place which the chameleon occupies in the old world. The colour of the skin, especially that about its loose baggy throat, assumes an endless succession of ever-varying lines, as the animal is disturbed by love or anger. The anolis, however, is more slenderly built than the chameleon,

ANOLIS.

and more active in its movements. It varies from seven or eight inches to a foot in length, and is extremely tame and harmless. Its food consists of flies and other small insects. The head is long, straight, and flattened; the body and tail slender; and both are covered with small round scales, which give

both are covered with small round scales, which give the skin the appearance of fine shapreen.

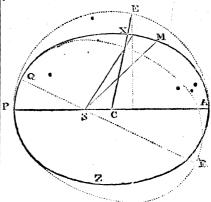

Anomalistic Year, in now!-a-lis-tik (Gr. anomalos, irregular), in Astron. the time which the earth takes in passing through its orbit from its perihelion, at which it is at its least distance from the sun, until it again arrives at that point. Under the disturbing influences of the planets, the perihelion of the earth advances 11"8 yearly, following the direction of the carth's path. In the figure, let 8 represent the sun, one of the coil of the allies described yound that hady by the path. In the figure, let S represent the sun, one of the foci of the ellipse described round that body by the earth, A the earth's aphelion, I its perihelion, at opposition of the ellipse described in the earth of the ellipse described in the ell carth, A the earth's sphelion, P its perihelion, at oppodrive extremities of AP the greater axis of the ellipse.

Now if the earth travelled round the sun in the fixed
path of the clipse PQAZ, it would accomplish its
revolution in 365 d. 54. 48 m. 49 s., the leugth of a solar
period of the clipse PQAZ, it would accomplish its
had a nature different from, and in nothing resembling
that of God; whereas the Semi-Arians held that there
resemblance between the two natures. The
war a resemblance between the two natures. The
anomeans were condemned by the Semi-Arians at the
council of Seleccia, D. 359; but the former averaged
the earth, atter passing from P over the whole path of
the ellipse until it arrives at P again, has to more over
the additional space PQ before it arrives at its perihestructure.

ANOMOTERIE, and—mop'-te-ris (Gr. anomos, without rule, pleris, fern). In Gool, this term is applied to

### Anomopteris

lion, or nearest point to the sun, now represented by Q. The anomalistic year is 25 minutes longer than a Q. The anomalistic year is 25 minutes rong, solar year, and 4 min. 10 sec. longer than a sidercal

ANOMALISTIC YEAR.

Anomalous, a nom'-a-lus (Gr. a, without, nomos, a rule), in Bot., this term is applied to all parts of a

plant when they have very irregular or unusual forms.

Anomaly, a-nom'-s-le (Gr. anomalos, irregular, unequal), in Gram, signifies an irregularity, as exception or deviation from rule. Anomalous verbs are such as are not conjugated conformably to the rules of their conjugation, as, lego in Latin, to give in English.

Anomaly, used in Astron. to denote the angle made

by lines drawn from the perihelion of a planet and its position in its orbit at any time, which meet in that focus of the ellipse described by the planet which denotes the of the empse described by the planet which denotes the position of the sun. Thus, in the figure in the article upon anomalistic year, X being the position of any planet in its orbit, P its perihelior, and S the sun, the angle PsX is the anomaly. This is sometimes termed true anomaly, to distinguish it from mean and eccentric anomaly. The true anomaly is the angle at the sun, between the position of a planet at any point of its between the position of a pianet at any point or us orbit and its perificion, the pianet moving in its orbit at a varying rate of speed, quicker when at its perificion, and slewer at its aphelion. Now the mean anomaly is the angle at the sun between the perificion and an imaginary position of the planet, being the place in its orbit where it would be, supposing it to place in its orbit where I would be, supposing it to move always at its mean or average speed, instead of the position it actually occupies at the same time, moving at its variable rate of progression; while the eccentric anomaly is the angle at the centre of the ellipse between the perihelion and a point in the cir-cumference of a circle described from the centre of the ellipse with a radius equal to half its greater axis, de-termined by a perpendicular drawn from the actual position of the planet to the axis, and produced to cut the circle. Thus in the figure, supposing X to be the position of any planet travelling at its variable rate of progression at any given time, and M the position it would occupy at the same time if it had travelled from its variable travelling at the position it would occupy at the same time if it had travelled from its perihelion at its mean speed, the angle PSX is the true anomaly, the angle PSM the mean anomaly, and the augle PCE the eccentric anomaly.

Anomeans, the occurre anomaly and differently, in church history, the name by which the pure Arians came to be distinguished in the 4th century. They were so called from their maintaining that Christ

a genus of lossil ferns peculiar to the new red sandstone. The plants differ from all recent and fossil ferns; hence the generic name, which signifies 'anomalous fern.'

Anona, a-no'-na, in Bot., the custard-apple, a genof plants belonging to the nat. ord. Anonaceae, and
composed of small trees and shribs growing in the
West Indies and South America, where they are cultirated for the sake of their delicious fruits. The most
important species are A. squamosa and A. maricala.
The first, commonly known us the sweet sop, is found
in all the West-India islands. The fruit is covered
with greenish scales, and has the appearance of a young
pine-cone. The chilbe portion consists of a thick,
sweet, and luscious pulp. A. maricala, the sour sop,
which is also a native of the West Indies, is a picturesque small tree, bearing a yellowish-green fruit,
weighing from I lb. to 3 lbs., and covered with weak
prickles. Its pulp is perfectly white, and has a most
agreeable acid taste. A. reliculata yields the netted
custard-apple, a large dark-brown fruit, filled with
yellowish or reddish pulp of about the consistence of
custard. A. cherimolia is cultivated in Pern, on account
of the excellence of its fruit, which is called the cherimolia. Two other important species have been described,—A. sylvatica (the Aratica do Muto of Brazi)
and A. palustris, both of which farnish light and bandsono wood, used for turnery.

some wood, used for turnery.

Anonacer, in-o-nuc-se-e, in Bot., a nat. ord. of dicotyledonous plants, of which the type is the gen. Anona. They are trees or shrubs, with leaves alternate, simple, and without stipules. In the flower we find a calyx of three sepals, and a corolla of six leathery petals, arranged in two whorls. The carpels age usually numerous, distinct or united; the stigmas simple, and the ovules inverted. The fruit is composed of a number of dry or sucenheu carpels, sometimes distinct, but oftener united, so us to form a fiesty mass. The plants of this order are almost entirely confined to the tropical regions of Asia. Africa, and America, none being found in Europe. They are generally aromatic and fragrant in all their parts, and some are very useful. (See Anona, Cellocline,

some are very useful. (See Anon., Chicolines, Duguria, Xilopia.)
Anonymous, & mod-i-mus, a term derived from the Greek, and signifying literally without a name, or nameless. It is applied to hooks which do not bear the name of the author. When an assumed name is given, the term pseudomymous is used. It is frequently a matter of importance in literature to know the author of an anonymous work; and hence several excellent works have appeared in Germany and France on this subject; as, Placcius "De Scriplis et Scriptoribus Anonymis et Pseudonymis Syntagma," Hamburg, 1708; and the excellent work for Barbier, "Dictionaire des Ouvrages Anonymes et Pseudonymoum," Hamburg, 1708; and the excellent work of Barbier, "Dictionaire des Ouvrages Anonymes et Pseudonymes," second edition, 4 vols., Paris, 1822-25, giving the names of about 24,000 works, with the kind of the second colleals, are anonymous, a system which, while it secures greater freedom to the writer, occasionally leads to abuse. The sending of anonymous letters demanding money or denouncing persons was made felony by 9 Geo. I. (1722), 8 Geo. IV. c. 20 (1827), and I Vict. c. 87 (1838).

ANOFDOTERICUM, \$\doldownohearrow\text{oplon}\$, weapon, \$\doldownohearrow\text{oplon}\$, beast), in Geol, a gen. of extenct quadrupeds, established by Cuvier from bones found in the Paris tertiaries. Several species have been determined, the smallest having been little larger than a guinea-pig, and the largest about the size of a small ass. From the situations in which their remains have been discovered, these ancient inhabitants of our globe appear to have lived in herds in swamps and marshes. They all had slender legs and icet, with but two toes, as in the ruminants, and were the earliest bi-hoofed animals known to have existed on the earth. In some the tail was short and thick, and was probably made use of in swimming; in others it was short and slender. The dentition of the genus appears to have been very peculiar, each jaw having had six incisors, on each side of which was a small canine, and behind these, without leaving any interval, seven molars,

resembling those of the rhinoceros. The common anoplethere (A. commune) has been taken as the type of a small natural family,—the Anopletheridae, which appear to form a connecting link between the pachyderus, or thick-skinned mammalia, and the ruminants. Cuvier, in describing this typical species, showed that in one respect it stood between the pippopetamus and borse, and in another, between the hippopotamus and camel. The restorations of the anoplotheres and other ancient animals, by this great comparative unatomist, from the mutilated remains found in the gypsum-beds near Paris, may be regarded as one of the most splendid achievements of paleoutology. The mane Anoplotherium, which signifies 'weaponless heast,' was given to the genus from the fact that all the species seem to have been destitute of organs of defence, as tusis, claws, or horns.

ANOPLULA, ōa-o-pla'-ra, a fam. of insects, in which are comprehended the Aptera of Linnaus and the many varieties of Pediathus (see Pedicturs), as well as the parasitic insects of other writers. About 500 different forms of Anoplura, all of them parasitical of them bearing a close resemblance to the human parasite, the louse, have been described. As a rule, only one species of anoplura attacks a single species of animal; but in engles and gulls as many as five different species have been discovered.—Ref. Denny's Anoplura Britannica.

ANORTHITE, an'-orth-de (Gr. a, without, orthos, right), a species of felspar, containing lime instead of potash combined with silicate of alumina.

ANSRLL'S FIRE-DAMP INDICATOR.—This ingenious instrument, which is founded upon the laws which govern the diffusion of gases, is intended to make known at a distance the presence, in a coal-pit, of fire-damp—the miners' deadliest onemy. The instrument consists of a small india-rubber balloon, filled with atmospheric air, and fixed under a lever. This lever is connected with a galvanic apparatus in such a way that a very slight motion will either make or break the circuit. If this apparatus be placed in an atmosphere containing a dangerous percentage of coal gas, the gas will rapidly permeate the atmospheric air in the balloon, distend it longitudinally, press upon the lever, and thus set the bell ringing on the spot, and, by means of the galvañic apparatus, another in the manager's office. The bells go on ringing so long as there is any fire-damp in the part of the mine at which the apparatus is placed. Mr. Ansell has also invented a form of apparatus for giving immediate warning of sudden irruptions of fire-damp.—Ref. Mechanics' Mayazine, 1865.

Ansers, an'eserve's (Lat. auser, a goose), the third order of the Linnman class Ares, thus characterized:—A smooth beak, covered with skin, gibbous at the buse, and broader at the point; feet formed for swimming, having palmated toes, connected by a membrane; the legs thick and short; the body bulky, plomp, and downy. Food—fishes, frogs, aquatic plants, &c. (See Goose.)

Answer, in sector (Etym. unsettled; Gothic, audsver; Danish, answere or answarer; Sax. anshairan; to reply to a question, objection, or assertion; to justify), in Law, is a pleading or reply, whereby an allegation in a bill of complaint in chancery, or inquiries arising thereout, or in a libel or articles in the ecclesiastical and other civil courts, is or are replied to or rebutted. In chancery, the interrogatories were formerly included in the bill; but now the practice is for the planniff to exhibit separate interrogatories, which the defendant is bound to answer upon eath, or, in the case of a peer or peeress, upon honour; and the party may be called on to answer viva core (except in criminal cases), or on interrogatories exhibited. But in no case can a man be compelled to give an answer which might criminate or degrade him. And any party to a suit may put forth interrogatories to be answered by any one or more of the others.

ANT, ant (Lat. Formica), a well-known genus of hymenopterous insects, which from the very earliest period of the world's history have attracted attention on account of their social and industrious habits, their love of order and subordination, and unremitting economy. They are distinguished from other Hymenoptera by their habit of residing underground in numerous societies, and by the existence of neuters among them, ny which class the laboure of the community are chiefly performed. Although so small, their muscular strength is extraordinary, and they will carry loads at least tentimes their own weight, displaying meanwhile considerable society. They have a triangular head; the antenne are geniculate; the jaws strong; the ligula, or lower lip, small, rounded, or spoon-like; the thorax compressed at the sides; the abdomen nearly oval, the pedicle which joins it to the thorax forming in some kinds a single and in some a double scale or knot. A community of ants, whatever the species may be, consists of males, which have always four wings; of females, much larger in size than the males, which only possess wings during the pairing season; and of a sort of barren females, which have been variously termed neuters, workers, or nurse-ants, and which, so far as is known, have never been observed to have wings in any stage of their existence. The nests of ants are differently constructed in the different species; all, however, are very curiously and regularly arranged. "If an antill be examined any time after midsummer up to the close of suturn, there may be seen mixed with the wingless workers a number of both males and females furnished with white glistening wings. These, however, are neither kings nor queens in the state, at least so far as freedom of action is concerned; for they are not allowed to more without a guard of workers to prevent them leaving the boundaries; and, if one straggles away unswares, it is for the most part dragged back by the vigilant sentinels, three or four of whom may in such cases be seen huning along a winged deserter by the wings and limbs. The workers, so far from ever facilitating the exit, much less the departure of the winged ones, more particularly the females, gnard them most assiduously in order to prevent it, and are only forced to acquiesce when the winged ones become too numerous to be either gnarded or fed. There seems, indeed, to be a

(MAGNIFIED, WITH EFD OF CLAW MORE HIGHLY MAGNIFIED.)

The actual pairing does not seem to take place within the ant-hills; and we have observed scouts posted all around ready to discover and carry back to the colony as many fertile femples as they could meet with. Nay, we are quite certain that whole colonies have thus been

dispersed; and, when they did not find ferrile females near their encampment, they have gone farther and farther, till they found them; and, if they had gone very far, never returned, but commoned a number of new establishments, according to their convenience. It is probable that, soon after pairing, the males die, as do the males of bees and other insects; for, as the workers never bring any of them back nor take any notice of them after leaving the ant-hill, they must perish, being entirely defenceless, and destitute both of a sting and of mandibles to provide for their sustenance. It was supposed by the ancients that all ants at a certain was supposed by the ancients that an interest is certain age acquired wings, but it was reserved for the younger Huber, is particular, by means of his artificial formicaries, to trace the development of the wings in the female, from the first commencement till he saw them stripped off and laid aside like cast clothes."—(Broderig.) The eggs of ants are so small as to be sourcely visible to the naked eye. Contrary to what takes place in most insects, the eggs when laid are not glued to any fixed place, but are dropped at random by the mother in her progress through the nest, and carefully collected by the workers, several of whom sedulously attend her by the workers, several or whom sequences are taken to the various apartments of the nest adapted for the purpose, and there left for hatching. Heat being indispensable, the eggs are placed carefully during the day near the surface of the ant-hill, but so sheltered from the direct influence of the sun, as to prevent the too rapid evaporation of their moisture. As night approaches, the experienced insects to whom the cure of the precious ova is intrusted, remove the eggs to warmer quarters, to prevent the escape of the heat they naturally possess. Nor does the care of these tender nurses cease when the little ants come into life. At night they are carefully stowed away in the innermost chambers of the nest, every aperture being closed to prevent the ingress of cold air. But as soon as the rays of the morning sun fall upon the surface of the nest, the workers busily commence carrying their infants to the upper chambers, where, close under the root, they may enjoy the genial warmth. Not unfrequently, they even place them for a time on the outside of the nest, exposed to the direct rays of the sun. During their grubhood, the little creatures are fed by the nurses, or by the mother herself, by a liquit disgorged from the stomach. When the grubs are full grown, they spin coccons of a membranous texture, and of a brownish-white colour, in appearance not unlike barleycorus, for which, indeed, they were mistaken by early observers. Hence, doubtless, arose the belief that the insect laid up a store of grain in the summer season, to serve for its support in the winter. It is certain, however, that our European acts are carnivorous in their habits. Says the Rov. J. G. Wood: "Ants do not, as has been frethe Rov. J. G. Wood: "Ants do not, as has been frequently said, lay up stores of corn for the winter, for they are in a state of torpidity during the winter months, and require no food. Moreover, an ant would find as much difficulty in eating and digesting a grain of corn as we should in devouring a truss of straw." Colonel Sykes, however, observed an ant in India that laid up a large store of millet-seed; and it is possible that other species may have the same habit. The avegatable substance which arts approachies to The vegetable substance which ants appear chiefly to use as food, is sugar, and to this, wherever it is to be found, they seem to be guided by a very scute sense of smell. Honey-dew, the saccharine excressence of the aphides, is a favourite food of many species. Not only do the ants climb plants on which aphides are to be found, but should they find the creature and not be round, our should nev and the creature and not his accularine produce, they will, with their antennas, pat the aphis on either side of the abdomen until the desired drop is yielded, and them pass on to snother. Linnæus quaintly styles the aphis the ant's mile-com. It is even related that the ant seems to regard the aphis as the partial or prepared to aphis as his particular property, and is prepared to do battle to the death with any other ant that seeks to dispute its title; and that the Aphie radicina, which derives its food from the roots of grass and other plants, is not uncommonly taken into custody by the yellow aut (Formica flava), and maintained in its nest, yeard watt [Formeta junua], and manusanea are usus, as a farmer might procure a herd of sows and house them in his sheds. That these stories are beyond distinct pute is not insisted, still, when the wonderful instinct of the ant is considered, it is too much to reject them

Ant as altogether incredible. Indeed, it should be sufficient to flud Huber among those who mention this farmer-like habit of the aut, to entitle the statement to serious consideration. The habitations of anta are very curiconsuceration. The nativations of same are very currously constructed, and display great ingentially. House built by the common wood-aut (Formica rufa) are sometimes as large as a small haycook. They are generally found in the vicinity of some large tree on the bank of a stream; such a site affording them both the solution and the same of the built. the bank of a stream; such a size affording them both food and the moisture requisite for building purposes. The ant-hill is of a conical shape, and composed of leaves, scraps of wood, earth, &c. - At the commencement the nest is simply an excavation made in the earth; a number of the labourers wander about in quest of materials suitable for the superstructure, othersecarry out particles of earth from the interior. which sire replaced by the bits of wood and leaves other labourers bring in, and which the builders pro-perly arrange. Care is taken that space is left for the galleries that lead to the interior, while the dome contains a number of spacious spartments communicating with each other by means of galleries similarly con-structed. To the superficial observer the exterior of an ant colony presents the appearance merely of a careless heap, the result rather of chance than of design. Minute inspection, however, would invariably discover it to be the very perfection of architecture, in which the attacks of enemies, the effect of wind and flood, and the rays of the sun, have been thoroughly provided against in the building. Ants are very pugnacious, and often fight fiercely. Party meets party, nacious, and often fight fiercely. Party meets party, and after the fray may be found limbless trunks, and trunkless heads, and combatants fast locked in each other's embrace, and quite dead. More extraordinary than all, however, is the fact that some species of ants go on regular forays to carry off the eggs and grubs of other species, which they carry into captivity, and rear as bond ants and slaves for the rest of their lives. The best known of these marauders are the Sanguinary Ant (Formica sonquinea) and the Amazon Ant (Formica rufesoens). It has been noticed as a rather singular circumstance, that in both cases the kidnappers are red or pale-coloured ants, and the captives jet black. The tyrants march forth attended by scouts, and when the unsuspecting colony of negro ants is reached, there ensuses a tremendous fight, in which the negroes are certain to be worsted. Thereupon, the conquerors assail the now undefended aut-hill, rend its walls with their powerful mandibles, seize the pupe in their mouths, and march home again in triumph. The slaves are not ill-treated, but live as do human slaves, the only reward for the labour of their lives being such food and lodging as their masters please to bestow .-- Ref. Gould's English Ants; the works of Baron de Geer, Huber, Latreille, Kirby and Spence's Entomology, &c.

ANT, WHITE, in Zool., an extensive and important fam. of the Neuron and

ART, Water, in Zool., an extensive and important fam. of the Neuropterous ord., chiefly confined to the tropics, where they perform no inconsiderable share in the necessary business of removing from the earth's surface the carrion that cumbers it. Like the common ant, the white ants live in communities, and are, like them, omnivorous. Like the familiar "little brown ant," too, the white tropical insect is, at a certain period of its existence, furnished with wings to expedite its amigration. At no time, however, does the general form of the two insects agree. The autenms of the white ants are thread-shaped, and composed of about twenty joints, and the eyes are rather small, but prominent; the body is depressed, and the mouth very similar to that of the Orthoptera, with the four-eleft lower lip, the wings alightly transparent, and the legs short. As destroyers, they certainly deserve place eaxt to the locusts. Should they attack a building composed wholly or partly of wood, it is doomed;—truly, when they leave it, as being of no further use to them, it will not have altered much in appearance; but examination will discover the substantial beams to the mere shells, and the pillars as hollow and unstable as reeds. Your gun that haugs against the wall will drop barrel from stock at the slightest handling, and your sword show itself naked, through its leather sheath being eat up. Nothing is safe from the white shrets insatiable appetite. Their tactics in attacking a building are very peculiar. While some of them are busy gutting the timbers that support it, others ascend from

them, entering a rafter or some other part of the roof, in search, as it would seem, of the thatch, which they appear to relish more than any other portion of a house. If they find it, they bring up wet clay, and build galleries through the roof in various directions as long as it will support them. In this manner a wooden house it speedily destroyed, and all that is contained in it is, at the same time, subjected to their ravages. Those won-derful edifices known as ant-hills are built of earth or sand agglutinated together. When Dr. Livingstone was engaged in his first African exploration, he witnessed several instances, not only of this mysterious insect architecture, but also of the important part they play in the scheme of nature. He tells us that the country between Linyanti and Seshella is flat except patches elevated only a few feet above the surrounding level. "There are also many mounds, where the gigantic ant-hills of the country have been situated, or gigana ant-mis of the country use open structed, or still appear. These mounds are evidently the work of the Termites. No one who has not seen these gigantic structures can fancy the industry of these little labourers. They seem to impart fertility to the soil which has once passed through their mouths; for the Makolo find the sides of the ant-hills the choice spots for rearing early maize and tobacco. In the parts through which we passed, the mounds were generally covered with wild date-trees." The fecundity of the female of this species is truly wonderful. She and her partner are incarcerated in a cell by the neuters, and are there regularly supplied with food; and, after impregnation, on the enlargement of the evaries, her abdomen swells to the enormous size of nearly two thousand times the rest of her body. As soon as she begins to lay eggs, they are conveyed away by the neuters to the prepared cells, which, in conjunction with the magazines of provisions, occupy the interior of their nests. It is said that she lays as many as 80,000 of these eggs in the course of twenty-four hours. So marvellous a fecundity would speedily overnours. So marvenous a lectuality would speedily over-whelm the earth, did it not happen that-comparatively few reach maturity, and that birds beasts, and fishes devour them in shoals. The true ants, however, are their worst enemies, and prey on them with the most savage voracity, especially at the period of their swarming. When roasted, they are said to be palaswarming. When roasted, they are said to be pass-table as food, and as such to be highly esteemed by the natives. A Bayeye chief, who paid a ceremonial visit to Dr. Livingstone's camp, was offered some bread and apricot jam. "Did you ever est anything so good?" inquired the doctor. "Ah!" responded the chief, "you should try roast white ants."

ANTACID, intras-id (Gr. onti, against, and acid), a term applied to such medicines as possess the quality of correcting acidity or sourness in the stomach. The principal antacids are potash, soda, magnesia, lime, and their carbonates.

and their earbonates.

Antagonist Muscles, in-ligi-o-nist (Gr. anti, against; against; againstes, a combatant), in Anat, are those muscles which act in opposition to each other; as flexors and extensors, abductors and adductors. In the arm, for example, the flexor muscles bend the limb back or extend it in a direct line. The lexor and extensor muscles set antagonistically towards each other, not in efforts at simultaneous and contrary action, but in consecutive action of an opposite direction. There is, however, a sort of passive action in the different muscles of the body, constituting what is termed the natural tone of the system; and when this is lost or partially enfeched in one set of muscles, their natural antagonists have an undue position of the natural balance. The form and position of the muscles of the face, for instance, keep up a balance of feature in the natural expression of immobility or stillness; those of one side antagonist those of the others. In paralysis of one side of the face, the muscles of that side are deprived of their natural tone and power of action, while those of the other side of the face retain their tone and power as before; the consequence of which is, that the latter draw the month to their side of the face, while the others are unable to counterbalance this action by their want of tone and power to act in the opposite direction. These muscles hence possess a counterbalancing power,

#### Antalgic

active in a state of immobility, and a moving power in opposite directions during the movement of the parts to which they are fixed.

parts to which they are fixed.

ANTAGEC, da-till-jik (Gr. anti, against, and algos, pain), in Med., a term applied to that which relieves pain.

ANTALKALI, "int-" all-" k" - l" (Gr. anti, against, and alkali), a name applied to such medicines as tend to counteract the presence of alkalies in the system. The antalkalies in most common use are muriatic, nitric, and eitric acid.

ANTINACLASTS, änt'-ăn-ă-klai'-sis (Gr. antanaklao, I. driva back), în Rhet., is a term denoting the repetition of a word in a different sense, or as a different part of speech, from that in which it has already been employed, in order to attract attention or give expressiveness to the phrase; as, "Whilst we like, let us like." It is also the returning to a subject after a long parenthesis, by repeating, in the same words, part of what went before.

ARTANAGGE, ant'-an-a-gaje (Gr. anti, against, and anagoge, the bringing up), a figure in Rhet, applied to the case of an opponent, when not able to answer the accusation of his adversary, replying by accusing him of the same or other crimes. It is usually called recrimination.

ANTARCHISM, anti-ar-kism (Gr. anti, against, and arche, government), an opposition to all government or legal restraint.

ANTARCTIC, àn-tark'-lik (Gr. anti, against, or opposite to, and arktos, the Bear, or northern constellation), an expression applied to the south pole and Southern Ocean, as opposite to the north pole and Northern or Arctic Ocean, and especially to the region which lies around the antarctic or south pole, within a circle distant 23° 28' from that pole; corresponding to an area similarly circumscribed which surrounds the north or arctic pole.

ANTARES, &n-tair'-ces, a bright double star in the constellation Scorpio, marked a, and known as Corsorpii, the Scorpion's heart. It is remarkable for its brilliant red appearance.

ANTE, an'-te, a Latin preposition signifying 'before,' and much used in the composition of English words. In composition it signifies before, either in place or in time. The Greek preposition anti is likewise frequently used in composition, and denotes against, opposite, contrary to.

ANT-EATER, GREAT (Myrmecophaga jubula of Linneus).—This curious creature, sometimes called the ant-bear, is an inhabitant of most of the tropical parts of South America cast of the Andes. It is the largest of the edentata, measuring four feet and a half from the tip of the snout to the root of the tail; while the latter member measures nearly three feet in length. These, at least, were the dimensions of the foll-grown female lately at the Zoological Gardens. The head of the great ant-cater extends to a long snout covered with skin, with only a very small opening at the tip for the protrusion of the tongue: its legs, especially the anterior once, very stout and strong, and armed each with four long claws, which turn inwards against the sole of the foot. The hind feet are provided with a broad sole, and it is probably from this circumstance that the anical derives its occasional name of ant-bear. The body is covered with bristly hair, which, on the tail, grows to such a length as to sweep the ground. When composing itself for sleep, the ant-cater curls its body, and so enwraps itself in its bushy tail, as to present the appearance of a heap of withered grass rather than a living animal. It is said that the animal resorts to the shelter of its tail as a protection from the rain, and that the Indians, on overtaking this sort of game, make a rustling among the forest toliage, to resemble the pattering of rain; whereon the ant-cater hasters to wrap itself in its tail, rendering it an easy matter for the stealthy savage to approach and knock it on the head. This precaution is not unnecessary; ior, despite the mimal's harmless appearance, it has a habit of suddenly rising, bear-fashion, and classing its sassilant round the waist, lacerating him rearfully with the power and classing its powerful claws. The natural food of the ant-cater is the white ant that abounds on the banks of lakes.

#### Antelope

nests of the industrious little insects with its heavyarmed fore-paws, it puts the entire colony in confusion, and then thrusting amongst them its nimble tongue, capable of protrusion to the extent of a foot and a half, withdraws the adherent ants into its maw, repeating the operation till they are all consumed, or the ant-cater's appetite satisfied. The ant-cater's tonguo is composed almost solely of ring-like muscles, and is

ANT-RATER.

altogether worm-like in appearance. The surface is endued with a viscous matter, to which the ants and termites become helplessly attached at the slightest contact. Without this providential arrangement, the animal would find subsistence next to impossible, as its mouth is extremely small, and it possesses no teeth. The latter is the case with the majority of the edentata.

ANTECEDENT, ün'-te-ne'-dent (Lat. ante, before, and cedo, I go), in Gram., is the noun which goes before the relative, and to which it refers. In Log., it is that part of a conditional proposition on which the other, which is called the consequent, depends. In the relation of cause and effect, the cause is the antecedent, the effect the consequent.

ANTEGEDENTIA, in the two distributions of any heavenly body appears to be in a direction contrary to the course of the signs of the zodiac, or from east to west, it is said by astronomers to move in antecedentia.

ANTECHAMBER, and te-chaim-ber (Lat. ante, before; Fr. chambre, room, apartment), literally the room before the chamber; that which leads to the principal apartment.

ANTEDILUVIAN, ŏu'-te-di-loo'-vi-on (Lat. ante, before, and .tiluvium, a flood), a term applied to whatever existed or happened in that period of the world's history which preceded the Flood. The length of this period is variously given. According to the Hebrew text, it comprised 1,656 years, being only 692 years less than the period from the Flood to the birth of Christ, or 206 years less than that from the birth of Christ to the present time. The Samaritan and Septuagint texts, and Josephus, however, according to Hales and Jackson, make it no fewer than 2,256 years. All our authentic information respecting this long and interesting period is contained in forty-nine verses of Genesis (iv. 16 to vi. 8), more than half of which are occupied with a list of names and ages, invaluable for chronology, but conveying no particulars regarding the primoval state of man.—Reg. Kitto's Biblical Cyclopadda.

the shelter of its tail as a protection from the rain, and that the Indians, on overtaking this sort of game, make a rustling among the forest toliage, to resemble the pattering of rain; whereon the ant-eater hastens to wrap itsel in its tail, rendering it an easy matter for the stealthy savage to approach and knock it on the head. This precaution is not unnecessary; for, despite the animal's harmless appearance, it has a habit of suddenly rising, bear-fashion, and clasping its massailant round the waist, locerating him earfully with sassailant round the waist, locerating him earfully with the powerful claws. The natural food of the ant-eater is the white ant that abounds on the banks of lakes and rivers in tropical South America. Assailing the

88

# Antelope

remarkable for their delicate sense of smell. It has been supposed that this is owing to their possession of "lachrymal sinuses," or "tear-pits," and that these organs communicate with the nostrils. The anatomy of the parts fully proves that this theoryis incorrect, and that there is no internal communication between the lachrymal sinus and the nose. Although the antelopes are not the only animals which possess suborbital sinuses, they are the only members of the hollowhorned family that exhibit this character. The females are furnished with two and sometimes four teats, and the period affects and sometimes four teats, and birth. From the most remote ages, the eyes of this genus have been a peculiar theme. The Greek and Roman name of the gazelle, dorcas, is derived from the verb derkomai, I see. Even the English name of the genus, antelope, is a corruption of the term antholops, literally 'bright eyes.' We are, moreover, informed by Bochart, that the Scriptural name, tabitha, is derived from tzeli, the Heirew name of the gazelle, which alludes to the brightness of its eyes. The same image is

frequently employed by Eastern poets, and also by our modern versifiers, the soft and subdued beauty of the gazelle's eyes often being compared to those of the timid and blushing maiden. As a rule, the hab of the antelope is smooth and short, and of an equal length; but, in some species, they have manes on the neck and shoulders; others, as the gau, are provided with a beard on the throat and chin. The cars are long and pointed, growing in the inside of which are long white bairs, forming five longitudinal lines, with four black spaces between. The tails are short, tufted at the extremity. This genus, as a rule, is gregarious, uniting in large flocks of thousands; but, in some instances, spending their lives in solitary pairs. When associating in large numbers, great caution is taken to prevent surprise, and sentinels are constantly kept on the nlert. Their wariness in this particular, combined with their acute sense of smell and sight, renders them somewhat difficult game, tasking the patience and temper of the hunter to the fullest extent. The hunting-grounds of Africa contain the largest number of these animals, Asia furnishes several species; Europe supplies but a small quote; and the gignitic extent of pasture-land in the New World can boast of but a single species. Australia and Madagascar are totally destitute of antelopes, as of all indigenous ruminants. With regard to the habitat of the antelope, it is far from a uniform nature; the general characteristics are as variable as the structure of the animals. While some species delight in the parched and arid desert, feeding upon such bulbous plants as the nature of the soil affords, others find a home on the open plains, on the steppes of Central Asia, or karroos of Southern Africa. Another species prefers the mountainous districts, and exhibits all the ease and sgility of the wild goat in their rocky home.

## Antholmintics

The dense and mighty forests of tropical Africa pro The dense and mighty forests of tropical Africa provide a home for some other species. The whole of the antelopes were at one time included under the general head Antilopea. Modern discoveries have so largely augmented the group, that it has been necessary to class them into subdivisions, as follows:—I. True antelopes; 2. bush antelopes; 3. capriform (or goat-like) antelopes; 4. bovine (or ox-like) antelopes. The two great divisions into which they are divided are, the antelopes of the field and the antelopes of the feed. desert. They are principally distinguished in the former by the absence of hair on the nostrils, whilst the same organs of the latter division are covered within with hair or bristles. It is true, the subdivisions have been quadrupled by modern zoologists; but, as an eminent authority remarks, "the genus antelope has become a kind of zoological refuge for the destitute, and forms an incongruous assemblage of all the hollow-horned ruminants together. So diversified are its forms, and so incongruous its materials, that it presents not a single character which will either apply to all its species, or suffice to differentiate it from conter-minous genera." The antelope would appear to be minous genera." The antelope would appear to be the connecting link between the deer and the goat. the connecting link between the deer and the goat. In the peculiarity of never shedding their horns they resemble the goat; on the other hand, their fleetness, the colour and texture of their hair, their general structure, in fact, would place them near the deer tribe. The general colour of the antelope is brown on the back, and white under the belly, variegated with black stripes. With regard to the size of the antelope, while one of the largest suscing are some flyeor as while one of the largest species are some five or six feet in height, there is a singular little variety,pigmy antelope, which scarcely measures nine inches. The whole tribe amount to about eighty species. Antelope flesh forms a considerable portion of the native's larder, as well as affording food to some thou sands of the carnivora. In cases of severe drought, they have been known to sweep down on the cultivated fields of the colonists in such flocks as to cause fearful devastations.—Ref. English Cyclopædia-Nat. Hist.

ANTELUCAN, an-to-low-kan (Lat. aste, before, and lux, light), before light, a term applied by ecclesiastical writers to things done in the night, especially used in reference to the assemblies of Christians which were held during the night in the early times of persecution.

ANTEMBRIDIAN, un-te-he-rid'-i-na (Lat. ante, before, and meridies, noon or mid-day), before noon or twelve o'clock in the day, used in its abbreviated form A.M. to denote any time between midnight and noon.

ANTENNE, an-ten'-ne (Lat., a yard-arm), in Ent., those slender bodies with which the heads of insects are furnished, being synnonymous with what are called feelers or horns. (See Bre. Insect, &c., for the several varieties of antenne.)—Ref. Kirby and Spence's Introduction to Entomotory.

ANTIFERULT, an'-le-pe-nult' (Lat. ante, before, pene, almost, and ultimus, the last), is used in Gram. to denote the last syllable of a word except twe,—the one before the penult.

Antenion, in tervi-or, before either in time or place. In Anat. it is often used to designate parts which are situated before others, and is thus opposed to posterior; as, the anterior lobes of the brain, the anterior intercostal nerve.

stilercostat nerge.

Antibulity, in-the'-lix (Gr. antihelix, from anti, opposite to, and helix, a spiral), in Anat., is an eminence on the cartilage of the ear, situated before, or more properly within, the helix, or outer circle of the ear. It consists of two ridges as its upper part, which unite as they descend.

as they descend.

ANDELMINICS, ân-thel-min'-tike (fir. anti, against, and elmius, a worm), a term applied to such modicines as have the effect of destroying worms in the stomach and intestines. They are of various kinds, but may be divided into three classes,—those which, by increasing the peristaltic motion of the intestines, tend to displace the worms, and may thus occasion their expulsion,—as purgatives of various kinds; those which tend to strengthen the stomach and intestines, and the system generally,—as tonics or analeptics; and those which set specially upon the worms, dislodging, weakening, or killing them. These last are anthelminities, properly so called. Of this class, the oil of turpentine is generally the best medicine that can be employed, and is,

# Anthem

perhaps, the only one that unequivocally acts as a direct poison on the worms.

ATTHEM, an them (Gr. anti, against, and humnes, a hymn), properly eignifies hymn sung in alternate parts, as being anciently sung alternately by the two sides of the choir. At present the name is applied to a species of musical composition, introduced into the service of the English church in the beginning of the reign of Queen Elizabeth, the words being taken from the Psalms or other suitable portion of the Scriptures or Liturgy. There are three kinds of anthem,—solo, verse, and full authem. The solo anthem has only one voice to a part; the verse consists chiefly of chorus, but there are also verse parts for single voices; the full anthem is

wholly chorus, and sung by all the voices; the full anthem is wholly chorus, and sung by all the voices. The anthem can only be heard to perfection in cathedral service.

ANTHEMIS, in the mis (Gr., the Chamomile plant), in Bot., a gen. of plants belonging to the nat. ord. Composite, sub-ord. Tublishora, and distinguished by having the scales surrounding the flower-heads members with the headers like these of a heaver-themselve the headers. branous at the borders, like those of a chrysanthemum, from which genus it, in fact, differs chiefly in the re-ceptacle of the flower being furnished with little chaffy projections. The most important plant of the genus is A. nobilis, the common chamomile, which is extensively cultivated for the sake of its flowers. It is an indi-genous perennial, flowering from June to September, and growing on open gravelly pastures and commons. The capitula, which are commonly termed flowers, are each composed of a number of tubular yellow florets, arranged on a receptacle, and surrounded by a circle of ligulate white florets. The double variety is produced at the expense of the tubular florets, which The single become converted into ligulate florets. flowers are to be preferred for medical purposes, as the central yellow florets contain much more volatile oil than the white ones. Chamomile is cultivated for the London market at Mitcham and in some parts of Derbyshire. Both leaves and flowers possess a strong but not unpleasant aromatic odour, and a nauseous but not unpressant arounder court, and a maneous bitter taste. The principal constituents of the flowers are volatile oil, tannin, and bitter resinous matter. The oil, which is procured by distillation, is stimulant and antispasmodic, and is frequently used in the preparation of tonic and cathartic pills, and to relieve lattlence, griping, and errotation. The dried flowers have the same properties as the oil, and are used for the same purposes. They are also complexed extendity the same purposes. They are also employed externally for fomentations. The chamonile flowers of the German pharmacologists are the produce of a species of Matricaria, a genus very closely allied to the Anthemis. On the continent A. nobilis is called the Roman chamomile, to distinguish it from M. Chamomilla, which is there generally known as the common chamomile. Two other species of Authomis may be noticed,—A. Cotala, the May-weed, a common wild plant, sometimes mis-

taken for the chamomile; and A. tinetoria, which yields a yellow dye, much used in France by the dyers.

ANTIER, öx'-ther (Gr. antheros, belonging to a flower), in Bot, an essential portion of the stamen, being the bag or case (e) which contains the pollen. It is generally supported on the summit of a little column or stalk called the filament (d). The pollen is discharged at certain periods through little slits or holes formed in the anther. (See STAMEN.)

Antheridia, an-the-rid'-i-a (Gr. anthos, a flower), in Bot., the general name applied to all the various struc-

tures in which, certainly or probably, the fertilizing function of reproduction resides in flowerless plants, and which consequently correspond physiologically to the anthers of flowering plants. All these organs have one character in common,—namely, that of producing ex-tremely minute bodies endowed with spontaneous motion when placed in water. These moving bodies from the antheridia are called spermatozoids, antherozoids, or spermatic filaments. (See SPERMATOZOIL).

ANTHESIS, ān-the'-sis (Gr., flowering), in Bot. this term is sometimes used to indicate the period at which

the flower-bud opens.

ANTHERS.

## Anthracite

ANTHOCARPOUS, an-tho-kar'-pus (Gr. anthos, flower, karpos, fruit), in Bot., a general term for fruite formed by the combination of several flowers. Such ANTHOCARPOUS, ŭn - tho - kar' - pus fruits usually consist not only of the carpels of the flowers, but of their bracts and floral envelopes as well, a fact indicated by the derivation of the term anthocarpous. The terms multiple, aggregate, and collective, have also been applied to these fruits. The most important anthocarpous fruits are, the cone, which is seen in the fir, larch, spruce, and other plants of the order Conjferc; the galbulus, seen in the typress and juniper; the strobilus, seen in the hop; the strobilus in the pineapple; and the sycoms, in the fig. These fruits are described under their respective heads.

ANTIOCEROTE, in-tho-se-ro-te (Gr. suthos, a flower; kirkis, a ray), in Bot, a sub-ord, of the national depotience, the Liverworts, distinguished by having valved pod-shaped sporangin.

ANTHODIUM, an-tho'-di-um. (See CAPITULUM.) Anthology, an-thot-o-je (Gr. authos, a flower, and logia, a collection), in Lit., is a collection of choice but generally in the latter. It is more particularly applied to certain collections of Greek epigrammatic applied to certain collections of Greek epigrammatio poems. Meleager, the Syrian, who lived probably about the middle of the 1st century before Christ, is generally regarded as the first that produced a work of this kind. Subsequently, similar collections were made by Philip of Thessalonica, Diogenianus of Heraclea, Strato of Sardis, and Agathias; but all these ancient works are lost. Many of the pieces, however, are preserved in the later works of Constanting Caphales who lived in the 18th century and Maria. Cephalas, who lived in the 10th century, and Maximus Planudes, who flourished in the 14th. Of the latter, the first printed edition is that of Lascaris, at Florence, 1484. The last edition, with a Latin metrical Florence, 1444. The last edition, with a Latin metrical translation by Grotius, is that commenced by Bosch, and finished by Lennep, in 5 vols., Utrecht, 1795— 1822. In 1696 a manuscript copy of the carlier col-lection of Cephalas was discovered by Salmasius in the Heidelberg library. It was taken to Rome during the Thirty Years war, and subsequently to Paris; but was restored to Heidelberg in 1810. It is much the richer and better of the two, and has been frequently edited. In imitation of the Greek authologies, several Latin anthologies have been made by Scaliger, Pitthöus, Burmann, and others. Oriental literature, particularly the Arabian, is very rich in anthologies.

ANTHOTAXIS, an-tho-tax-is. (See Inflorescence.)
Anthoxanthum, an-thox-an'-thum (Gr. anthos, a ANTIONANTIUM, an-inon-an-inem (vr. anios, a flower, and a aniho., yellow), in Bot., a gen. of grasses. The species A. odoratum is commonly known as the sweet verna; gass, and greatly esteemed for its sweet smell, which causes much of the well-known fragrance

of new-nown hay.

ANTHOZOA, āii'-lho-zo'-ā (Gr. anthos, flower, zoon, animal), a class of that division of the animal kingdom termed zoophytes (animal-flowers). The anthozoa are divisible into three orders, -A. hydroida, A. asteroida, and A. helianthoida. These so-called animal-flowers apparently, but not in reality, combine the animal and vegetable in their nature; for they possess the sense of touch, the power of voluntary motion, and usually feed on matters which they have swallowed or sucked in, digesting them in an internal cavity; thus com-pletely exhibiting the attributes of an animal. (See ACTINIA and ZOOPHYTES.)

Anthracite, an'-thra-site (Gr. anthrax, coal) .- Anthracite, stone-coal, culm, or coal-glance, is a very hard, lustrous kind of coal, found in the lowest parts of the carboniferous strata. It contains 90 to 90 per cent. of earboniceous matter, and burns almost without flame, with a steady glow. Being the oldest of coals, it differs considerably from other kinds. It is nearly devoid of structure, and contains no impressions of plants. Its fracture is somewhat lamellar when broken in the direction of its bed, but irregularly conchoidal when broken across. Some specimens exhibit a beautiful play of colours, and are thence called peacock-coal. play of colours, and are thence called peacock-coal. Being difficult of combustion, from its extreme hardness, it can only be burnt in a strong current of sir. The coke obtained from it is very similar to the original coal both in bulk and weight. It is much used for steam-boilers, and for various metallurgical operations, where a strong current of air is easily procured, and an

### Anthracotherium

intense heat is required. Anthracite is very abundant in the Weish coal-field, where excellent qualities are found. It also occurs in enormous quantities in North America; but much of it is so compact that it cannot be used as fuel.

ANTERACOTHERIUM, an'-thra-ko-the'-ri-um (Gr. anthrax, coal therion, beast), a gen. of fossil pachyderma-tous animals, that seems to stand intermediate between the river-hog and the hippopotames. The remains of the anthracotheria were first found in the tertiary lignites, or wood-coals of Liguria; hence the name given

to this extinct animal.

to the exunot animal.

Amentatous, an-thris'-kus, in Bot., a gen. of plants
belonging to the nat. ord. Umbelliferæ, and characterized by possessing little or no calyx, with heartshaped petuls bent down at their points; and by producing a fruit narrowed below the short beak, and without any ridges. The species A. vulgaris, the common beaked parsley, grows wild in waste places, and is sometimes confounded with homlock, but may be easily distinguished by its paler colour, the slight hairiness of the leaves, and by the absence of spots on the stem, and the swelling under cach joint. The species A. cerefulium, the garden chervil, was formerly cultivated as a potherb. A. sylvestris, the wild chervil, is a common weed in hedges and banks throughout England.

mon weed in hedges and banks throughout England.
ANTHROPOLITE, in-throp'-o-life (Gr. anthropon, man, lilhos, stone), in Geol., a torm which has been applied to the petrilled human bones from Guadaloupe, and elsewhere. "These remains," says Mr. Fago, "can scarcely be considered fossil, or even sub-fossil; but must be regarded in the sams light as any recent petrifaction produced by the action of calcareous retains."

waters.

ANTIROPOLOGY, in-thro-pol'-o-je (Gr. unthropos, man, and logos, a discourse), is the name of that science which in its widest sense treats of human nature both physically and mentally. It thus includes anatomy, physiology, psychology, ethnology, and even history, theology, asthetics, &c. It is often, however, limited to the relations existing between the soul and body in man. This science has been little cultivated among us; but it is otherwise in Germany.—Ref. among us; but it is otherwise in Germany.—Reft. Kant's Anthropologic in pragmatischer Hissicht, 4 edf., by Herhart, 1833; Staffen's Anthropologic, 1822; Burdach's Anthropologic für das gebildete Publicum, 1837; Birnbaum's Lehrbuch der Anthropologic, 1842.

Antingoromorphism, ün'thropologic, 1842.

Antingoromorphe, form or shape), literally signifies the representation of human form, and in theology, is used to denote those conceptions of the nature and attributes of God. which we form and express by words

attributes of God, which we form and express by words derived from human or terrestrial qualities or objects. As finite beings, it is impossible for us to form true conceptions of what is infinite; we can only judge and speak of it from what we find within and around us ence we read in Scripture of the eye, ear, hand of God, as well as of his remembering, forgetting, &c. It was necessary that the divine revelations addressed to mankind should be clothed in language adapted to their inferior capacities; but it is orident that it is necessary to guard against being led into too gross and material notions by such language.

Anthropomorphith, an'-thro-po-mor'-fite, a sect of succent hereties, called also Andreans, which arose in the 4th century, and, taking everything spoken of God in Scripture in a literal sense, especially that passage in Genesis where it is said that "God made man after his own image," maintained that God had a human

Anthropopuagi, un-thro-pof-u-ji (Gr. anthropos, and phago, 1 eat), cannibals, or man-caters. (See Canni-

BALS.

hannythins, än-thiv-lis (Gr. anthos, flower, hulos, beard), in Bot, the kidney vetch, a gen. of plants belonging to the nat. ord. Leguminosa. The silky appearance of the heads of flowers suggested the botanical name. A. Vulnevaria is recommended as a herbage plant by some writers on agriculture.

ANTIREN, an'ti-a-rin, the poisonous principle of the upas-tree (Upas antiar). It is extracted from the gum resin of the tree. Introduced into a wound, it

brings on violent comiting and convulsions.

ANTIARS, int. ti. in. in. Bot., a gen. of plants belonging to the nat. ord. Artocarpacea. The species A.

# Anti Corn-Law League

toxicaria is the celebrated antajar, or upas poison-tree of Java, concerning which many fabulous and absurd stories have been told by travellers. (See Uras.) The borles have been toke by craveliers. Local Vess. All bark of A. excidence, a tree growing in India, is used for cordage and matting. Sacks are also manufactured from it by a very simple process. A branch is out corresponding to the length and diameter of the sack wanted. It is soaked a little, and then beaten with wanted. It is soaked a little, and then beaten with clubs till the liber separates from the wood. This done, the sack formed of the bark is gradually turned inside out and pulled down, as the wood is awn off in slices. A thin slice is left to form the bottom of the sack. These bark sacks are commonly used for carrying rice.

ANTI-ATTRITION, an-ti-at-trish'-un (Gr. anti, against; Lat. attritio, a rubbing, wearing away), black-lead mixed with four times its weight of tallow or fat. It is

used to prevent friction in machinery.

Antibuugers, ün-ti-bur-gers, were a sect of Scottish Presbyterian dissenters, who differed from the established church chiefly in matters of church government. They differed from the Burgers, with whom they were originally united, regarding the lawfulness of taking the burgess oath. They have since become united with various other sects of dissenters into what is known as the United Presbyterian Church.

ANTICHLORE, or ARTICHLORINE, "in-ti-klo'-rine.— Sulphate of soda has lately become a commercial product under the above name, and is much used to clear bleached fabrics from any excess of chlorine that may remain in them. The chlorine in the presence of water seizes on an atom of hydrogen, leaving the remaining atom of oxygen free to join the sulphurous acid of the salt to form sulphute of soda. It is occasionally used us a deoxidizing agent in analysis. Hyposulphite of soda is also extensively employed as an antichlore, and

acts in a similar manner as the sulphate.

ANTICHEIST, and ti-kriste (Gr. anti, against, and Christos, Christ), literally signifies the opponent or adversary of Christ, and is the name given to the great enemy of true religion, who is to appear before the second coming of Christ. The name only occurs in the First and Second Epistles of St. John, where it is said that every spirit that confesseth not that Jesus Christ is come in the flesh, is that spirit of antichrist, whereof ye have heard that it should come, and even now already is it in the world. Antichrist is generally regarded, however, as "that man of sin" spoken of by St. Paul as "the son of perdition who opposeth and exalteth himself above all that is called God, or that is worshipped; so that he as God sitteth in the temple of God, showing himself that he is God" (2 Thess. ii.); and the beast spoken of by St. John in the Apocalypse as a beast rising out of the sea and making war upon the saints, with seven heads and ten horns, and ten crowns upon his horns, and upon his heads the name of blasphemy. False teachers are sometimes called antichrists. Protestants generally hold that the Roman Catholic church is antichrist.

ANTICIMAX, an-ti-kli'-max (Gr. anti, and klimax, gradation), in Rhet., denotes a sentence or discourse which descends from grant to little to

graduon), in thet, denotes a senence or discourse which descends from great to little, being opposed to climax, which ascends from little to great.

ANTICLINAL, än-ti-kiv-nil (Gr. anti, opposite, kim, I bend), in Geol., this term is applied to strata which dip in opposite directions from a common ridge.

This ridge is turned an anticline, or saddlebach 1.5. This ridge is termed an anticline, or saddleback.

SYNCLINAL.)

ANTI COEN-LAW LEAGUR was a league formed of the various existing anti corn-law associations, at a meeting held at Manchester in 1839, with a view to bring about a repeal of the corn-laws. A central office was established at Manchester, lecturers were employed, and publications issued, advocating their view; and great public meetings were held at various times in Manpublic meetings were neight various times in Mani-chester, London, and other places. Large sums of money were also raised for the purpose of bringing about free trade in corn; and, at a great meeting in Manchester in December, 1845, it was proposed to raise a quarter of a million sterling. The passing of the bill for the great of the dark of corn, however, and defended for the repeal of the duty on corn, however, rendered this unnecessary, and the league was formally dissolved on July 2, 1846. The efforts of Mr. Cobden in this cause were rewarded by a national subscription amounting to neurly £80,000.

#### Antidote

ANTIDOTE, in'-ti-dote (Gr. anti, against, and dotes, given), in Med., is a term applied to remedies or preservatives against sickness; but more strictly to substances which counteract the effects of poison.

ANTI-FRIOTION WHERLS, in-ti-frik'-shun, small wheels used in machinery to prevent the grinding or rabbing of surfaces moving in contact with each other. They are placed between the surfaces, and are sometimes fixed in axles, but more frequently left to run free. The wheels of castors and carriages are to all intents friction-rollers in principle. (See WHELLS).

ANTIMONIOUS ACID. (See ANTIMONY.)

ANTIMONY, in'-ti-mo-ne, in Chem., symbol Sb, from

ANYIMONYO, ACID. (See ANYIMONY.)

ANYIMONY, ar'-ti-mo-nc, in Chem., symbol Sb, from the Latin stibium; atomic weight 129, specific gravity 6.7. Antimony is a brilliant bluish-white metal. It uses at 850° F. It is so brittle, that it may be reduced to powder by being pounded in a mortar. It occurs in commerce in crystalline cakes, and is generally very impure. It volatilizes at a red heat. It is a bad conductor of electricity and heat. When heated in air, it burns, and gives off copious white fumes, consisting of teroxide of antimony. It is also oxidized by nitric and sulphuric acid, and dissolved by aqua regia. In its chemical relations, it is allied to nitrogen, phosphorus, and arsenic, and forms, with the last, one regia. In its chemical relations, it is allied to nitrogen, phosphorus, and arsenic, and forms, with the last, one of the connecting links beween the metallic and non-metallic elements. It forms three oxides, viz.,—1. Teroxide of antimony, SbO<sub>2</sub> a greyish-white powder, which is procured by boiling the metal with sulphuric acid, and evaporating to dryness, which gives the anhydrous form, or by adding carlionate of soda to a solution of the terchloride. 2. Antimonic acid, SbO<sub>2</sub>, and wellow powder taxtless and insoluble made. a pale yellow powder, tasteless and insoluble, made by adding nitric seid to the tersulphide, and driving off the excess of nitric acid by heat. Antimonic acid forms definite compounds with the alkalies and some of the metallic oxides. The pigment known as Naples yellow is an antimoniate of lead. 3. Antimonious acid. If antimonic acid be heated strongly, a compound is produced containing antimonic acid combined with produced containing antimonic acid combined with teroxide of antimony. This is erroneously called an acid, but it is really either a tetroxide of antimony or an antimoniate of antimony, i.e., either SiO<sub>4</sub> or SiO<sup>4</sup>; SbO<sub>5</sub>. Terchloride of antimony, or butter of antimony, SbCl<sub>5</sub>, is formed by heating the tersulphide with hydrochloric acid. It is very deliquescent, and forms a buttery mass, whence its commercial name. It is used as a caustic by veterinary surgeons, and for browning gun-barrels. It also forms a pentachloride, SbCl<sub>5</sub>. Tersulphide of antimony occurs native in grey lead-coloured masses, and is the only ore from which antimony is procured. It is much used for adulterating coloured masses, and is the only ofer from when antimony is procured. It is much used for adulterating common plumbago for lead-pencils. It may be easily detected by heating the lead, when the sulphur soon renders its presence apparent, or by the mark on paper being ineffaceable by India-rubber. It is used in pyrotechny for making Bengal lights. The hydrated tersulphide, mixed with the teroxide, is an amorphous red powder, and is used in medicine under the name of Kerme's mineral. Antimonuretted hydrogen, 8bH<sub>3</sub>, is formed when zine and antimony are heated with sulphusic acid. It is supposed to be an ammonia, correpartial acid. This supposed to be an administration sponding to PH<sub>8</sub>, phosphamine. Turtrate of antimony and potussa, or tartar emetic, is a valuable medicinal remedy. It is used in small doses as a sudorific and expectorant; in large doses, as an emetic. It is also used in eruptive fevers, and is a frequent and valuable remedy in catarrhal affections, as it induces the secretion of fluids on the surfaces of all mucous membranes. The Glass, Crocus, and Liver of Antimony are impure oxysulphides, and are formed by reasting the native tersulphide with access of air. The native tersulphide

tersulphide with access of air. The native tersulphide is called in commerce antimony, the metal being called in commerce antimony, the metal being called regulate of antimony. The compounds of antimony are easily recognized in solutions, by giving a characteristic orange precipitate with sulphuretted hydrogen.

# Antiphrasis

The sulphide is again reasted, and mixed with carbonate of soda and charcoal. On heating this mixture in a crucible, a quantity of the metal is formed at the bottom. The unreduced oxyaulphide which remains on the top is afterwards used for preparing Kermes' mineral. Antimony is never employed alone in the arts; but it forms several very useful alloys. It is chiefly used to harden other metals or alloys, and to communicate to them the power of swelling as they cot, a property extremely valuable in casting type, &c. Type metal is composed of four parts of lead and one of antimony. Music type contains in addition a small portion of tin. Britannia metal is a mixture of brass, antimony, bismuth, tin, and lead, in different proportions. Antibismuth, tin, and lead, in different proportions. Anti-mony was known to the ancients in the form of the tersulphide, and was used by them as a pigment to blacken the eyelids. It was first reduced to the metallic state by Basil Valentine, towards the end of the 15th century.

Antinomians, andi-not-mi-ans (Gr. anti, and nomos, law), in Theol., a name given to such as hold that Christians, being justified by faith, are freed from the observance of moral laws and the performance of good works. This error probably arose from a misunder-standing of the distinction made by the apostle Paul in the Epistle to the Romans, between faith and the works of the law. Various seets arose in the early church who might be termed Antinomians; but the name was first used by Luther at the time of the Reformation, and applied by him to the opinions advocated by John Agricola. The latter afterwards recanted, and, from that time, little has been heard of Antinomianism on the continent. During the time of the Commonwealth in England, certain advocates of this doctrine appeared, and, since that time, the term has been applied by way of reproach to various secta, with little regard to its original or proper meaning. Indeed, an extreme of Calvinism tends to a species of Antinomianism, in so far as religion is considered chiefly as a matter of faith, with little regard to practice,

manifestly overlooking the apostle's doctrine, that "faith without works is dead, being alone." ANTIFEDOBATISTS, ön-li-pe'-do-bip'-tists (Gr. anti, paidos, of a child, and baptizo, I baptize), in Theol., is a term applied to those who object to infant baptism. They are generally known in this country as Baptists.

They are generally known in this country as naphies. (See Bapties).

Antipathy, in-tip-si-the (Greanti, and pathos, feeling), in its widest sense, denotes the natural dislike or aversion which an animate being entertains for some particular object; as the antipathy of sheep to wolves, of a turkey-cock to the colour red. In the human species we frequently meet with remarkable cases of autipathy hy certain individuals to objects which are grateful or indifferent to the generality of mankind. Thus, some have an antipathy to certain kinds of food, as butter or eggs: to certain animals, as toads, mice, spiders; to certain tastes, smells, sounds, &c. In some cases the autipathy is so strong as to produce sickness or fainting. Doubtless, many of these feelings may be traced to early training, as when children are frightened with certain objects, or nauseated with certain kinds of food. But antipathy is not always a conscious caprice which may be removed by an effort of the will, or by habit, for it is sometimes found that the effects of the presence of these objects are manifested on the individual, though their resence was unknown, and that substances for which he feels an antipathy, when partaken of unconsciously, may produce in him exactly the same symptoms as if he had partaken of them the same symptoms as in he man parament of mean knowingly. It is difficult to account for this, except on the principle that there lie beyond the sphero of our consciousness, feelings and impressions which

# Antipodes

ing what we ought rather to affirm it to be; as, 'It did

ang what we ought rather to affirm it to be; as, 'It did not displose me,' meaning, 'I was pleased with it.' Anticones, in-tip-o-dees (Gr. ant, and pous, a foot), is a term applied to those who live on opposite sides of the earth, and, consequently, have their feet turned towards each other. They are in similar but opposite latitudes, and their longitudes differ by 180°; and, consequently, while they have similar climates so far as dependent upon latitude, their seasons, as well as their days and nights, are reversed.

their days and nights, are reversed.

ANTIPOPE, an'-ti-pope, one who assumes the title and functions of a pope without valid election. Antipopes elected by a sovereign, or by a faction, have frequently arisen in the Roman Catholic church, and have led to arisen in the toman Catalone cauren, and nave led to long protracted struggles. The emperors of Germany were the first to set up popes of their own ilomination, in opposition to those that the Romans had elected without consulting them. In many cases, both com-petitors—sometimes there were even three or four—for the papal chair, were equally untipopes, that is, their the papal chair, were equally antipopes, that is, their claims were equally good. Each was frequently supported by whole nations, and the schism was nothing else than the struggle of adverse political interests. During the 12th, 13th, and 14th centuries, there were numerous antipopes; but the most remarkable of these schisms in the Church, is that which took place on the death of Gregory XI., in 1378, and divided and agitated the Church for fifty years. The Italian party elected Urban VII. to the papel their and the French elected Urban VI, to the papal chair, and the French elected Urban VI. to the papal chair, and the French cardinals retired from Rome and elected one of their own number as pope, under the title of Clement VII. The claims of the latter were recognized by France, Spain, Savoy, and Scotland, while Haly, Germany, England, and the countries in the north of Europe, supported Urban. Clement established himself at Avignon, and there he and his successor, Benedict XIII., held their court, while Urban and his successor continued at Rome. The schism caused great scandal in the Church; the two popes excommunicated each other, and did not hesitate to compromise their sacred character by the most cruel outgrees and the grossest character by the most cruel outrages and the grossest insults. At length, a general council was held at Pisa in 1409, when both Gregory XII. and Benedict III., the successor of Urban, were deposed, and Alexander V. elected in their stead. Peace, however, was not established till the council of Constance in 1415, when all the three popes were deposed, and Martin V. elected in their room.

ANTIQUARIES, SOCIETY OF .- The Society of Antiquaries was first established in 1572, when Archbishop quaries was first established in 1512, when Archibsolop Parker, Sir Robert Cotton, and some others, united their efforts for the preservation of the ancient moun-ments of their country. James I. regarding the meet-ings of the society with apprehension, athought fit to dissolve it in 1694, and the society remained in abey-ance till the beginning of the 18th century. In 1707 its operations were resumed, and in 1751 it obtained a charter of incorporation from George II. The total number of members is about 650. Each member pays an entrance-fee of £5, 5s., and an annual subscription of £2. 2s.; or £26, 5s., in addition to the entrance-fee,

to become a life member.

ANTIQUARY, an'ti-qua-re (Lat. antiquarius, from antiquas, ancient), is one who studies and searches after monuments and remains of antiquity, as old medals, books, statues, sculptures, and inscriptions, and, in general, sil curious pieces that may afford any insight into antiquity. In a wider sense, it is one who makes the manners and customs of earlier times a special subject of inquiry, or who deduces history from the relics of the past. Antiquarii was also a name given in the Middle Ages to copies of old books, especially in convents. The keeper of an antiquarium, or cabinet of antiquities, was also styled an antiquities of a place are termed antiquaries, as are also, in Germany, those booksellers who deal in old or after monuments and remains of antiquity, as old also, in Germany, those booksellers who deal in old or second-hand books.

ANTIQUITIES. (See ARCHÆOLOGY.)

ANTI-RATIONALISTS, rāsh'-on-ā-lists, in Theol., a term sometimes applied by way of reproach to such as unduly depreciate the application of reason in matters throat dependent of the state o

# Anti-Trinitarians

they are impossible, and receive that as a chief arguthey are impossible, and receive that as a chief argument of their divine origin; there are others which are smenable to reason, and to be judged of accordingly. The difficulty is to know when reason and when faith is to be the guide, so that the one may not trench upon or usurp the province of the other. Those that unduly magnify reason, making it this chief or only guide, are termed Rationalists; those that unduly depreciate it, Anti-Rationalists.

ANYLERITYLE ANYLERITYLE (For continuous continuous contents of the co

Antierinum, in-tir-ri-num (Gr. cati, similar, rin, nose), a gen. of plants, so named because the flowers of most of the species resemble the snouts of some unimals. A. majus (commonly known as the snapdragon), and its varieties, are popular border flowers, which can be cultivated without trouble in any dry soil. The genus belongs to the nat. ord. Scrophulariacea, the

Figworts.

ANTI-SABBATARIANS, in-ti-nib-bit-toip i-ins, in Theol., is a term applied to those that are opposed to the observance of the Christian subbath, on the ground that the sabbath was merely a Jewish ceremonial institution, and consequently abolished by the coming of Christian. of Christ

ANTISCORDUTICS, skor-but-tiks (from anti, against, and scorbutus, a barbarons Latin word for scurvy), in Med., is a term applied to remedies against scurvy.

(See SCURVY.)

(See Scurvy.)

Antiseptics, in-li sep'-like (Gr. anti, against, sepeia, to putrefy), are the means or substances by which the decay or putrefaction of dead vegetable or animal substances is prevented or checked. There are three conditions which favour putrefaction:—I. A certain degree of warmth; 2. air; 3. moisture; by the absence of one or more of which its progress is retarded or arrested. The preservative power of cold is observable in animal or vegetable substances inheaded in the icon in animal or vegetable substances imbedded in the ice; and the packing of fish in barrels with ice is a common means adopted for preserving them. The exclusion of air is another means of checking putrefaction. In this way, means are frequently preserved by being put into tin canisters, which, after the air is carefully extracted, are soldered down. Again, substances may be preserved by the abstraction of moisture; as in plants, dried fish, bacon, &c. The more important chemical autiseptics are alcohol, salt, nitre, alum, crossoto, arsenic, corrosive sublimate, sulphate of copper, and chloride of zige.

ANTISPASMODICS, in fispis-mod'iles (Gr. anti, and

spasmos, a spasm), in Med., are those remedies which are employed to allay or remove spasms or cramp.

(See Spasm.)

ANTISTASIS, an-tis'-til-sis (Gr. anti, and stasis, a position), in Rhet., is a term applied to what is in Latin called comparativum argumentum, and is that species of defence of an action which is founded on the asseror uccence or an action which is touded on the assertion that if it had not been done, worse would have ensued. In this way, a general may defend an inglorious capitulation, by asserting that, except for it, the whole army must have perished.

ANTISTROPHE, in-ti-strot-fe (Gr. anti, against, and strophe, a turning), was a term applied by the ancients

to that part of a song or dance before the altar, which was performed by turning from west to east, in oppowas performed by turning from west to east, in opposition to the strophe, which was performed by moving, from east to west. Hence strophe and antistrophe came to be applied to certain stanzas of an ode, togsther with epode, which was applied to that part which was sung when the chorus stood still. In Gram, antistrophe is applied to the changing of things mutually dependent upon each other; as, 'The master of the servant,' and 'The servant of the master.'

Any returns of the like-sis (Gr. opnosition), in Rhet.

ANTITHESIS, and the servant of the master. ANTITHESIS, an tilh'e-sis (Gr., opposition), in Rhet., is the bringing together or contrasting things that are is the bringing together or contrasting things that are opposed to each other; as in that passage from Giocro, "On the one side stands modesty, on the other impudence; on the one fidelity, on the other deceit; here piety, there sacrilege; here continency, there lust." In the same way, when it was said of a book that it contained much, both new and true, but that the new it contained was not true, and the true was not new. When judiciously introduced, this figure gives vigour and incliness to style; but its froquent introduction becomes tedious.

Anti-Teinitarians, da-fi-trin-i-tair-i-ns, in Theol., are those who deny the doctrine of the Trinity, and

hold that there are not three persons in the Godhead. There have been various kinds of Anti-Trinitarians; but, in the present day, the term is principally applied to the Socinians or Unitarians.

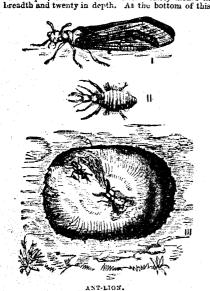

ANTITYPE, dis'-ti-tipe, is a Greek word, literally signifying a figure formed after or corresponding to some other type or figure. A type is a patiern according to which a thing is to be made; antitype is a thing formed according to a model or patiern. In a theological sense, the antitype is that in which a two is fulfilled: which a thing is to be made; enterty to a state of a theological according to a model or pattern. In a theological sense, the antitype is that in which a type is fulfilled; as the paschal lamb is the type of which Christ is the antitype. By the early fathers, the bread and wine in the Eacharist are styled the antitypes of the body and blood of the Land. blood of our Lerd.

the Eucharist are styled the antitypes of the body and blood of our Lerd.

ANTLER, datt-ler, in Zool., the term applied to the horn of the Cervida. Until the deer is a year old, nothing but a slight protuberance marks the places where the antiers sprout. In the second year the horn appears, and is called the brow auther; the next year it has a branch, and is known as the bay auther; the fourth year it has two branches, and is a tray auther; the fifth, another branch and a new name, crockets; and again, at the sixth year, when the antier is perfect, and is called a beam auther. The deer's antiers are shed in the spring; and, considering their size and weight, are renowed in an astonishingly short time. A full-grown stag's horn probably weighs twenty-four pounds; yet this large mass of true bone is reproduced in about ten weeks. The development of the deer's authers is intimately connected with the sexual system. (Sec Deer.)

ANT-LION, ant'-li-on (Gr. murmex, ant, and leon, ion) (Myrmeleon formicalco), an insect of the ord. Neuroptera, celebrated for its wonderful incensity in constructing a pitfall for the destruction of its prey. As soon as the young larves are hatched, they at once set about providing for their future sustenance. This is effected by turning round and round in the sand till a small cavity is made, which, as the

in the sand till a small cavity is made, which, as the animal increases in size and strength, grows broader and deeper, till it measures about thirty inches in

pit the ant-lion patiently remains, till some unsus-poeting insect, arriving at the edge of the trap, thinks there can be no harm in exploring it. The sides of the pit, however, are so arranged as to afford foothold not even to the timest insect, and down rolls the little victim into the trapper's clutches; or, should it mani-fest any intention of escaping, a shower of sand,

thrown up by the ant-lion, at once arrests its progress, and brings him tumbling to the bottom again. It is entirely on the juices of insects that this worscious creature lives. The empty carcases are not allowed to creature nees. The empty carcases are not answed to encumber his abode. As soon as he has exhausted their fluids she balances them in his atrong jaws, and tosses them out. The larva remains in this condition during two years; at the end of which time, having attained its full growth, it spins a cocoon, and takes the above the above the characteristic form. the chrysalis form. Three weeks afterwards, it emerges a perfect insect. The ant-lion is, when full-grown, a perfect insect. The ant-lion is, when full-grown, about half an inch in length, and somewhat resembles the dragon-fly, except that it is much smaller. It has a very large abdomen and a very small head, which, however, is furnished with a pair of formidable incurved mandibles: It has six legs, but is incepable of rapid locomotion, and generally moves backwayds. The perfect insect deposits its eggs in dry sandy situations, when the young larvas, immediately after being hatched, begin, as we have seen, to exercise an astonishing instinct in luring insects to their doom. The Muraleon formicales is not found in England. The Mymeleon formicaleo is not found in England, but occurs in many parts of the continent, as France, Germany, Spain, &c. In the accompanying illustration are shown—I. The perfect insect; II. The larva of the insect; III. The pit of the larva, and an ant being attacked. being attacked.

ANTONOMASIA, ñn-to-no-mai'-si-d (Gr.anti, and onoma, a name), is a term used in Rhet. to denote the substitution of an appellative for a proper name; as when Moses is called the Lawgiver, Aristotle the Stagyrite,

or Shakspere the Bard of Avon.

Antosiandrians, an-to-si-an'-dri-ans, in Eccl. Hist., were a sect of rigid Lutherans, and were so called from their being opposed to the doctrines taught by Osi-ander regarding justification. They held that man is not really made just, but only pronounced to be so; that he is not made essentially, but only putatively

AGRIST, oi'-o-rist (Gr. a, not, and oros, a limit), in Gr. Gram., is the name of an indefinite kind of tense of the verb, which usually expresses past time, but sometimes the present or future.

AOBTA. (See ANATOMY.)

APARTMENTS, a-part'-ments .- (For the law of letting

them, see LANDLORD AND TEMANT.)
APATHY, ip'-a-the (Gr. a, without, and pathos feeding), denotes a privation of iecling, a want of passion or emotion. The uncient Stoics affected an entire apathy, considering it as the highest wisdom to entire aparty, considering it as the highest wiscont to enjoy perfect calminess or tranquillity of mind, incapa-ble of being ruffled, and above the reach of any sense either of pleasure or pain; whilst Epicurus taught his followers to seek happiness in a kind of indolent ease, or freedom from bebour and pain. In the first ages of or treadom from about an pain. In the first ages of the Church, the term apathy was employed by the Christians to express a contempt for all earthly concerns,—a state of mortification such as the Gospel prescribes. Clemens Alexandrinus, in particular, brought it greatly into use, expecting thus to draw to Christianity the philosophers who aspired after such a sublime pitch of virtue.

APATITE, üp'-ü-tile (Gr. aputaa, I deceive).—Apatite has received its name from the fact that it is continually mistaken for beryl, fluor spar, and several other minerals, according to its colour and lustre, which vary considerably. It crystallizes in hexagonal prisms, modified sometimes on the edges, at others on the angles. It is a scarce mineral in England. Fine spe-cimens are found in Moravia, Bohemia, and Saxony. It is a triphosphate of lime, combined with a variable quantity of fluoride or chloride of calcium.

APAUME, or APPAUME, a-pome' (Fr. a, and paume, palm of the hand, in Her., means a hand, showing the palm extended, with the thumb and fingers at full length.

APE, aip (Pithacus of Linneus), a gen. of quadrumanous (four-banded) manmalis, a class of animals which, commonly speaking, are divided into four sections:—Apes, or such as are destitute of a tail: baboons, or such as have muscular bodies, elongated muzzles, and whose tails are unable chart. muzzles, and whose tails are usually short; monkeys, whose tails are in general long; and sopajous, or monkeys with prehensile tails, which can at pleasure be twisted round any object. (See MONKEY.) According, how-

### A.peak

ever, to the scientific coological definition, the gen. Ape, or Pithacus, comprehends only those four-handed mammals whose teeth are similar, both in number and form, to man's, and which have neither tails nor cheek-pouches. The worship of apes and monkeys has

been common among pagan nations from a period of remote antiquity, and still prevails in Japan and India, and certain parts of Africa. An ape's tooth, kept in a temple at Ceylou, was regarded with peculiar revernce, and immense wealth was accumulated through erence, and immense weath was accumulated through the continual offerings of the worshippers; but the temple was plundered and the tooth carried away by the Portuguese, in 1554. (For a notice of the most remarkable apes, see GORILA, OURANG-OUTANG, CHIMPANZEE, &c.; for an account of species, &c., see SIMIADÆ, QUADRUMANA.)

APEAR, a-peck', in Mar., a term implying that the ship's cable is drawn so tight as to bring the vessel immediately over her anchor, which is then said to be

APERISPEUMIC, a-pe-ri-sper'-mik, in Bot., a term synonymous with exalbuminous, which see.

APRTALOUS, a-pel'-a-lus (Gr. a, without, and petalon, loaf), in Bot, a term applied to a flower having but one whori of floral envelopes; in other words, having a calyx, but no corolla. Jussieu named one of his proposed divisions of the vegetable kingdom apetala, and included in it all dicotyledonous plants bearing apetalous flowers.

APEX, ai'-pex (Lat.), the vertex or summit of any thing. Among the Romans it was also the name of a kind thing. Among the Romans it was also the name of a kind of conical cap, worn by the priests, or, more properly, of a small stick, with a tuft of white wool attached, which was fastened to the top of it. The crest of a helmet was also called apex. In Gram, it is applied to a mark placed over a syllable to denote that it is to be pronounced long; especially used when a word has a different meaning, according as it is pronounced long or short; as, in Latin, malus signifies ill; mālus, an appliatice.

APHERESIS, a feer-e-sis (Gr. aphairee, I take sway), is a term used in Gram. to denote the taking away of a letter or syllable at the beginning of a word; as, it's, for it is; 'quinst, for against. A like retrenchment at the end of a word is called apocope.

# Apocalypse

to increase after leaving that position, until it attains its maximum speed at the perihelion, (See Pani-(See PERI-BELION, PLANET.)

APHIDE, if it id (Gr. aphis, a vine-fretter).—These creatures, commonly known as plant-lice, live by sucking the juices of plants, upon which they may be seen congregated in immense numbers. When attacked congregated in immense numbers. When attacked, the plant grows sickly, the leaves curl up, and the fruit of the plant, if not ulterly destroyed, is certain to be seriously impaired. The cultivation of hope is notoriously an uncertain business, and this uncertainty may in great measure be attributed to the prevalence of the hop-fly (Aphis Humuli). So great are their devastations in some seasons, that the amount of duty paid upon hops has varied from £15,000 to £450,000; upon hops has varied from \$215,000 to \$460,000; indicating, of course, a proportional variation in the crop. There is an aphis that particularly affects turnips and cabbages, and one (Aphis vastator) that has earned for itself a world-wide fame,—though it is doubtful if it ever deserved it,—as a blighter of potatoes. Most of the aphidæ are green; but that which attacks the bean (Aphis Fabæ) is black. They have a proboscis, by which they pierce and suck plants, and, at the extremity of the abdomen, two horn-like spines, from which exudes a saccharine fluid called boney-dew. The legs of aphides are long, and they move very slowly. Some are winged, and some are winged, and some are winged, and some are found furnished with perfect-generative organs, are found furnished with perfect-generative organs, found furnished with perfect-generative organs, are tound turnished with perfect generative organs, and the femules lay eggs, which are hatched in the following spring. But, instead of producing insects of both sexes, these eggs give birth only to femules, which, in their turn, produce living young without any congress with the male. The brood thus brought forth again produces young in the same manner; and this goes on throughout the whole summer, without the appearance of a single male insect."—Ref. Dallas's Animal Kinadam. Kingdom.

Aphonia, a first is a deprivation or loss of voice. It is generally occasioned by an affection of the mucles or nerves employed in speech; and its cure is to be effected by removing the disorder from which it proceeds.

Арновіям, af'-a-rism (Gr. aphorizo, I separate), is a maxim, or a short sentence, containing a moral precept or rule of practice, forcibly expressed in few words; as, 'It is always safe to learn from our enemies; seldom safe to instruct even our friends.' It is also applied in Med. and Law to certain truths laid down, but not treated argumentatively; as the aphorisms of but not treated argumentatively; as the appointing of the civil law, &c. It is likewise upplied to a figure in rhetoric, whereby something that has been said is limited or corrected.

APHRITE, āff-rite (Gr. aphros, foam), carbonate of lime occurring in scaly masses, having a peachy lustre and greasy feel; also called foam-spar. This mineral limited to the confidence of the confidence of

must not be confounded with meerschaum (sen-scum),

which is an amorphous carbonate of magnesia.

APHRODITA. (See SEA-MOUSE.)

APIACEE, ai-pi-ai'-se-e, in Bot., a name sometimes given to the nat. ord. Umbelliferæ, which see.

given to the nat. ord. Umbellifera, which see.

Apiari. (See Bres.)

Apiochinite, al-pi-ok'-ri-nite (Gr. apion, a pear), in Geol., this term is applied to a kind of encrimite peculiar to the chalk and colitic formations, and distinguished by a pear-shaped receptacle. (See Encrinte.)

Apis, ai'-pi-um, in Bot., a gen. of plants belonging to the nat. ord. Umbellifera. The common celery, a convectors is the only important species. This

of the nat. ord. Omeetiform. The common ceres, a graveolous, is the only important species. This plant grows wild in almost every part of Europe; but is quite unfit for food until cultivated with absence of light, when the stem and petioles become succulent,

for it is 'guinst, for against. A like retrenchment at the end of a word is called apocope.

APHAINTE, ü-faint! (Gr. a, priv., and phainein, to appear), a tough compact rock, containing hornblende, quarts, and felspar, mixed so intimately as to be impereptible;—whence the name.

APHAINTE, ü-faint! (Gr. apo, from, and helios, the APHAINTE, ü-faint! (Gr. apo, from, and helios, the correction, d-ja'-li-on (Gr. apo, from, and helios, the sun), in Astron., that point in a planet's orbit at which its stits greatest distance from the sun. The rapidity of a planet's motion is least at its aphelion, and begins written earlier, during the reign of Nero. The author-

ahip of this book is commonly ascribed to John the son of Zebedee, and brother of James; but some, cer-tainly not without reason, ascribe it to another John, tainly not without reason, ascribe it to another John, commonly called the Fresbyter. It has sometimes been attributed to the arch-heretic Cerinthus; and hence it has not always been held as canonical. There were certain churches in Greece, as St. Jerome informs us, that did not receive it; and it does not occur in the catalogue of canonical books prepared by the council Laodicea, nor in that of St. Cyril of Jerusalem; but Justin, Irenœus, Origen, Cyprian, Clemens of Alexandria, Augustine, Jerome, Tertullian, and all the fathers of the 4th, 5th, and following centuries, quote the Revelation as a book then acknowledged to be canonical. The controversy regarding it was revived canonical: The controversy regarding it was revived at the time of the Reformation, and Luther expresses himself very vehemently against it. The reformation Geneva, however, Calvin and Bezz, received it as canonical; and these have been followed by Protestants. generally. This book embraces two distinct ranges of -1. The things which then were, or the state subjects :subjects:—1. The things which then were, or the shade of Christianity as then existing in the seven Asiatic churches; and, 2. "the things which should be hereafter," or the constitution and fate of the Church through its several periods of propagation, corruption, reformation, and triumph, from its commencement to its final consummation in glory. The general design of the prophetic part of it is to show the final triumph of Christianity over all enemics and opposers, its universal prevalence in the world for a long series of years, and its termination in an endless period of glory and happiness. "Christianity is, in a manner, personified, and it appears on the scene of action engaged in a contest with the powers of darkness so violent that the struggle must evidently end in the extermination or utter subjugation of one of the parties. Successively, one and another bitter and bloody enemy of the Church one and another bitter and bloody enemy of the Church is overcome; then follows a long period of peace and prospority, during which the influence of Christianity is so widely diffused, that no apparent hostility disturbs it. After this, the powers of darkness renew their assault with exasperated malice and rage; but the interposing hand of Heaven smites them down, and puts a final end to the contest. The peaceful and universal reign of the Christian religion then succeeds, and con-tinues down to the final consummation of the Messianic kingdom on earth, when the resurrection and judgment day introduce a new and perfect order of things, which is to continue through ages that have no end."—Ref. Moses Stuart's Commentary on the Apocatypes. There have been several spurious apocatypes; as those of Moses, Peter, Paul, Stephen, Thomas, &c.; but most of these are now lost.

of these are now lost.

Arocarpous Fruirs, "up'-o-kar'-pus (Gr. apo, separate, karpos, fruit), in Bot., are those fruits which are each formed of a single carpel, but of which several are produced by a single flower. The simple solitary fruits are generally included under the same head; but the most philosophical botanists have kept them distinct. Three kinds of apocarpous fruits are distinguished, and these are respectively termed the Folliche, the Acho-nium, and the Elexio. (See these words.) APOCOREN. (See APRERESIS.) APOCRENIO ACID, äp!-o-kre-nik, an acid found in vege-

table mould, which retains ammonia with great tena-city, thus affording nourishment to the plants in its vicinity. Crenic, geic, ulmic, and humic acids, are found in similar situations, and possess similar pro-

APOCRYPHA, d-pok-re-fd (Gr. apokrupha, hidden, secret), a term used in Theol. in various senses, to denote certain books claiming a sacred character. Among early Christian writers it was frequently applied Among early Christian writers it was frequently applied to anonymous or pseudonymous works. It was also applied to dangerous works, composed by ancient heretics to favour their views, or by Catholics under fletitious signatures. At present, the name is commonly applied to certain books which are not canonical, but which have sometimes been regarded as such, and are generally held as useful for instruction and edification. These books were not received by the Jows as any portion of the Old Testament, and they are not cited or alluded to in any part of the New. either were they regarded as canonical by the early fathers, though they were generally considered worthy

of reverence and esteem, till the council of Trent, in 1545, adjudged that they were to be held as canonical by the Catholic church. At the Reformation, Protestants generally rejected them; but they soon began again to be read in public worship. The Church of England enumerates the spooryphal books in her XXXIX. Articles, as books which "the Church doth read for example of life and instruction of manners, but yet doth it not apply them to establish any doctrine." By the other Protestant churches in England and America. the other Protestant churches in England and America, they are rejected from public worship. The spoery-they are rejected from public worship. The spoery-phal books are, I. and II. Esdras, Tobit, Judith, Esther, Wisdom of Solomon, Ecclesiasticus, Baruth, Song of the Three Children, History of Susaunah, Bel and the Dragon, Prayer of Manasses, I. and II. Maccabees. In fold editions of the Bible, the Apocrypha is sometimes to be seen bound up between the Cd and New Testaments; but not in the recent authorized editions. Besides these, there are a number of other sp-called apocryphal books, which, however, have never hear regarded to a constant. been regarded as canonical. Among these, are the third and fourth books of Esdras, the book of Enoch, the Testament of the Twelve Patriarchs, the Assumption of Moses, the third, fourth, and fifth books of Maccabees, &c. Of the New Testament, there exist a number of spurious gospels, acts of apostles, and epistles. These works have been collected and published by Fabricius, in his Codex Pseudepigraphus Veteris Testamenti, and his Codex Apocryphus Novi Testamenti

Menti.

Apocryphal Controversy arose about thirty years ago, in connection with the British and Foreign Bible Society, and was occasioned by the discovery that part of the funds of the society were expended in the circumstance. culation of the Apocrypha on the continent of Europe On the one hand, this was defended on the ground of expediency; on the other, it was opposed as contrary to the constitution of the society, and to the principles of Christianity. At length, in 1826, the committee of the society resolved, "That the funds of the society be applied to the printing and circulation of the canonical books of Scripture, to the exclusion of those books and parts of books which are termed apocryphal." The controversy, however, was still carried on for some years with much vehemence and acrimony, until the apocryphalists were completely defeated.

apocryphanists were competely deseated.

Apocrymack, d. po-si-nai'-se-c((ir. apo, against, kuon, dog), in Bot., the Dogbane order of dicotyledonous plants, included in the sub-class Corollifore,—trees or shrubs generally having milky juices. The leaves are entire, and destitute of stipules. The callyx is or shrubs generally having milky juices. The leaves are entire, and destrute of stipules. The calyx is 5-parted and persistent; the corolla 5-lobed. There are five stamp as alternate with the lobes of the corolla; the filaments being distinct, the anthers united to the stigms, and the pollen granular. The ovary is composed of two carpels, which are generally merely in contact; when united, they form a 2-celled ovary; styles 2 or 1; stigms contracted in the middle, and expanded at the base and apex, so as to resemble in shape an hourglass, or a dumb-bell; ovules numerous. Fruit sometimes one or two follicles sometimes a capsule, drupe, or berry. Seed very rarely exalbuminous. The Dogbanes are natives principally of tropical regions, as few only occurring in northern latitudes. *Vinca*, the periwinkle, is the only British genus. There are 108 genera and 570 species. Some of the plants of this order are intensely poisonous, and all are to be suspected, though a few yield edible fruit. Some are drastic purgatives, and in some the bark is tonic and febringal. They have usually large showy flowers, and are on that account cultivated in our hothouses. Caoutchouc, or India-rubber, is prepared from the milky juice of several species.

prepared from the minsy pince of several species.

Apocynum, apo, y-unm, in Bott, the typical gen. of
the nat. ord. of plants Apocynacsæ. A. commalismus is
the Canadian hemp, an herbaceous plant from four to
five feet in height, with an unbranched stem bearing
oblong leaves, and cymes of whitish flowers. It yields
are yet with Amazica. oblong leaves, and cymes of whitsh flowers. It yields a very strong fibre, which the Indians of North America employ for making twine and coarse cloth. The roots of this species and A. androsamifolium are emetic, and slightly purgative.

Aponteric, dp-o-dik'-tik (Gr.apodeiktikos, demonstrative), is a term applied in Log. to those judgments or

sheep, goats, and swine. The poultry comprised hens, pigeons, pos-fowls, pheasants, geese, ducks, and swans. Bees were reared, and their honey esteemed a swans. Bees were reared, and their honey esteemed a valuable product on many Roman farms. Of the relative degrees of profit obtained on the various kinds of crops cultivated, Cato has bequeathed to posterity the following judgment:—"If, you can buy 100 acros of land in a very good situation, the vineyard is the first object, if it yields much wine; in the second place, a well-watered garden; in the third, a meion-plantation; in the fourth, an olive-ground; in the fifth, a meadow; in the sixth, a corn-ground; in the seventh, an underwood, or a plantation for yielding poles to train the vine; and in the ninth, a wood where mast grows." Such was Roman agriculture, which, in resilty, differs little from our own practice. We have superior implements, superior varieties of really, samers and from our own practice. We have superior implements, superior varieties of corn, are superior in the management of stock, and in our system of rotation crops. Beyond these, however, there is little difference between the modern English agriculturist and the ancient Roman. They are cared in intelligence in articles. English agriculturist and the amoent Roman. They are equal in intelligence, in enterprise, and perseverance. "What is good tillage?" asks Cato,—"to plough. What is the second?—to plough; and the third is to manure. The other part of tillage is to sow plentifully, to choose your seed judiciously, and in the season to eradicate as many weeds as possible." "Nature," he further observes, "has presented to us two paths which lead to a knowledge of agriculture. These are experience and imitation. Preceding husbandmen, by making experiimitation. imitation. Preceding husbandmen, by making experi-ments, have established many maxims: their posterity generally imitate them; but we ought not only to imitate others, but make experiments, not directed by chance, but by reason." Excellent advice, and wisely delivered !

Mediaval Agriculture. — The darkness which succeeded the fall of the Roman empire in the 5th cen tury, spread itself universally throughout Europe, and agriculture was either neglected, or entirely abandoned for such other modes of subsistence as lawless and for such other modes of subsistence as lawless and troublesome times might suggest. Accordingly, for nearly ten centuries, we know little or nothing of the progress of Agriculture; it then began to revive, first in Italy, and afterwards in Germany, France, and England. There is, however, nothing either useful or interesting to record regarding its advancement throughout this long succession of ages. War was the principal occupation of the various nations of the earth, and it was not till about the beginning of the earth, and it was not till about the beginning of the serious business of tilling these? 16th century that the serious business of tilling the soil seems to have received that degree of consideration to which its importance is entitled. By that time, some steps in advance had been made in Tuscany and Lombardy. In France a tract had appeared, written by a potter, and entitled "Les Moyens de devenir Biche," which contained remarks on rural and domestic seconomy, and which is the first agricultural work produced in France. In Germany, Conradus Heresbachius, who died in 1576, produced his work, entitled "De Re Rustica," which was published at his death, but which gives no information as to the state of agri-culture in his time. This was the first book on agricul-ture produced in Germany; and now that we have arrived at England, a more specific notice of its agri-culture is demanded from us.

English Agriculture.—When Cosar arrived in ancient Britain, 55 B.C., he found that the Cantii and the Belgm. severally inhabiting the modern counties of Kent, Somerset, Wilts, and Hants, cultivated the soil, and used marl as a manure. He also found that they stored used marl as a manure. He also found that they stored their oorn, but in an unthrashed state, only performing this operation when necessity required it of them. These conditions indicate a considerable amount of intelligence; but, besides these, the Roman conqueror found the country well peopled, and abounding in buildings, resembling those of the Gauls, with great abundance of cattle. He also found that they are abundance or nor harm you with that divergence. neither hens, geese, nor hares, notwithstanding that they took great pleasure in breeding them. Whatever were the impressions which his visits to Britain made upon Cæsar, it is to Agricola that its ancient inhabitants were mostly indebted for the improved arts and civilization of the Romans. He reduced them to a state of slavery by refining their pleasures; and, amongst other arts, improved their modes of agriculAgriculture

ture to such an extent as to enable them to store very ture to such an extent as to enable them to store very large proportions of their cereal produce. That this was the case is attested by the fact, that in the 4th century the emperor Julian had stored in granssies which he had erected, such a quantity of tributary corn as filled a fleet of 600 large vessels. Upon this fact, Gibbon, in his "Decline and Fall of the Roman Empire," makes the following comment: "If," says he, "we compute those vessels at only 70 tons each, they were capable of exporting 120,000 quarters; and the country which could bear so large an exportation, must have attained an improved state of agriculture, The early inhabitants of Britain, thus thoroughly initiated into the Roman practice of agriculture, never lost it. Although Saxons, Danes, and Normans, have grafted themselves on the various popumans, have grafted themselves on the various popu-lations of the island, the love of agriculture has still been preserved and followed with an assiduity and enterprise which never was at a greater height than it is at present.

Modern Co

dern Continental Agriculture .ing, the continental countries are far behind ourselves in agricultural practice. In order, however, to convey a general idea of the present state of European cultivation, we will notice the practice as it is pursued by several of those nations which are the most advanced, several of those nations which are the most advanced, and which necessarily devote themselves more to the culture of the earth than those who are in a more backward, and, consequently, in a less comfortable condition. Much instruction, however, cannot be obtained even from a lengthened detail of the various modes of husbardry pursued. All methods are pretty much alike, and even the implements employed bear a considerable resemblance to each other. These circumstances supersede the necessity of our doing more, here, than briefly indicating a few of those agricultural points in which some of the principal followers of the science differ, in practice, from ourselves.

agricultural points in which some of the principal fol-lowers of the science differ, in practice, from ourselves. For the products cultivated in the various countries specified, the reader is referred to the geographical articles in Beeton's Dictionary of Geography.

Flemish Agriculture.—The agriculture of the pro-vinces of Belgium, being founded on their manufac-tures and commerce, and being exempted from those changes to which these are incident, still continues to be the most fruitful source of wealth. The whole of Flanders is cultivated like a garden. Its farmers were our first tutors; and from the middle of the 17th to the end of the first quarter of the present century, the system of Flemish husbandry was a model of neatness and economy. The Flemings were the first among the and economy. The Flemings were the first among the moderns to grow crops for no other purpose than to plough them in when growing, and they follow this practice to a greater extent than any other nation. The system might have been suggested to them by the original barrenness of large portions of their soil, a great proportion of which consisted of harsh and berron sands. Practicing nathing but heath and sou, a great proportion of which consisted of harsh and barren sands, producing nothing but heath and fir. This, doubtless, also suggested the careful collecting of every kind of manure calculated to enrich the earth. "The care of the Flemish farmers," says Murray, in his "Encyclopædia of Geography," "in collecting manure was early conspicuous. The use of liquid manure, collected in large reservoirs, is common to this country, with China, and not known in any liquid manure, collected in large reservoirs, is common to this country, with China, and not known in any other part of Europe, except, perhaps, Norway. Turf sakes, especially those imported from Holland, are in high estimation, and are said to produce an almost magical effect on the vegetation of clover. In general, the Flemish agriculture is conducted on a careful, economical, antique practice, the farmiers not having adopted any modern improvements in the arrangement of husbandry, such as the creasing of the breeds of of husbandry, such as the crossing of the breeds of cattle, and the use of machinery, which have been adopted in England with such happy effect. But this system of agriculture, after supplying the most dense population in Europe with the standard productions of the standard productions of the soil, yields several articles, such as madder, rape,

the soil, yields several articles, such as madder, rape, clover, mustard-seed, hops, &c., for exportation.

Dutch Apriculture.—The husbandry of Holland is almost exclusively confined to stall-leeding and the dairy. This is forced upon the inhabitants by the natural humidity of their dimate. The country, from its geographical conditions, may be considered as nothing more than one great meadow intersected by

### Agriculture

A head

numerous causis, and traversed by rows and groups of numerous canais, and waversed by rows and groups or trees. In summer the cattle are kept grazing con-tinually in the open air, and in winter they are stalled and fed un hay, turnips, &c. Thus the great source of agricultural weath to the Dutch husbandman is the produce of the dairy, which he has brought to such perfection as to have become an object of exportation. Both the cheese and butter of the Dutch enjoy a high reputation throughout Europe.

German Agriculture.—The agricultural population of German y are mostly little farmers or small proprietors, who cultivate the soil with their own hands, and who, in the Teutonic states, form a class called bauer, who, in the removed consequence is, that although farming is pursued with great diligence, it is neither on such an extensive scale, nor with an equal amount of the intelligence with which it is carried on in England. With the exception of some of the mountain districts the form of the mountain districts the form of the mountain districts are the form of the mountain districts. of Salzburg and the Tyrol, where the spade is used, the plough is the universal instrument of cultivation. In the south the ox is the animal employed in tillage, and the horse in the north. In Holstein and West phalia, hedges divide the fields; but in other parts the phalia, hedges divide the nears; one in one possibilities expanse, apparently presenting to the eye an uncircumscribed boundlessness of vegetable fertility and beauty.

Italian Agriculture.—In Italy, the productiveness of the farm is said, by Mr. Forsyth, to be invariably in proportion to the smallness of the property. This is a result the very opposite of that which obtains in England, where, however, there is a less complicated England, where, however, there is a less complicated and more unright system of management than that which exists among the Italians. Whether the recent revolutions may affect the existing forms of copartner revolutions may affect the existing forms of copartnership amongst Italian agriculturists, remains to be seen;
but, at present, the stock of a farm is furnished half
by the landlord, and half by the tenant; and the
produce is divided equally between them. This lease
or contract holds only from one year to another; but if
the tenant pays his rent, and lives in peace, he is rarely
ejected from his holding. The system of irrigation which
obtains in Lorphards and Tusenavi is neglected. obtains in Lombardy and Tuseany is, perhaps, the most remarkable feature in Italian agriculture; and the opulence of these districts is mostly to be attributed opulence of these districts is mostly to be attributed to those works which, at an early period, the genius of the people constructed for the purpose of supplying their soil with water. "The squeducts, sluices, and other works connected with them," says Murray, "are still the admiration of engineers. They are now so divided and subdivided, as to convey the means of irrigative to the still the same of the same of the still the same of the sa tion almost into every field; and in this southern cline, where nothing, scarcely, but water is wanted, the increase of fertility is almost incredible. The produce is sometimes more than tripled; and grass may be mown three, four, and five times in the year." Where water is of so much value, it is natural to suppose that regulations would be imposed for its proper distribation and employment. Accordingly, every newly-lianovared suring is appropriated by the proprietor discovered spring is appropriated by the proprietor of the ground in which it appears, and is immediately converted into a little canel. In the vale of the Arno, irrigation is pursued on a most elaborate system. This is evidenced in the terraces which are formed on the is evidenced in the terraces which are formed on the sides of the steepest mountains, where the naked rock is covered with earth, and where the torrents of the Apennines are confined within walls, and made to render fruitful that which, before, was sterile. Canals now permeate every field, and could only have been made when the Florentine merchants were at the height of their prosperity. These works, at the present day, are maintained and kept in repair at an expense sufficiently great to be felt to press heavily upon the

People.

French Agriculture.—France is said to be the most favourable country in Europe for agriculture, yet are its inhabitants less forward in it than those of Great its inhabitants less forward in it than those of Great Britain. Their implements are, in general, rude, and the operations of the common farmer lack the intelligence of the same class in Britain. The French farmer performs most of this labours without the employment of extra hands, his wife and daughters—if he has them—reaping, threshing, and doing almost every part of the farm and garden work indifferently. Such farmers, according to Neill, prefer living in villages; society and the evening dance being nearly as indispen-

sable to them as their daily food. If the farm be distant, the farmer and his servants of all descriptions set off early in the morning in a light waggon, carrying set on early in the morming in a light waggin, carrying with them that provisions for the day. Large farms are rare in France; but where they do exist, they have generally farmeries upon the lands, where the work is mostly done by labourers, who, with the herdsmen employed, are frequently paid in kind. All the plants cultivated by the British farmer are also cultivated by the French, with the exception of the turnip, which is not generally grown, especially in the warm districts, where it does not bulb. Perhaps one of the most remarkable features in French agriculture, and of most warm countries, is the use of the leaves of trees as food for cattle. These are supplied in autumn by the mulberry, the olive, the poplar, the vine, find other deciduous plants, when their colour begins to change. During the winter they are given to the cattle and sheep like hay, and are, sometimes, boiled with grain or bean for cows.

Such is a sketch of the progress and state of agricul-ture in those countries which approach nearest to our own in the practice of that science. Every nation, however, being generally less advanced than ourselves, no instruction can be furnished by giving an account in

no instruction can be furnished by giving an account in detail of their defective systems. For a consideration of the practical part of agriculture as pursued in England, see Soil, Manuer, Drainage, Crofs, Farmanials, Ploughing, &c.
Arbenonia, ig,-i-mo'-ni-\(\tilde{a}\) (Lat.), the Agrimony, a genus of dicotyledonous plants, belonging to the Rose order, or Rosacea. The species A. Espatoriu is one of our common roadside plants, and is found in flower about June. The leaves are very handsone, being large, and doorly git at the adjourned divided graphers. large and deeply cut at the edge, and divided even down to the main stalk; the flowers are yellow, arranged on a long simple spike, with a little leaf at the base of each, and the fruit is beset with bristles. This plant has been used in medicine as a vermifuge and an astringent.

astringent.

AGEIONIA, & f-ri-o'-mi-a (Gr. agrics, rustic, rade), among the ancients, an annual festival in honour of Bacchus, which was usually celebrated during the night. According to Plutarch, it was so named on account of the rudeness and intemperance which generally attended its celebration.

AGEORTEMMA, & f-rox-tom'-ma (Gr. agros, a field, stemma, a crown), in Bot., a genus of dicotyledonous plants of the Pink order, or Caryophyllacee. The species A. githago is the common corn-cockle, a well-known ornamental plant in our cornfields.

AGEORTIS, & f-rox-tis, in Bot., a genus of Grasses, including nume? Your species, all furnishing excellent forage.

forage.

Agnown, a-ground (Ang.-Sax.), in Mar., a term signifying the situation of a ship, whose bottom, or any part of it, hangs or rests upon the ground, so as to render her immovable till a greater quantity of water shall float her off, or till she shall be drawn out into the stream by the application of mechanical powers.

AGUE, or INTERMITTENT FEVER, ai gu (Fr. aigue, sharp), in Med., a disease generally occasioned by exhalations arising from marshy grounds, stagment water, or decaying vegetable substance. It is charac-terized by a series of separate attacks, occurring at regular intervals of one or more days, according to regular incervals of one or more days, according to which it is termed quotidium, tertian, or quartan. Each attack is divided into three stages, which follow each other in regular succession. The first, or cold each other in regular succession. The first, or cold stage, is characterized by a feeling of extreme cold and languor, and an uncontrollable tremor over the whole body. This is followed by the hot stage, when the skin becomes hot and dry, the pulse quick and full, and the features flushed. In the sweating stage, a profusion of sweat breaks out over the whole body, which continues for some time, and then the attack the stage of the terminates. During the cold stage, warm baths, diaphoretic drinks, and such-like means, are to be adopted; in the hot stage, saline draughts and diaphoretics should be administered; and in the last stage, the patient is to be kept cool, and, if very weak, may receive a little wine or brandy-and-water. The general treatment in ague is to strengthen the system by means of tonics, such as quinine or Peruvian bark.

AHBAD, a-hed (Ang.-Sax.), in Mar., a term signi-

Air-Gun

fying further caward than the ship, or at any distance before her, lying immediately on that point of the compass to which her stem is directed. It is used in

compass to when mor stem is directed. It is used in opposition to astern, which expresses the situation of an object behind the ship.

ARBIAN, air-t-an, in Geol., a term applied to the middle group of the series of Devonian rocks belonging to Belgium and the Rhine. This group includes bluish

grey grits, sandstones, and shales.

Anut., i-hul' (Ang.-Sax.), in Mar., a term signifying the situation of a ship when all her sails are furled, and her helm lashed on the lee-side: she then lies nearly with her side to the wind and sea, her head being somewhat turned to the direction of the wind.

somewhat turned to the direction of the wind.

A1. (See Bradyrus.)

ARIMAG LOTABUR, aik-ma-lo-tark (Gr. aichmalotar-ches, chief of the captives), in Ecc. List., a title given by the Jews to the prince by whom they were governed whilst in captivity at Babylon. According to the Hebrew writers, he was always of the tribe of Judah. It has, however, been doubted whether such a dignitary held office previous to the 2nd century when Huna held office previous to the 2nd century, when Huna was appointed sichmalotarch.

A1D, aid (Fr. aide), in Law.—Aids were originally more benevolences granted by the tenant to his lord, in times of difficulty and distress; but, in process of time, they grew to be considered as a matter of right, and not of discretion. These aids were principally three:—1. To ranson the lord's person, if taken prisoner. 2. To make the lord's eldest son and heir-apparent a knight. 3. To marry the lerd's eldest daughter, by giving her suitable portion.—Ref. Bracton; 2 Bl. Com. 63.
AIDR-DE-CAMP, aid'de-kan, a Mil. term, taken from the French, and denoting an officer employed to re-

ceive and convey the orders of a general:
Alguer, ai'-glet, in Zool., a young eagle.

EAGLE.)

AIGRET, or EGRET, as -gret, in Bot., a term formerly applied to a little feathery crown or tuft attached to the seed-case or fruit of the dandelion, the scabious, and many other plants, and by means of which the seed is transported through the air to a distance. This peculiar appendage is now called a pappus. (See Paprus.)

AIGUILLETTES, or AIGLETS, ai'-glets (Fr.), the metal sheathings or tags at the end of the ribbons used to tie different pertions of the costume worn in the 16th and 17th centuries. The significations were sometimes gold and silver, and elaborately chased. The pictures of Holbein, and the portraits of his time, give many examples of their form, and Shakspere and many of the clder dramatists allude to them.

Arousce, ai-giseau (Fr.), in Hera a term employed to denote a cross which has the two angles at the ends cut off, so as to terminate in two points, in opposition to the cross fitche, which tapers to a

point.

AILERTIES, or AILERONES, ai'-lets (Fr., little wings), the original design from which the modern epaulette was taken. Their object was to furnish a proservice, they were made of leather, and ornamented with a personal findge or device, or the heraldic bearings of the wearers. They came into fashion in the earlier portion of the reign of Edward II., and ceased to be wore during the reign of Edward III. Dress allettes were made of leather covered with silk or cloth, with fringes, and were laced to the shoulders of the hauberk with cords of silk.

AIM FRONTLET, aim frunt'-let, in Mil., an instrument formerly used by gunners to level and direct their

Are, air (Gr. aer, air).—This term is generally taken to mean the atmosphere with which our globe is sur-rounded; but in the chemical works of the last century it is often applied to bodies known at the present day as gases. Air is a mechanical mixture of two gases, oxygen and nitrogen; in the proportion, by measure, of 20 ell oxygen to 70 l9 nitrogen; or by weight, 23 el oxygen to 76 el nitrogen. Besides nitrogen and oxygen, it contains small quantities of carbonic acid and aqueous vapour, differing according to the locality and weather. Air, in common with all other bodies, has a perceptible weight. This is proved by weighing a flask before and after it has been exhausted of its air.

According to Biot, 100 cubic inches weigh 31 Heat causes air to expand, cold to contract. To cupping glass is a familiar instance of the former is 1f a bladder is half-filled with air, and held near a it it will expand until the bladder is quise full; on ber it will expand until the bladder is quite full; on being taken away, it contracts gradually to its former bulk. Air being clastic and compressible, it follows, that the higher we go, the lighter the air becomes. (For dissolves a definite amount of aqueous vapour at different temperatures; hence the sudden formation and disappearance of clouds. In large masses sir has a blue tinge. The distant hills appear of this colour, from being seen through several miles, of has a blue tinge. The distant hills appear of this colour, from being seen through several miles of air, and the sky appears blue from the same cause. As stated above, air consists of oxygen and nitrogen. Were it composed of oxygen only, we should breaths away our bodies too fast, while nitrogen alone would kill us. By the mixture, a proper strength of air necessary to life is kept up. The perfect mechanical mixture of the two gases which form air is an excellent example of the diffusion of gases. When two gases are united, they gradually mix with each other nutil perfect diffusion takes place. The air, therefore, that is analyzed at the foot of Chimborazo has the same composition as that analyzed at the has the same composition as that analyzed at its summit, though it differ materially in density. Dr. Frankland has lately discovered that combustion takes place in proportion to the density of the air. A candle, weighing an ounce, took a longer time to burn at the top of Mont Blanc than one of the same size and weight which was burnt in the valley of Chamounix. weight which was burnt in the valley of Chamoning. From this it follows, that human beings must breathe slower in valleys and quicker at greater attitudes. The air is continually being rendered impure by the breathing of animals, the oxygen it contains being transformed into carbonic acid. This, however, lasts but a short time, being quickly separated into carbon and oxygen by plants, which retain the former body for their own nourishment, releasing the latter to serve again as support for animal 140.

AIR, in Music, a term which, when applied to vecal music, signifies a composition for a single voice. It is synonymous with "melody."

Ath-Balloon. (See Balloon.)
Arb-Beds.—An air-beds consists of a sack, in the shape of a mattress, divided into a number of air-tight compariments, a projection at one end forming the holster. Each compartment is provided with a valve, and can be inflated with air by means of a believe. Air-beds were known at the commencement of the 18th century; but, being manufactured of leather, were of considerable cost. They are now made of mackintosh cloth and vulcanized india-rubber. Their advantages are coolness, elasticity, and portability; and they are especially valuable to invalids.

AIR-BLADDER, an organ which, in fishes, generally adapts the specific gravity of their bodies to the weight of the water in which they are at different depths.

AIR-CUSHIONS are conveniences of similar construction to air beds, but less complicated, and chesper.

AIR-ENGINE.—A machine analogous to the steam-engine, in which rarefled or condensed air takes the place of steam. Many engines of this kind have been patented and used experimentally. There are many difficulties in connection with the employment of air in lieu of steam, which prevent them from coming into general use.—Under CALORIC ENGINE will be found accounts of several, which have been successfully worked by means of hot air.

AIR-GUN .- An instrument through which bullets are propelled by means of the sudden escape of comare propelled by means of the studies escape of com-pressed air. In appearance they are similar to ordi-nary arms, the stock of the gun being the reservoir into which the air is forced by a condensing syringe. There is a valve immediately behind the bullet, through which a small quantity of compressed air rushes as soon as it is opened, by pressing the trigger with the finger. As soon as the trigger is released, the valve closes again. There are too many objections to their onger. As soon as the trigger is released, the tarve closes again. There are too many objections to their use, for air-guns over to gain a higher position than that of destructive philosophical toys. The amount of force required to be expended in condensing the air, the gradual diminution of power after each shot is fired, and their liability to get out of order, effectually

#### Air-Jacket

preclude their general use. It is said that they were invented by Marin, a native of Lisieux, in France, who presented one to Henry IV.

ALE-JACKET, a garment, formerly made of leather, and now of other materials, having several bags communicating with each other, which were filled with air by a leather tube, furnished with a brass stop-cock, by which means a person may float without learning to

ARE-PASSAGES AND AIR-CELLS, in Bot., are large intercellular passages and spaces occurring in the stems and leaves of some monocotyledonous plants, espe-cially those which are aquetic.

Ale-Pires, commonly called Sutton's air-pipes, from the name of the inventor. They are formed on the principle, that air is necessary for the support of fire, and were contrived to cleanse the holds of ships of foul sir. This was done by closing the two holes under the copper or boiler, and in their room laying a copper or leaden pipe from the hold into the ash-place, by which means the foul air was discharged from the hold, and a supply of fresh air from the hatches allowed to

AIR-PLANTS, in Bot., are those members of the vegetable kingdom which derive nourishment entirely from the air by means of slender agrial roots. Most of the Oscilida - 1 of the Orchids and Tillandsias, which grow on the trunks and branches of trees in warm climates, are true The term epiphytes is sometimes applied to

such plants. -As its name indicates, an air-pump is a AIR-PUMP. machine for extracting the air from a closed vessel, so as to form as near an approach to a vacuum as possible. It is composed of a cylinder, in which works a piston, furnished with a valve opening upwards. At the bottom of the cylinder is another valve, also open. ing upwards, and closing or opening a tube connected with the plate upon which is placed the vessel to be exhausted. If the piston is raised when it is at the bottom of the cylinder, the air pressing on the valve belonging to it keeps it closed, and a partial rarefaction of the air takes place. On lowering it, the air presses on the valve at the bottom of the cylinder, cutting off the communication between it and the receiver, and opening the valve in the piston. The piston, on being raised once more, again rarelles the air in the receiver. and continues to do so at each successive stroke of the and continues to do so at each successive stroke of the pump. An absolutely perfect vacuum can never be made in this way, as, at a certain point, the rarefled air becomes too attenuated to lift the piston-valve. In most air-pumps two cylinders are used, to save time; the piston of one descending while that of the other is ascending. Combected with the tube leading to the receiver is a shortened barometer, the height of the mercury in which shows the exact degree of rarefaction. The air-pump was invented by Otto Guericke, in 1690. (See KENNEDY'S AIR-PUMP.)

AIR-SACS. in Bot., small membranous pouches filled

AIS-SACS, in Bot., small membranous pouches filled with air, which form the floating apparatus of the

Bladder-wort (see this word).

Arm-SHAFTS, in Mining, holes made from the surface to the adits, to furnish fresh air to the miners. ARTHERMOMETER.—This instrument, which is seldom used, consists of a capillary tube, open at one end, and terminating at the other with a large bulb, full of sir, which is separated from the external atmosphere by a liquid index of coloured sulphuric acid, which rises and falls as the air in the bulb contracts or expends.

AIR WEELDS, a term in Nat. Hist., applied to those filaments which float in the air in autumn. They are made by the long-legged field spiders.

AIRLE, ile (Fr. ails, wing), in Arch., denotes that lateral division of a church which forms the side of the edifice. Thus, when a church is divided into three compartments, the middle or principal compartment is called the nave, and the two outlying compartments form the aisles. English churches have seldom more than two aisles; but in foreign ecclesiastical edifices there are often as many as four aisles, two on each side of the nave. Sometimes the term sisle is given to all the compartments of a church, which is then spoken of as "three-sisled," the nave or body of the building forming the middle aisle, and the side compartments the side-sisles. (See Church, Transfer, Navr.)

#### Alauda

AJUGA, a-joo'-ga, in Bot., the Bugle, a genus of plants belonging to the Labiste order. A. reptans is a common plant in moist pastures. The stem is creeping, but the belonging to the Labinate truer. It is to me is oreeping, but the flowering part erect. This part has many leaves or bracts of a purplish hue, proceeding from each whorl of labiate flowers: the latter are generally blue, sometimes white or flesh-coloured. The plant was formerly

thought good for wounds.

AKER FRUIT, a-ke', in Bot., the produce of a species of seapwort growing in the West Indies. (See

CUPANIA.)

AKI, ai'-ki, in Bot., the native appellation for the Lignum vite of New Zealand. This and other species of the genus Metrosideros afford valuable timber, used by civilized races in many of the peaceful arts, and by the South-Sea Islanders to form their terrible clobs. The

genus belongs to the Myrtle order, or Myrtaceæ.

ALBEMM BEDS, bl-a-bal-ma, in Geol, a group of rocks in North America, placed by Sir Charles Lyell among the productions of the middle Eocene period.

ALBESTER, bl-a-bas-ter, in Min., a white substance mad for organization through the productions of the middle Eocene period.

ALBASTER, a.-d-06x-ter, in Min., a wave substance used for ornamental purposes. Its name is derived from Alabastron, in Egypt, whence the ancients obtained a supply of the stone, and where it was manufactured into vases and other small vessels. The ancients made use of these vessels to hold a certain kind of perfune, with which vessels to the certain kind of perfune, with which, according to Horace, it was the custom to anoint the heads of the guests at a feast. Mary, the sister of Lazarus, poured a "very precious ointment" from an alabaster box upon the head of our Saviour whilst seated at supper. In the British Museum there are several of these ancient alabaster vessels. There are two varieties of alabaster; one a carbonate of lime, and the other gypsum, or sulphate of lime, the latter being that which is generally known as alabaster. It is a soft stone, may be scratched with the nail, and is beautifully white and semi-transparent. Being easy to work, large quantities of vases, lamps, and toys, are made from it. The finest sort of alabaster is obtained from Valterra, in Tuscany, and it is also found in Derbyshire and Staffordshire.

ALABASTRUS, di-les-trus, in Bot., a name some-times given to the flower-bud. Al.E., ai'-lee (Lat., wings), in Bot., the two lateral petals of a papilionnecous or butterfly-shaped corolls. ALANGIACE E. all an ge-ai's se-e, in Not, the Alangium order of monocotyledonous plants, including four genera and eight species, which are trees or shrubs, natives of various parts of the East Indies, and North America. The fruits of most of these plants are edible; that of the Nyssa apilata is used as a subtitute for lime-fruit, and is sometimes called the Ogechee lime.

nme-rrut, and is sometimes called the Ogechee lime.

Alara, a. &-r-ac, is the name given by Mahometans
to the wall which they say divides heaven and hell.

Alara, a-lair'-ees, in Rom. Mil. Antiq., a kind of
militia; but, according to some, they were the cavalry,
stationed as the two wings or alw of the army.

Alaria, a-lair'-i-a, in Bot., a genus of fuccideous
sea-weeds. One British species is known, A. esculenta,
a common sea-weed, having a large flat and narrow
leaf-like frond, with a thick midtib. or prolemention of leaf-like frond, with a thick midrib, or prolongation of the stalk by which it is attached to the rocks. It grows from four to twelve feet long, and is sometimes employed for food. Its common names are Bladderlocks. Hen-ware, and Honey-ware.

ALAMA, a-larm', a sudden surprise occasioning fear or terror; an outery intimating the approach of dan-ger. In Mil., it denotes either the apprehension of being attacked, or the notice given of a sudden attack,

as by firing a rifle, &c.

as by firing a rille, &c.

ALAEMISTS, a-larm'-ists, in Pol., a term applied generally to those persons who are easily alarmed at the first whisper of bad news, who industriously circulate it, and exaggerate its probable consequences. In Politics, it particularly designates those individuals who fear any change of policy, or alteration of recoined towns. ceived forms.

ALAUDA, a-law'-da (Lat. alauda, a lark), in Orn., the lark, a genus of birds, belonging to the conirostral tribe of the order Pauseres, and fam. Fringilidae. Charac. Beak cylindrical; nostrils concealed; head orested; tail forked wings long; no spurious quill; the first, second, and third quills longest, and nearly equal; the rest considerably graduated. Various species of larks are found in all quarters of the globe. The skylark, or laverock (Alauda arvensis), is the best known in this country. He is unrivalled as a songster, and has been a theme for poets from the earliest ages. and has been a theme for poets from the earliest ages. The male alone is gifted with melody; the female makes her nest among the herbage or opra, and devotes herself almost constantly to the process of incubation. They are granivorous birds, of migratory habits, and, instead of washing, shake dust among their feathers. They are considered a great delicacy for the table. The season for eaching larks commences, in this country, in the middle of September, and terminates at the end of February. More than 4,000 dozen are annually supplied to the London markets alone. The Alauda arrensis, or skylark, and the Alauda arborea, or woodlark, are the only ones that sing when flying. or woodnark, are the only ones that sing when hying. The skylark rises perpendicularly, the woodlark in wildlysextended circles; and they sometimes soar to an enormous height, and sing for an hour together. The shorelark (Alauda alpestris) is frequently found in North America, and generally breeds near the seashore. The calaudra lark (Melancorypha calaudra) is a larger bird than the skylark, and possesses a more sonorous voice. In Italy, a good singer is compared to a calandra. Among other species, there are the pratensis, or titlark, which frequents meadows;—the arborea, or woodlark, distinguished by a white fillet about the head. It is less than the skylark; the colours are paler, and the voice less varied, but sweet. The campestris has half of the chief feathers of the The competers has half of the chief feathers of the wings brown, except two, which are white, and the throat and breast yellowish. The trivialis, whose tail is partly brown and partly white, is a native of Sweden. The cristate, a native of Europe, and sings like the skylark. The spinoletta, a native of Italy. The magna, common in Africa and America. The New Zealand lark, which inhabits Charlotte Sound, where it is named known course.

it is named kagoo arours.

Alb, ilb (Lat. albus, white), an ecclesiastical vestment of great antiquity, made of white linen, of sufficient length to hang down to the heels, open in front like a surplice, tight in the sleeves, and girded at the loins. In the ancient church, the newly-baptized persons were a white vestment or all; whence the Sunday after Easter, the day upon which the cate-chumens received haptism, came to be called Dominica in albis—whence Whit-Sunday.

ALBATA. (See NICKEL.)

ALBATA. (See NICERA.)

ALBATROSS, 8th-ba-tross (Diomedia), a gen. of webfooted birds, of which there are three species,—the common albatross, D. exulans; the sibatross of China, D. fuliginosa; and the yellow-and-black-beaked albatross, D. chlororynchos. Charac. A long, hard beak, curved at the extremity, the upper man-Charac. A long,

ALBATROSS

dible composed of several articulated pieces, the! lower mandible smooth and short; the nostrile lateral, and placed like small rolls in the furrow of the mandible; feet short, with the three toes long and completely webbed; wings long and narrow. The common albatross, which is often met with in the seas of

Southern Africa, is the largest sea-bird known; its weight varying from 12 to 28 bs. A specimen in the Leverian Museum measured 13 feet between the exbird, shot off the extended wings. One remarkably large bird, shot off the Cape of Good Hope, measured from wing to wing 17½ feet. The top of the head is a raddy wing to wing 173 feet. The top of the head is a rad grey, the rest of the plumage, with the exception several transverse black bands on the back, and a fe of the wing-feathers, is white; the bill is of a pale yellow, and the feet and membrane of a deep flesh colour. Towards the end of June these birds however conour. It owns the end of some cases thrus mover in immense flocks about Behring's Straits and Kambeschatka, attracted thither by the shoals of fish, whose migrations the albatross persoveringly follows. So great is their voracity, that they will awallow a salmon

of 5 bs. weight; they do not, however, limit their diet to fish, but will prey on any sea animal.

ALBIGUNES, dib-bi-per-sees, was a common name given to the different sects that existed in the south of France in the latter half of the twelfth and beginof France in the latter half of the twelfth and beginning of the thirteenth ceutury. They differed among each other in their particular tenets, but agreed in denying the authority of the pope in spiritual matters, and in opposing the discipline and ceremonies of the Church of Rome. They were so called from the town of Albs, or Alby, in and around which they were most numerous. In 1183, Alexander III. published a decree against these sects in a council at Tours, and another in 1179. On the accession of Innocent III, to the paoff chair, in 1198, he sent two Innocent III. to the papel chair, in 1198, he sent two Cistercians, Rainer and Guido, to proceed against the heretics. They were to endeavour to convince them by arguments, and, if these failed, to pronounce the ban upon them. Their goods and property were to be by arguments, and, if these failed, to pronounce the ban upon them. Their goods and property were to be confiscated, and themselves banished from the country. These proceedings, however, were followed by little success; and the assassination, in 1208, of one of the pope's delegates, Peter of Castalnau, who had rendered himself odious by his cruelties, gave rise to many years of a most bloody war, in which the worst outrages of fanaticism and cupidity were practised against the inhabitants of these districts. Raymond VI., count of Toulouse, was leader of the Albigenes, and Simon, count of Montfort, commanded the expedition against them. At the taking of Beziers, it is said that 60,000 them. At the taking of Beziers, it is said that 60,000 of the inhabitants were put to the sword; and it is said that one of the pope's legates, when asked how they were to distinguish the heretics from true Catholies, replied, "Kill all, and God will find out his own."
Montfort lost his life at the siege of Toulouse, in 1218,

Montfort lost his life at the siege of Toulouse, in 1218, and Raymond, his adversary, died in 1222. The war was prosecuted by their successors, until RaymondVII., pressed on all sides, was obliged to make peace in 1229, giving up two-thirds of his estates to the king, promising submission to the pope, and paying a large sum to the Church. He died soon after and in him the house of the counts of Toulouse became extinct, and its territories reverted to the French crown. When peace was obtained, the Inquisition was established at Toulouse, and those who escaped from the aword died by the those who escaped from the sword died by the

hands of the Inquisition.

ALBINO, al-bee'-no (from Lat. albus, white), person of a preternatural whiteness of the skin and hair, and peculiar redness of the pupil of the eye, which, in some cases, is so weak as not to be able to bear the light of day. The not to be able to bear the light of day. The Portuguese first applied the term to the white negroes whom they found on the coast of Africa, but it is now used to designate persons who exhibit similar characteristics, of whatever race.

AL-BORAK, al bo-rak' (Arab., shining whiteness), the name given, in Mahometan tradition, to an imaginary animal, which was said to have carried Mahomet upon his journey from Jerussalem to the heaves.

salem to the heavens. ALBUM, all-bum (Lat. albus, white), among the

Romans, was a white board or register, on which the names of persons or public transactions were in-scribed. The term is now usually applied to a book for receiving autographs or other manuscript contri-

butions of friends or celebrated individuals.

ALBUNEN, äl-bu'-men (Lat. albus, white), in Chem., a whitish viscous matter slightly salt to the taste, and

### Albuman

an important element in vegetable and animal organic substances. It is distinguished by its peculiar property of becoming coagulated or insoluble at a high temperature. White of egg as entirely of albumen. White of egg and serum of blood consist almost The hair and nails contain large quantities of it in its cosmilated state. Pure albumen is insoluble in water. White of egg and serum contain a certain amount of free alkali, in which it is distain a certain amount of free alkall, in which it is dis-solved; hence its precipitation when acids are added. It is also precipitated when salts of mercury, copper, silver, lead, &c., are added to its solution, forming with them definite insoluble compounds. This property renders, it valuable as an antidote to metallic poisons. Tannin, gallic acid, and extractive matter behave with it in a similar manner; for which reason it is used much in the arts as a clarifying agent. It is greatly used in photography, for giving depth and intensity to photo-graphic prints. Its chemistry is very complex, and requires investigation. Its composition is given below, the presence of sulphur being rendered familiar to all by the effects of cooked eggs upon silver spoons. by the effects of cooked eggs upon silver spoons.

Carbon .			•	٠.	53.5
Hydrogen				.,	7.0

Sulphur .	-				1.6

A seed entirely devoid of this structure is said to be exalbuminous, and one which includes it, albuminous. The cells of the albumen contain nutriment for the germinating embryo in the form of starch, of oil, or of cellulose. Sometimes the cells are thickened by secondary deposits, and the whole structure becomes horny; thus, vegetable ivory is nothing more than the albumen of the seed of a species of palm. The stone of the date, and the nut of the areca paim, are further examples of hardened albumen. In the seed of the coffee-plant, the albumen is the horny portion which is so familiar to us as the "coffee-berry." When a seed contains no albumen, the cotyledons sup-When a seed contains no ablumen, the cotylectons supply the nutriment required by the growing portions of the embryo. Some botanists use the term perisperm for this structure, as the word albumen has a totally different signification in chemistry.

ALBUMENIZED PAPER. (See PHOTOGRAPHY.)

ALBUM GLECUM. (See TANNING.)

ALBURTUM, il-bur-num (Lat.), in Bot., the sap-wood, the white and comparatively soft part of an exogenous stem, hetween the inner bark and the decrement.

stem, between the inner bark and the duramen, or heart-wood. The difference between these two kinds heart-wood. The difference between these two kinds of wood is often very striking. Thus, in the ebony-tree the duramen is black and the alburnum pale. All the vital functions are performed by the sap-wood, as is proved by the vigorous growth of many a hollow tree. ALCA, or AUE. (See AUE.)
ALCATO, J.L.WI-L., a name given to a kind of verse said to have been invented by the Greek poet Alcaus.

It is formed of four feet, with a cæsura in the middle. The first foot is a spondee, rarely an iambus; the second an iambus; then the cæsura, followed by two

datyls; as—

It is sweet and glorious to die for one's country.

Alcarder, or Accarder, al-kaid', a Spanish word,
dorired from the Arabic kada, to heed or govern, and used by the Moors, Spaniards, and Portuguese for a governor, usually of a fortress or castle.

Alcalde, al-kal'-dai, is, in Spain, the title of a judge sprointed by the government, or elected by the towns, to administer justice within a certain district.

Anomaran, Krights of al-kan-ta'-ra, an order of Spain, uniting in themselves both religious and military duties. They took their denomination from the town of the same name, on the Tagus, and had their rise about the beginning of the 13th century.

ALGARRAZAS, al-kar-ra'-zas, a name given to aspecies of course pottery, manufactured in Spain, and used for

### Alchemy

cooling wines. This is effected by means of its extreme porosity, the wine passing through the pores, when a copious evaporation takes place from the small pora copious evaporation takes place from the small por-tion of water which penetrates to the outside. It is made of clay, consisting of sixty parts of calcareous earth, mixed with alumins, and a little peroxide of iron, and thirty-six of silicious earth, mixed with a little alumins; to which a quantity of salt is added in the mixing. The vessels are only half, or at least not the mixing. ! wholly baked.

wholly baked. al-ka-va'-la, in Com., a custom-house duty paid in Spain, on imported goods, at the rate of 5 per cent. upon the value of the commodity.

ALCEDO, or KINGTISHER, ül-se'-do, a family of birds belonging to the fissirostral tribe of the ord. Passeres. Charac. Bill long, thick, pointed, and quadrangular; tongue short, and slightly arrow-chapted at the point; nostrils at the side of the base of the bill; legs short; three tocs, the outer joined to the middle one as far as the second joint; wings with the first and second quills nearly equal. Only one species of kingfisher is indigenous to Britain, though there are sixty other species described by naturalists. This bird was known to the ancients by the name of Halcyon. They supposed that its nest was built upon the surface of the sea, and that during incubation it Oxygen

ALESURAR, in Bot., a term used to denote the cellular structure which surrounds the embryo of a were called Haleyon days. The Ostiacs and present in every case; for sometimes the ambryo alone forms the nucleus of the seed, as in the pea, the bean, and the wallflower. When it is the pea, the bean, and the wallflower. When it is woman touched by a feather which has foated on the amount of space it occupies is in inverse woman touched by a feather which has foated on the water, will full in love with the man who uses it.

The most remarkable among the species are:—1.

The most remarkable among the species are:—1. plumage a bright green, glossed with copper and gold. This species is found in Guiana and Brazil, and feeds on insects.—2. Alcedo ipsida, or common king-flisher, about the size of a swallow; bill long, and the shape inelegant; top of the head and the coverts of the wings of a dark green, spotted with light blue; back and tail of a bright azure; the under side of the back and tail of a origin azure; one unure since or such body orange. It feeds on fish.—8. Alecdo paradisa, or paradise jacamar, of the same size as the preceding; throat, front of the neck, and under wing-coverts, white, the rest of the body a dull green, slightly shaded with black, violet, and copper. It is a native of the body as dull green, slightly shaded with black, violet, and copper. shaded with black, violet, and copper. It is a native of Surinam.—1. Alcedo ridis, or Egyptian kingfisher, about the size of the Royston crow; bill black; head, shoulders, and back, brown; throat and belly dusky white; tail ash-coloured; the legs of a pale green, and the claws back. It is a native of Egypt, and feeds and the claws have. It is a native of E5 ps, and rects on frogs, insects, and small fish.—5. Alcedo cayenesis; about the size of a starling; back of a blue colour, the under parts white, and the legs red. It is a native of Cayenne and Guiana.—6. Alcedo torquata, or cinereous kingfisher, about the size of a magpie; colours, a bluish ash, chestnut, white, black, and yellow. It is a native of the West Indies.

ALCES, dl-sees, the Elk. (See Dren.)
ALCHEMILLA, dl-ke-mil'-la, in Bot., the Lady's-mantle, a gen. of plants in the nat. ord. Rosacea, subord, Sanguisorbea. Three British species are known.

ord. Sanguisorbea. Three British species are known,—
A. alpina, A. valgaris, and A. arcensis.—the mountain,
common, and field lady's-mantles. They have small
green flowers arranged in bunches. The latter species
is thought to be diuretic.
Alchemy, ill-kim-e (Arab. al, the, Gr. chemia,
chemistry).—The term alchemist is generally applied,
in an opprobrious sense, to the ancient chemists,
who are vulgarly supposed to have been mere
visionaries, searching only after chimeras Although
many of the alchemists were invostors, working upon many of the alchemists were impostors, working upon the minds of the unenlightened for their own ends, still there were many more really great men amongst them, who, by their genius and labours, have laid the foundations of modern chemistry; men who made discoveries amidst inconceivable difficulties, that we nowmays have no notion of. Such men as Paracelsus, Raymond Lully, Glauber, Friar Bacon, Van Helmont, Albertus Magnus, Basil Valentine, and a boot o. others, have left behind them enduring monuments of their greatness, in the form of medicines and preparations,

### Alcohol

indispensable to the chemist and pharmacist, even in these enlightened days. The great end of all their researches was the discovery of the philosopher's stone, which was to have the power of transmuting all metals into gold. Their ideas in this matter were perfectly reasonable and logical. They found, that by burning and melting, ut a great heat, a gull, heavy, earthy body, they obtained a brilliant metal; and further, that by treating in the same way lead ore, a semi-metal, they

ALCHEMIST, AT WORK.

produced a perfectly metallic substance. From these facts, they reasoned that gold and silver were pure forms of baser metals, and their experiments tended forms of baser metals, and their experiments tended to the discovery of the agent which was to work this change. In the same way, following out this train of reasoning, they imagined that this great purifier of metals would play the same part with the human subject, and purify it so effectually as to prolong life indefinitely; hence the search after the clixir of life. The idea of the universal solvent is not so absurd as it is made to appear. Their notion in this was to obtain a solvent for all metals, and not for all substances will represent supposed.

stances, as is generally supposed.

stances, as is generally supposed.

ALCONOT, dit-kg-hol (Arab. al, the, kooll, any volatile substance).— If a solution of sugar he exposed to the air for any length of time, no change will take place; but if vegetable or animal organic matter he present, fermentation commences, and a fresh principle is formed, which may be separated by distillation. The first distillate is comparatively weak; but by the use of caustic potash, which has a powerful afflinity for water, absolute alcohol is obtained. Pure alcohol is colourless and limpid, pungent to the taste and smell. Its specific gravity at 60° is '7938. It boils at 173°, and has been rendered gelatinous by cold, but has never been frozen. It is very inflammable, and has never been frozen. It is very inflammable, and burns without smoke. It mixes with water in all proportions, and has a great attraction for it. Its solvent powers are great, especially with respect to resine and resinous gums. The strength of alcohol is in exact powers are great, especially with respect to resists and resistous guins. The strength of alcohol is in exact proportion to its density, which is estimated by means of an hydrometer. Excise proce spirit has a specific gravity of '918, and contains 49½ per cent. of absolute alcohol. Wine, beer, and spirits owe their intoxicating properties to alcohol. The chemical composition of alcohol is C.H.O., and it is regarded by chemists as a hydrated oxide of the organic base ethyl; i.e., C.4H.6O+HO. In like manner, methylic alcohol is hydrated oxide of methyl, C.H.O.+HO, amylic alcohol; the simple oxides being citylic, methylic, amylic, and capric ethers. (See ETHER.) The alcohols are very numerous, their number being increased daily. Alcohol of different strengths is much used in the arts, as a solvent for varnishes, resins, and essential oils; as a fuel in spirit-lamps, as an antiseptic, and as a stimulant in medicine.

# Aldehyde

wine and spirits depends mainly on the amount of alcohol they contain, it is of the greatest consequence that it should be easily and quickly found. In the case of spirits, which consist mainly of alcohol and water, this is comparatively easy, the specific gravity being in direct proportion to the amount of alcohol in the mixture. A specific-gravity bottle, or a hydro-meter, is used in this instance; but in the case or wine, which contains saccharine and other substances besides which contains saccharine and other substances besides the alcohol, which materially influence its density, recourse is obliged to be had either to distillation or to one of the following methods:—1. By determining the boiling-point of the liquid; 2, the amount of dista-tion it undergoes when its temperature is raised from 2004 a 2004. 60° to 212°; or 3. by evaporating half the liquid in the open air, and restoring it to its original bulk by adding water, the difference of specific gravity, taken become and after the evaporation, will indicate the amount of alcohol. None of these processes are absolutely cor-rect; if, therefore, perfect accuracy is required, regular chemical analyses must be performed. The following tables give the amount of alcohol in various

(See ALNUS.) ALDER.

ALDER. (See ALEVOS.)

ALDERMAN, cavil-der-midn, a term derived from the con\_narative degree of the Ang.-Sax word eald, old, and man. Earls, governors of provinces, and other persons of distinction, were generally termed aldermen by the Anglo-Saxons. The title is now applied to certain magistrates or officers in municipal corporations. By 5 & 6 Will. IV. c. 76, the resident burgesses also corrections when from their new number obscess less corrections. elect councillors, who, from their own number, choose a certain number of aldermen, who hold office for six years, one half going out every three years. One fourth of the municipal council consists of aldermen, and three fourths of councillors. In the corporation of London, which was not affected by the above act, there are twenty-six aldermen, including the lord-mayor, twenty-five of whom are already for the conmayor, twenty-five of whom are elected for life by such freemen as are householders in the twenty-five wards. The twenty-sixth alderman, who belongs to the dependency of Southwark, is appointed by the other aldermen, who generally, when a vacancy occurs, select the senior from among themselves, and a new alderman is elected for the ward for which he sat.

ALTURE EDITIONS, dV-dine, in Bibliography, a term applied to those editions of celebrated authors which came from the press of the family of Aldus Manutius. In 1490, the first of that name established his printing-press at Venice, and posterity is indebted to him for many of the first editions of Greek authors, and other valuable works. In his edition of Virgil, of 1501, the italic characters used in Roman printing first appear; and from that date, a number of classical works, in both the Greek and Latin tongues, were produced from his press in a duodecimo form. These produced from his press in a duodecimo form. These are what is generally understood as the Aldine Editions. are what is generally understood as the Aldine Editions. In 1597, after producing 908 editions, the family press was said to have been broken up; but several Venetian publications, bearing the imprint of the Aldine family. an anchor and a dolphin engraved on the last page, and which appeared early in the 17th century, would seem to contradict the report. For a short time a branch of the Aldine Press was established in Rome. The term has been applied to well-printed books.

All, 41 (Sax. eds., cale, or aloth), the name for-

term has been applied to well-printed books.

ALB, oil (Bax. eala, eale, or aloth), the name formerly given to unhopped matt-liquor, but now applied
to every strong and comparatively light-coloured beer.
The hop was brought into this country from the Netherlands, in the reign of Henry VIII., and the word
beer, from the German bier, was then employed to
distinguish the hopped liquor from the more ancient
haverage. The conversion between hops and the word beverage. The connection between hops and the word beer is indicated by the old couplet:—

"Hops, reformation, bays, and beer,
Came into England all in one year."
Again, Parkinson, in 1640, writes:—"The ale which
our forefathers were accustomed only to drink, being a kind of thicker drink than beer, is now almost quite left off to be made, the use of hops to be nut therein altering the quality thereof, to be much more healthful altering the quality thereof, to be much more neathful or rather physical, to preserve the body from the repletion of gross humours which the ale engendereth." Ale made from mat alone was a favourite beverage of the ancient Germans even in the time of Tacitus. It was, moreover, highly esteemed by the Danes and Anglo-Saxons, being even thought worthy of slaking the thirst of the mighty heroes in the Hall of Odin. It is expressly named as one of the liquors provided for a banquet given by Edward the Confessor. Isidorus and a banquet giver by Edward the Confessor. Isidorus and Orosius state that the ancient Britons and other Celtic nations drank ale, which they made by a process very similar to our modern brewing. They inform us that the grain was firststeeped in water and made to germinate; it was then dried and ground; after which it was infused in a certain quantity of water, and the whole fermented. Ale was formerly regarded in England as an absolute necessary of life, and various ordinances or samises have been passed for regulating its price and an account necessary of life, and various ordinances or sensizes have been passed for regulating its price and quality. Thus, in 1251, during the reign of Henry III., an assize of bread and ale was struck, which settled the price of the latter article as follows:—"A brewer may sell two gallons of ale for a penny in cities, and three or four gallons for the same price in the country."

#### Alehouses

The penny of that time was worth about threepence of of our currency. Some centuries since, ale took the place of our tea or coffee at breakfast. The earl of Northumberkand, in the reign of Henry VIII., lived in the following manner:—"On fiesh-days throughout the year, breakfast for my lord and lady was a loaf of bread, two manchets, & quart of beer, a quart of wine, half a chine of mutton, or a chine of beef, boiled." The same allowance of beer was included in the bill of fare for meagre days, when salt fish and buttered eggs were substituted for beef or mutton. Ale, as now distinguished from porter and small beer, is prepared from pale malt, and, except in the case of bitter ale, a comparatively small proportion of hops. Strong ale is made from the best malt and the fluest kinds of kops, such as the goldings and white-bines of Kent and Surrey, or the mild-flavoured flowers of Worcestershire. The fermentation is allowed to proceed slowly until the yeast is exhausted, and perfectly separated. The Scotch alea are remarkable for the very small quantity of hops which they contain. Burton ale is a very strong and wine-like product, which is highly esteemed. The bitter alee of Bass and Allsopp only differ from this chiefly in having a larger quantity of hops, which imparts a pleasant bitter, and ronders them less prone to turn in hot climates. Strong ales contain from 5½ to 10 per cent., by weight, of alcohol.—Ref. Johnston's Chemistry of Common Life. (See Brewing, Hors, Maler.) The penny of that time was worth about threepence of of our currency. Some centuries since, ale took the place of our tes or coffee at breakfast. The earl of HOPS, MALT.)

ALE-CONNER, kon'-ner, alc-kenner, or one who kens or knows what good ale is. The office is of great antiquity. Ale-conners and ale-tasters were chosen every year in the court-leet of each manor. Similar officers were appointed in towns and boroughs. In the city of Lon-don there are four ale-conners, who are appointed by the liverymen in common-hall on Midsummer-day.

ALECTEYOMANCY, a-lek'-tri-o-man'-se (Gr. alektryon, a cock, manteia, divination), among the ancients, a mode of divination by means of cocks. It was performed by writing the twenty-four letters of the alphabet in the writing the twenty-lour letters of the alphabet in the dust, upon each of which a grain of corn was laid. A cock was then let loose among the letters, and those out of which the bird picked the corn being joined together, were supposed to disclose what was required to be known. In this manner Jamblichus, the master of Proclus, is said to have divined that a person named of Fronts, is sain to have under the person hamed Theodosius, Theodotus, or Theodorus, would succeed the emperor Valens, who, upon hearing of the matter, put to death several persons whose names began with those letters, and obliged Jamblichus to seek a volun-

those letters, and obliged Jamblichus to seek a voluntary death by poison, in order to escape his resentment.

ALEE, a-le', (Ang.-Sax.), in Mar., the term used when the wind, blowing across the line of a ship's course, makes the sails and masts incline to what is then called the lee-side, or to leeward. It also means the situation of the helm when pushed close down to the lee-side of the ship, in order to put the ship about, or to lay her head to windward.

ANYOUNDER (II. NOWLERS (Sax. calls or cale, ale and

ALEMOUSES, ail-houses (Sax. eala or eale, ale, and hus, house), houses in which ale and beer are sold. As early as the year 1496 the inconveniences arising from the assemblage of numbers of riotous persons, and of the excessive drinking in alchouses, became so great as to make them the subject of legis-lation. In the second year of the reign of Henry VII. an act was passed against "vacabounds and beggers," empowering two justices of the peace "to reject and put away comen ale-selling in tounes and places where they shall convenyent (convene), and to take suretie of the keepers of alchouses of their gode behaving by the discretion of the seid justices, and in the same to be avyed and aggreed at the tyme of their sessions." The 5 & 6 of Edw. VI. c. 25, gave to magistrates the power of forbidding the selling of beer and ale at such alchouses, and it was enacted "none should be sufalchouses, and it was enacted "none should be suf-fered to keep slehouses unless publicly allowed at the sessions, or by two justices." This statute, which was the first act of the legislature that placed alchouses under the control of local magistrates, formed the commencement of the system of licenses. An act was passed in 1694, 2 Jac. I. c. b, to restrain the "inordinate haunting and tippling in inns, alchouses, and other victualling-houses." Other statutes were enacted in the reign of James, one of which imposed a penalty on each person convicted of tippling in

### Alembic

an alchouse, of 3s. 4d. for each offence, and, in default of payment, punishment in the stocks for four hours. Other alterations were made in the 7 Jac. I. c. 10, the 21 Jac. I. c. 7, the 1 Csr. I. c. 4, the 3 Csr. I. c. 3, the 21 Jac. 1. c. 7, the 1 Usr. 1. c. 2, the 3 Usr. 1. c. 3, and, in 1654, during the Commonwealth, it was ordered, at the London sessions, that no new licenses should be granted for two years. After the Restoration, in 1682, it was ordered, that no license should in future be granted to alchouse-keepers who frequented conventicles. In Locke's second Letter on Toleration he alludes to their having been driven to take the sacrament for the sake of obtaining licenses to sell ale. In 1729 the sale of spirituous liquors had to me so common that an act was passed, 2 Geo. II. c. 28, enacting that no license should in future be granted but at a general meeting of the magistrates acting in the division as which the applicant dwells. This provision was evaded by men hawking spirits about the streets in wheelbarrows, and exposing them for sale on bulks, sheds, and stalls; and in 1753 a statute was passed, by the provisions of which, with some trifing amendments, the licensing of alchouses continued to be regulated for the remainder of that century. By a statute passed in 1808, 48 Geo. III. c. 143, a difference was introduced 1808, 48 Geo. III. c. 143, a difference was introduced into the mode of licensing, for purposes connected with the collection of the revenue. In 1828 a general act was passed (9 Geo. IV. c. 61), which repealed all former statutes on this subject. Since then various regulations have been made, of which the following are the most recent and important. By the 3 & 4 Vict. c. 61, a license can only be granted to the real occupier of the house in which the beer or cider is to be retailed, and every person amylying for a license must produce cartificate. person applying for a license must produce a certificate from the overseer of his being the real occupier of the from the overseer of his being the real occupier of the house. Licensed victualiers and keepers of beershops who sell ale to be drunk on the premises, are liable to have soldiers billeted upon them. The 11 & 12 Vict. c. 49, and the 18 & 19 Vict. c. 118, regulate the sale of beer and other liquors on Sunday, Christmas-day, and Good Friday.

Good Friday.

ALEMBIO, a-lem'-bik (Arab., al, the, umbeeq, corrupted from the Greek word ambix—a cup or vase), a vessel formerly employed for distilling, that is to say, for separating volatile liquids from substances less volatile. (See DISTILLATION.) The alembic is one of the most ancient instruments of chemical research, and may be regarded as the type of all distillatory apparatus. In its original form, it is seldom used in the ratus. In its original norm, it is seldom used in the modern laboratory; but it must be confessed that it was admirably adapted to the processes in vogue among the alchemiste, by whom it was chiefly used. It consisted of two portions, capable of being separated; the lower—known as the body, cucurbit, bolthead, belly, or chamber,—was a gourd-shaped vessel (whence the name "cucurbit," Lat. cucurbita, gourd), well fitted for being cleansed, or to have materials introduced. The head, or capital, was also singularly perfect in shape for the intended uses; it had a kind of channel all round to convey the liquid condensed in it to the beak, which was connected with the receiver. to the beak, which was connected with the receiver. Several modifications of the alembic are used in the

chemical arts.

chemical arts.

ALEMDROTH, SAL, a-lem'-brawth, a famous preparation of the alchemists, now known to be a double chloride of mercury and ammonium, having the composition expressed by the formula HgCl+NH, Cl+HO.

ALEURITES, àl-u'-ri-tees, in Bot., a genus of dicotyledonous plants, belonging to the order Euphorbiaces, The most interesting species is A. tribaba, the candlenut tree, the seeds of which contain the oil called kukiu, or kekune, which is used in some parts of the world for illuminating purposes, and which has been recommended as a substitute for castor-oil in medicine.

ALEXANDERS, dl-ex-an'-ders, a name given to an escu lent umbelliferous plant, Smyrnium olusatrum, which

lent umbelliferous plant. Smyrnium of usatrum, which was formerly cultivated like oelery.

ALEXATDELAN LIBEARY.—This was, probably, the largest library that had existed before the invention of printing. It was founded at Alexandria, about 284 B.O., by Ptolemy Boter, at the suggestion of Demetrius Phalerius, who had seen the public libraries at Athena. Agents were employed in different parts of Asia and Greece to seek out and purchase the rurest and most valuable works; so that, at length the

# Alexandrine Verse

Alexandrian library is said to have comprised 700,000 volumes. At first, the books were contained in the museum in the Brucheion quarter of the city; but, when they amounted to 400,000 volumes, a new library. was formed, within the Serapeum, or temple of Serapis, where, at length, 300,000 were collected. During the plunder of the city, after its capture by Julius Casar, the old library was accidentally destroyed Julius Cæssar, the old library was accidentally destroyed by fire. That in the Serapeum, however, still remained, and was subsequently largely augmented, particularly by the Pergamean collection, amounting to 200,000 volumes, presented by Mark Autony to Cleopatra, till it at length surpassed the former in the number and value of its contents. When the temple of Serapis was destroyed, in A.D. 390, by Theophilus, patriarch of Alexandria, under Theodosius the Great, a great part of the library was destroyed or lost; but it was not till the taking of Alexandria by the Barait was not till the taking of Alexandria by the Saracens, in 642, that it was utterly destroyed. It is said that when Amrou, the victorious general, applied to the caliph Omar for instructions regarding the library, he was answered,—" If these writings of the Greeks agree with the Koran, or Book of God, they are useless, and need not be preserved; if they disagree, they are pernicious, and ought to be destroyed." Accordingly it is said the works were sembyed to her cordingly, it is said, the works were employed to heat the 4,000 baths of the city; and such was their number, that they lasted for six months.

ALEXANDRIAN MANUSCRIPT, ALEXANDRIAN MANUSCRIPT, Codes Alexandrinus, the name of a Greek manuscript of the Old and New Testaments, now in the British Museum. It was sent as a present to Charles I., from, Cyrillus Lucaris, partirarch of Constantinople, by Sir Thomas Rowe, ambassador from England to the Porte. It is contained in four volumes quarto, of which the New Testament cocupies the last, and is written on veilum, in double columns. The New Testament is, however, less perfect than the Old. It contains all the expensed and most columns. The New Testament is, however, less perfect than the Old. It contains all the canonical and most of the apocryphal books, with several others. Critics are much divided as to the date of this work; but it seems most probable that it was written about the 6th century. A fac-simile of the New Testament was published by Dr. Wolde, in 1786, and more recently one of the Old Testament has been published by the Rev. H. Baber.

ALEXABURIAN SCHOOL.—When ancient Greece lost her glory and independence, literature and science found a refuge in Alexandria, under the munificent patronage of the Ptolemies. Ptolemy Soter, or his successor Ptolemy Philadelphus, established at Alexandria a Museum, whither learned men were invited from all parts, and maintained at the public expense, with every facility for cultivating the various branches of literature and science. At first it was principally distinguished as a school of grammar and criticism, producing correct editions of the ancients, and writing learned commentaries upon them. In poetry, the ALEXANDRIAN SCHOOL .- When ancient Greece lost producing correct editions of the ancients, and writing learned commentaries upon them. In poetry, the writers of this school are distinguished for correctness, purity, and elegance of style; but the more important part, the spirit and genius which characterized the earlier poetry of the Greeks, is almost entirely wanting. In philosophy, the Alexandrian school was a species of eelecticism, being an attempt to blend the systems of the East and West,—to unite the religious opinions of the East with the Greek dialectics. (See Nearly Conveyers ). In the mathematical and whesterl NEOPLATONISTS.) In the mathematical and physical ADDITIONISTS.) In the mathematical and physical sciences this school became very distinguished, having such men as Euclid, Apollonius, Eratosthenes, and Ptolemeus, the geographer. Alexandria continued to be distinguished as a seat of learning until its capture by the Saracens.

ALEXANDRINE VERSE, a species of verse, so called from its being first used in an old French poem on Alexander the Great, belonging to about the 12th century. Ronsard, however, was the first to render it popular, and it is now the regular heroic verse of the French. It consists of twelve syllables, broken into two regular hemistichs, i.e. every sixth syllable ter-ninating a word. In English, the Alexandrine verse is rarely used throughout a whole poem, and the rule of dividing into hemistichs is occasionally violated.

The second of the following lines is an Alexandrine:—

A needless Alexandrine ends the song, Which, like a wounded snake, drags its slow length along."

Argm, dl'.jee (Lat., seaweeds), in Bot., this great class of Thallogens (see this word) comprehends the sea-weeds and the multifarious green vegetable forms of simple cellular structure met with in fresh water and in permanently damp situations. The lumblest members of the vegetable kingdom belong to this class. Aigo are flowerless, and consequently seedless. They are propagated in various ways by reproductive parti-cles, called spores or sporules. The class comprehends cles, called spores or sporules. The class comprehends a vast variety of plants, exhibiting a wonderful multiplicity of forms, colours, sizes, and degrees of complexity in structure. These plants have, however, been arranged into three groups or orders, which have estain striking distinctive characters. These three orders are named \*\*Ehodosporea\*\*, or \*\*Floridea\*\*; \*\*Melicians\*\*, or \*\*red-spored alge\*\*, grow in salt water, and are generally rose-red or purple, rarely brown-red or greensht-red. \*\*Melanosporea\*\*, or dark-spored alga\*\*, are marine plants of an olive-green or brown colour. \*\*Chlorosporea\*\*, or green-spored alga\*\*, are generally green, rarely red or livid purple, found sometimes in sea-water, but more frequently in fresh-water ponds, streams, and ditches, and on damp surfaces. Professor streams, and ditches, and on damp surfaces. Professor series, and citones, and on damp surfaces. Professor Bentley roughly estimates the number of species of signs at 2,500. Many are used for food in different parts of the world, their nutritious properties being due to he presence of starch, mannite, muchage, albumen, and gelose. The ashes of several kinds of sea-weeds form kelp, formerly extensively used for the preparation of carbonate of soda. Iodine is obtained from sea-weeds. None of the plants in this great class are known to be poisonous.

ALGAROBA, or ALGAROBILLA, al-ga-ro-bil'-la, the legumes of a species of mimosa used in the process

ALGAROTH, POWDER OF, M-ga-roth, a mixture of the terchloride and teroxide of untimony invented by Victor Algarotti, a Venetian chemist, formerly much used in medicine.

ALGEBRA, al'-je-bra (Arab. al djaber, i.e. science of restitutions), the science of numbers considered generally. Arithmetic treats of the facts connected with figures, algebra of the laws that govern them; for instance, that 5 multiplied by 4 gives the same product as 4 multiplied by 5, is but an arithmetical fact;

duct as 4 multiplied by 5, is but an arithmetical lact; but to establish as general principle that the product of any two numbers whatever is the same, no matter in what order they be multiplied, is an algebraical proposition. In algebra, numbers are represented by letters. It is a method of performing calculations of all sorts of quantities by means of general signs or characters.

Known quantities are generally represented by the first letters of the alphabet, as, a, b, c, &c. Unknown,

by the last; as, x, y, z. The sign + (plus or more) is the mark of addition. Thus, a + b means that the quantities represented by a and b are to be added together. When no sign is prefixed, + is understood.

The sign — (minus or less) denotes subtraction; as, a-b, that is, the number represented by b is to be subtracted from that represented by a.

Quantities with the sign + prefixed are called posi-tive or affirmative; and those with the sign - negative quantities.

The sign  $\times$  (or multiplied by) denotes multiplication; as,  $5 \times 4$  means that 5 is to be multiplied by 4.

is the mark of division; thus,  $a \div b$  means that a is divided by b.

A number prefixed to a letter is called a numeral pefficient. When no number is expressed, I is under-

coefficient. With no number is expressed, I is understood; i.e., I is the numeral co-efficient of such letter.

A simple quantity consists of one purt or term, as

# a, --de; a compound quantity of more than one, connected by the signs + or -; as, a + b, a - b + c, are compound quantities. If there are two terms, it is called a binominal, if three, a trinominal, &c.

Like quantities consist of the same letters repeated;

thus + ab, - bab, are like quantities; but + ab, and + ab are unlike quantities.

The powers of algebraic quantities are expressed by placing a small figure (equivalent to the number of factors, and called the index or exponent of the power) at the right-hand side of the letter. Thus axa, or the

square of a, is expressed by  $a^3$ ;  $b \times b \times b$ , or the cube of b, is expressed by  $b^3$ ;  $x \times x \times x \times x$ , or the fourth power of x, is expressed by  $x^{a}$ ;  $a + b \times a + b \times a + b$ , or the cube of a + b, is expressed by  $a + b|^3$ , and so on.

The roots of quantities are expressed by the sign  $\checkmark$ .

with the proper index annexed: thus;  $^2\sqrt{a}$ , or  $\sqrt{a}$  expresses the square root of a;  $^3\sqrt{b}$ , the cube root of b;  $\sqrt{u+x}$ , expresses the biquadrate root of a+x, &c.

The sign = placed between two or more quantities, expresses the equality of such quantities; thus, a + bexpresses the equation of such quantities; when x = c + d, means that a + b is equal to c + d; and ax + by = cx + dy = 2x + fy, mean that the quantities ax + by, cx + dy, and ex + fy, are all equal to each other

other. In algebraical operations the word therefore, or coasequently, often occurs. To express this word the symbol  $\cdot$  is commonly used; thus, the sentence, "therefore, a+b is equal to c+d," is expressed by  $\cdot$ . a+b=c

The symbol 7 placed between two unequal quantities signifies that the first is greater than the last; thus, a > b, intimates that a is greater than b; but when the character is inverted, it signifies that the first quantity character is the second: thus,  $a \ge b$ , intimates that a is

The operations of algebra are the same as those of arithmetic,—addition, subtraction multiplication, divi-sion, extraction of roots, &c. In its application to the resolution of problems, the problem must first be translated out of common into algebraic language, by ex-pressing all the conditions and quantities, both known pressing an ine conductors and quantities, our known, and unknown, by their proper characters, arranged in an equation (see EQUATIONS), or several equations, if necessary, and treating the unknown quantity as if it were a known one: this forms the composition. Then the resolution, or analytic part, is the disentangling the unknown quantity from the several others with which it is connected, so as to retain it on one side of the equation, while all the known quantities are collected on the other side. This process is called analysis or resolution; and hence algebra is a species of analytic art. The mode of applying algebra to the resolution of problems may be seen in the following example:—From the given sum and difference of two numbers, to find the numbers themselves. Let x and y be the numbers, and a and b their sum and difference respectively:-

$$\begin{array}{l} x+y=a \text{ and } \\ x-y=b \end{array}$$

Adding the quantities on both sides of the symbol=. we have-

$$2x = a + b$$
$$x = \frac{a+b}{2}$$

Again, subtracting the quantities on both sides of the symbol -, we have-

$$2y = a - b \text{ and }$$

$$y = \frac{a - b}{2}$$

and hence arises the general algebraical trath, that the greater and less of two numbers are respectively equal to half their sum and half their difference. For particular cases, we have only to substitute the respective numbers instead of a and b, in order to have immediately the corresponding values of x and y. The origin of algebra cannot be determined with exactitude. In the middle of the 4th century, when the mathematical sciences were declining, Diophantus wrote a treatise on arithmetic, in thirteen books, of which seven only remain ton. Hypatia, the daughter of Theon, who fell a victim to the fury of a mob, in the early part of the 5th century, wrote a commentary on the work of Diophantus: this, however, is also lost. In the 16th century, the works of Diophantus were And hence arises the general algebraical truth, that the on the work of Diophantus: this, however, is also lost. In the 16th century, the works of Diophantus were discovered in the Vatioan library at Rome. They were written in the Greek language, and were translated into Latin by Xylander, in 1875. A more complete translation, by Bachet de Mezeriac, appeared in 1821. In 1870, the French mathematician Fermot published notes of his own on the writings of Diophantus. The important invention of algebra, as well as numeral characters and decimal arithmetic, was first made

known in Europe by the Arabians, who had col-lected the works of the Greek mathematicians, and translated them. By means of the Arabic tongue, Euchid was first introduced into Western Europe. The Arabians award the invention of algebrate their famous mathematician Mahommed-Ben-Musa, or Moses, who was also called Mahommed of Buziana, in the 9th century, a copy of whose treatist on the subject is preserved in the Rodleian library at Oxford. The science of algebra was originally introduced into Italy by Leonardo, a merchant of Pisa, who had spent his youth in Barbary, and there become acquainted with the Indian method of computing by nine numeral characters. He composed a treatise on Arithmetic in 1202, which he afterwards revised in £223, two centuries before the invention of printing. The manuscript was discovered in the middle of last century, in the Magliabecchian library at Florence. The first book on algebra that ever was printed was written by Arabians award the invention of algebrato their famous in the highlancechian intrary at Forence. The area book on algebra that ever was printed was written by Lucas Paciolus, or Lucas de Borgo, a Minorite friar. It appeared in 1494 and again in 1523. It is called "Summa de Arithmetica, Geometria, Proportione, et Proportionalita." Not only are we indebted to Italy for the first European knowledge of algebra, but it was there that it received its earliest improvements at the hands of Scipio Ferreus, Florido, Tartalea of Brescia Cardan, Lewis Ferrari, and Bombelli. Stifelius and Schenbelius, two German mathematicians, were con-temporary with Cardan and Tartalea. Stifelius introduced the characters which denote addition and subtraction, and the symbol for the square root. first treatise on algebra, in English, was from the pen of Robert Recorde, a mathematician and phy-sician of Cambridge. Vieta was the first who intro-duced general symbols, applicable to all problems of the same kind, without the labour of repeating the the same kmd, without the labour of repeating the same process of analysis for each; thus happily applying algebra to geometry.—Ref. Bonnyeastle's translation of Bossut's Historice des Mathématiques; the Historics of Montucla, Corsali, and Libri; and Hutton's Mathematical Tructs.

ALGORITHM, all-go-rithm, derived from the Arabic, the root being a word which means or refers to calculation or reckoning. Among many authors, and especially the Spanish, the word is naturalized, as meaning the science of numbers, or system of notation: thus, there is an significant of the differential calculus, an algorithm of function, &c. Though sometimes used by English writers, our language does not need it, the

word notation being an exact equivalent.

ALGUACII, al-gwa'-zeel, in Spain, is the general name of officers for the apprehension of criminals. The alguacil-mayor is a higher officer, with similar

functions.

Almadi, il-hai'-gi, in Bot., Camel's-thorn, a gen. of leguminous plants in the sub-ord. Papilionaece. The species A. macroma, a native of Persis, yields a kind of manna, which is used as food for cattle. The manna is obtained by shaking the branches of the

trae. ALHAMBRA, W-ham'-bra (a corruption of ARRAMBIA, dl.ham'-bra (a corruption or the Arab. kalat al-hamra, the red castle), the name of a celebrated fortress, which formed the acropolis, or citadel, of the city of Granada, and in which was situate the palace of the ancient Moorish kings of Granada. It was fortified in the strongest manner, and was causable of containing 40.000 man. The Grandas. It was fortined in the strongest meaner, and was capable of containing 40,000 men. The emperor Charles V. also commenced erecting a palace within its walls, but it was never finished. The fortress is surrounded by noble woods and delicious gardens; the wall which encompasses it being more than a mile in circuit. The magnificent Moorish palace inside the wall was commenced by Ibnu-l-almer, in 1248, and continued to receive additions during the next hundred years. Portions of this building still remain, and dred years. Portions of this building still remain, and are at the present day called by the Spaniards the Casa Real. The Court of the Lions is the grand apartment of the palace; it is so termed from a splendid fountain, supported by lions, entirely built of marble and alabaster, and ornamented with the most graceful fretwork and arabesques. The court is 100 feet long, by 50 broad, and has 128 columns of white marble. The windows are chiefly towards the interior, the Arabian accidence for this rior, the Arabian architect giving his reasons for this peculiarity of construction in an inscription reading

thus:—"My windows admit the light and evaluate the view of external objects, lest the beauties of Metare should divert your attention from the beauties of my work." Over the walls, ornaments are profusely scattered, in colours of gold, pink, light blue, such dusky purple. Although no longer inhabited, this beautiful example of medieval architecture is preserved as a work of art, and is placed under the obserge of a governor and a number of invalid soldiers. Some of its beauties have been reproduced in the "Albambra Court" of the Crystal Falsce at Sydenhambra Court" of the Crystal Falsce at Sydenhambra (works of Washington Irving for its history, and Owen Jones's Albambra for a complete description of its ornamentation and architecture.

Albambraic, al-kam-brai-ik, a term given to a par-

ALHAMBRAIC, al-ham'-brai-ik, a term given to a particular style of ornamental art, which is founded upon the decoration of the celebrated Moorish palace of the Albambra, at Granada (see ALHAMBRA). In this style all imitations of men and animals are omitted, while the floral and vegetable forms employed bear only a distant resemblance to nature. Rich metallic elabora-tion and gorgeous colouring are the chief character-istics of the Albambraic style; but, so exquisite was the taste of the Moorish artists who invented it, that

it was always harmonious.

ALIAS (Lat., otherwise), a word used to denote a name or title that has been assumed by, or accidentally given to, a person; as, Thomas, alias Jones. An alias may be assumed by any one, but does not absolve him from the responsibility of an act committed under his assumed name. It is also a second writ issued from the courts at Westminster, where the first has been issued, and returned without effect.

ALIBI, "il'-i-bi (Lat., elsewhere, in another manner), in Law, is a term used to express that defense in a criminal prosecution, where the party accused, in order to prove that he could not have committed the crime charged upon him, offers evidence that he was in a different place at the time of its commission.

ALIEN, ai'-li-en (Lat. alienus, another man's, of another country), generally speaking, is one born in a foreign country, out of the allegiance of the king or other executive of that in which he is for the time resident or staying. In order to ascertain the nature of an alien, it will be better to consider who are natural-born English subjects. They are persons born within the allegiance, power, or protection of the erown of England, which terms embrace not only persons born within the dominions of her majesty or of her homagers, and the children of subjects in her service abroad, and the queen's children and heirs of the crown, all of whom are natural-born subjects by the common law, but also under various estatutes, all persons, though born abroad, whose fathers or gradfathers by the father's side were natural-born subjects at common law, unless the father or paternal grandat common law, unless the father or paternal grand-father through whom the claim is made was, at the time of the birth of such children, liable, in case of his return into this country, to the ponalties of treason or felony, or was in the service of any foreign prince then at cumity with the crown of England, excepting always from the benefit both of the common law and the statutes those artificers and manufacturers who are declared aliens by 5 Geo. I. c. 27. Artificers, however, may now go abroad (5 Geo. IV. c. 27). Persons born in transmarine territories belonging to the queen of England in any other right than that of the English crown (as formerly the Hanoverians), and persons doing service to the queen as officers of transmarine territories, are not natural-born subjects. A child born out of the allegiance of the crown of England is not entitled to be deemed a natural-born subject, unless the father be, at the time of the birth subject, unless the father be, at the time of the birth of the child, not a subject only, but a subject by birth. An alien born could not, till lately, hold anything except a lease of his house. But now, by 7 & 8 Vict. c. 66, s. 3, every person born out of her majesty's dominions, of a mother being a natural-born subject, is capable of taking and holding any property, and by sec. 5, every alien residing in any part of the United Kingdom, and being the subject of a friendly state, may take and hold any lands or tenements for the currence of residues or coursetion by him or his the purpose of residence or occupation by him or his servants, or for business purposes, for a term not exceeding twenty-one years. A liceuse to purchase,

take, or hold property may, however, be obtained from the crown. An alien cannot sit in parliament or privy council, nor hold grants or offices of trust under the crown, nor act as a juryman, except in cases where an alien is to be tried, who is entitled to have a jury composed of half Englishmen and half foreigners. An alien enemy is the subject of another state at actual war with our own, and does not possess even the bare right of residence, or the power of enforcing any contract or suing for any debt due to him. But where a foreigner is resident in England, and afterwards a war breaks out between his country and ours, his goods are not fable to be seized; and if a contract be made with him during peace, the right of action is not absolutely forfeited by the occurrence of a war, though it is suspended. As to the removal of disabilities

though it is suspended. As to the removal of disabilities of alien friends, see DERIZATION, NATURALIZATION, ALIENATION, ai-li-e-nai'-shun (Lat. alienatio, alieno, I alienate, pass away, discard), in Law, any method whereby estates are voluntarily resigned by one man and accepted by another, whether it be by sale, gift, marriage settlement, devise, or other transmission of property, by the mutual consent of the parties. All persons are prima facic capable both of conveying and purchasing, unless the law has laid them under any particular disabilities. Ecclesiastical persons are enabled, for particular purposes, and subject to certain conditions, and by consent of proper parties, to make conditions, and by consent of proper parties, to make dispositions of their benefices. Such lay corporations as are called municipal (viz., corporated towns) may dis-pose of the corporation estates, with the approbation pose of the corporation estates, with the approbation of the lords of the Treasury, or any three of them, and on such terms as they may think fit to approve. Lay corporations aggregate, in general (subject to the restraint imposed on such as are municipal), have a right to alienate freely their lands of inheritance. Conveyances by idiots and insane persons, except during a lucid interval, are void, except feedlments, which are only voidable. Conveyances by infants are in general not void, but voidable, either by themselves in general not void, but voidable, either by themselves in their lifetime, or by their representatives after their death; but if confirmed by the infant on coming of age, cannot afterwards be impeached by his repreage, cannot atterwards be impeaced by his repre-sentative. Their disposition by will is, however, void altogether. Conveyances by persons under duress are voidable, and may be affirmed or avoided when the duress ceases. Conveyances of her estate by a married woman (except as far as regards her equitable interest in land astigld to her senerate use) are absolutely

woman (except as far as regards her equitable interest in land settled to her separate use) are absolutely void, unless made in such particular method as the law has specifically appointed for the purpose.

ALIMENTARY CANAL, or DUCT, āl-i-meni-ta-re (Lut. alimentum, nourishment, food), is the name given to that great canal or conduit in animal bodies through which the food passes from the mouth to the anus. It distinguishes animal from vegetable life, plants having no common receptacle for their food nor canal for carring off the excrements. In the human sub-

having no common receptacle for their food nor canal for carrying off the excrements. In the human subject, it comprises the pharyux, esophagus or gullet, stomach, and large and small intestines, being, in a full-grown individual, nearly forty feet in length.

ALTMENTS, W-i-ments (Lat. alimentum, from clo, I nourish), a term applied to those substances which, upon being taken into the stomach, are capable of affording nourishment to the body. Every aliment must be derived from either the animal or vegetable indoor as the expective of affording nourishment to affording nourishment to the body. Every aliment must be derived from either the animal or vegetable kingdom, as the capacity of affording nourishment to the animal system would appear to belong exclusively to organized matter, or that which has possessed life. Nevertheless, certain substances appertaining to the inorganic kingdom, although incapable of themselves to form an aliment, have yet the power, when taken in conjunction with aliments, of assisting in the process of mutrition. These inorganic substances are principally water, salt, lime, &c. Aliments have been distinguished into nine classes. The first, or Furinaceous class, includes barley, wheat, oats, rice, maize, potatoes, haricots, lentils, peas, &c. The second, or Musilaginous class, comprehends melons, cabbages, turnips, beet-root, carrots, asparagus, &c. The third, or Sweet class of aliments, includes dates, spricots, dried grapes, figs, the various sorts of sugars, &c. In the fourth, or Acidulous class, there are grapes, strawberries, raspherries, mulberries, pears, prunes, spples, cherries, oranges, gooseberries, &c. In the

fifth, or Fatty class, there are snimal fats, oils, butter, fifth, or Futty class, there are animal fats, oils, butter, cocos, nuts, walnuts, olives, sweet almonds, &c. The sixth, or Cassous class, includes the various sorts of milk, cheese, &c. In the seventh, or Gelatinous class, there are, several kinds of fish, the flesh of young animals, calf's-foot, &c. In the eighth, or Albuminous class, there are included brain, eggs, &c. The ninth, or Fibricous class, codiprehends the flesh and the blood of various animals. To these nine divisions a tenth may be added, comprehending the Condiments, as pepper, salt, mustard, vinerar, horseradish, &c. as pepper, salt, mustard, vinegar, horseradish, &c. Certain liquids, or *Dribks*, should also be reckoned among the aliments, as water of various kinds (springwater, well-water, river-water), the infusions of tea and coffee; the various kinds of fermented liquors, as oider, perry, beer, wine, &c.; the alcoholic liquors, as gin, whisky, brandy, &c. As a rule, aliments require to be prepared by cooking, so as to be made more agreeable to the palate, or more easy of digestion, but few aliments being used in an undressed or natural condition. Ref. Hooper's Levicon Medicum; Mrs. Beeton's Book of Household Management.

ALMONY, nl'-i-mun-e (Lat. alimonia, sustenance), in Law, is a provision made for the support of a wife pending a suit instituted by her or her hushand, either for a dissolution of marriage or a judicial separation. By the Divorce Act, 20 & 21 Vict. c. 85, s. 32, the Court on Divorce may order the hushand to secure to the wife a sum of marriage. Vict. c. 83, is. 32, the Court on Divorce may order the busband to secure to the wife a sum of money, in gross or by annual payments, for any term not exceeding her own life, as, having regard to her fortune, the ability of her husband, and the conduct of the parties, it shall deem reasonable, and to enforce this by deed. The court has also the power, pending the suit, to make interim orders for payment of money to the wife, by way of alimony or otherwise. If the suit be instituted by the bushand the court can assenged its decrease. tuted by the husband, the court can suspend its decree

until the provision be secured.

ALIQUANT PART, al'-i-kwant (Lat. aliquanta pars), in Arith, a number which cannot measure any other without some remainder. Thus, 5 is an aliquant part of 12; for twice 5 wants 2 of 12, and three times 5 exceeds 12 by 3. The exact reverse of aliquot.

ALIQUOT, \(\vec{d}t^2 - i k vot \) [Lat. aliquoties, how many times, a restrict the footbase of footbase which display no the north annual and the second footbase of footbase which display no the north annual and the second footbase of footbase and the second footbase of footbase and the second footbase of footbase of

a number or fraction which divides another number or a number of rection wind divides another number of fraction, without leaving a remainder. Thus, 6, 4, 8, 2, 1\frac{1}{2}, \frac{3}{2}, and \frac{1}{2}, are aliquot parts of 12, being contained in it 2, 3, 4, 6, 8, 28, and 96 times. At one time aliquot parts, expressed by vulgar fractions, were frequently used in arithrectic; but, now, the employment of decimals has, to a great extent, superseded their received. their use.

ALISMACKE, &i-is-mail-se-e, in Bot, au ord. of monocotyledonou. plants, in the sub-class Petaloidea. Swamp or noting plants, with parallel-veined leaves. Swamp or docting plants, with parallel-venued leaves, Their flowers are perfect, or very rarely uniexual. The perianth is inferior, that is to say, it does not adhere to the ovary, and is arranged in two whorls, each consisting of three parts; the outer whorl being green, the inner coloured. The stamens vary in number, and there are several ovaries. Plants belonging to this order are principally found in the northern parts of the world. The typical genus is Alisma, the waterplantain, some species of which are well adapted for accuration.

ALIZABINE, a-liz'-a-reen, the pure coleuring matter madder. Purpurin and garancine are also found in of madder. It this dye-stuff.

of mader. Aurylin and garanese are also found in this dye-stuff.

Alkahrer, & W-ka-kest, in Alch., a term applied to the long-sought-for universal solvent, or menstruum of the ancient chemists, touching which Kunkel asks,—"If it dissolve all substances, in what vessels can it be contained?" There is little doubt but that the alchemists had sufficient sense to ask the same simple question. Paracelsus, Van Helmont, and Glauber call sulphate of ammonia by this name, but they never pretended that it was universal solvent. The derivation of the word is, according to some, from the Arabic; according to others, from the German al, all, and geist, spirit.

ALKALI, & W-ko-H (Arab. al-kali, acds).—This term is applied, in Chem., to a class of substances characterized by the energy with which they combine with acids, by their acidity and caustic property, and by their sotion on vegetable colours. The ancient chemists

## Alkalimeter

included only three substances under this name,—vegetable alkali, or sods; mineral alkali, or potash; and volatile alkali, or ammonia. To these modern chemists add three alkalies proper—lithia, casis, and rubidia, and the alkaline earths—lime, strontia, baryts, magnesia, and a number of othefs too rare to need mention. With the exception of ammonia, these alkaline are all oxides of metals, called alkaline alkaline are all oxides of metals, called alkaline baryts, magnesia, and a number of others too rare to need mention. With the exception of ammonis, these sikalies are all oxides of metals, called alkaline and alkaline-earth metals. The pure form of these oxides is called the caustic state, from the burning properties possessed by them all when not combined with any soid. When they, are in combination with carbonic scid, which is a very weak acid, they are said to be in their mild form, and still preserve, in a minor degree, many of their characteristics as alkalies. Many vegetable substances, such as bark, opium, nightalase, and others, possess crystalline principles which, from behaving like alkalies, have been named alkaloids. Quinine, morphine, and atropine, are examples of these. Most of them form salts with acids; for instance, we have desulphate of quinine, accetate of morphine, and aco on. acetate of morphine, and so on.

ALKALIMETER, ül-ka-lim'-e-ter (Arab. al-kali, and Gr

metron, a measure). (See Alkalimeter.)
Alkalimetry, ăl-ka-lim'-e-fre, the art of determining

the proportion of caustic alkali, or alkaline carbonate, contained in commercial potash or sods, upon the amount of which depends their value for manufacturing purposes. The method by which this is effected, is by adding to a certain amount of the potash or soda dis-

adding to a certain amount of the potash or soda dis-solved in water, enough dilute sulphuric acid of definite strength to exactly neutralize the alkali, and noting this quantity. For instance, if it is found that one dram of the test acid will neutralize seven grains of pure alkali, it is evident that, if six drams are required to neutralize fifty grains of impure potash, there are only forty-two grains, or 84 per cent., of pure alkali in sample, the other 16 per cent. being combined with another acid, or replaced by some neutral compound.
ALKALINE EARTHS.—Baryta, stroutia, and lime are

so called to distinguish them from the earths proper. Their solutions are alkaline to test-paper, and their carbonates are insoluble in water; this latter fact dis-tinguishing them from the alkalies proper, magnesis, and alumina.

and alumins.

ALKALOIDS, VEGETABLE, &l'-ka-loids (Arab. al-kali, Gr. cidos, likeness).—The discovery of these substances is one of the most remarkable of modern chemistry. They are salidable bases, found in various vegetable substances, and are similar in their actions to the mineral alkalies mentioned above, uniting with acids to form salts. They are all violent poisons, highly nitrogenous, sparingly soluble in water, but more so in alcohol and dilute acids. They are prepared by boiling the substance containing them in dilute hydrochloric acid, neutralizing by a mineral alkali where the chloric acid, neutralizing by a mineral alkali where the alkaloid is precipitated in an insoluble form. The follakalond is precipitated in an insolution form. The for-lowing is a list of the principal vegetable alkaloids, and the substances from which they are derived. They are of the greatest value in medicine, the exhibi-tion of the fraction of a grain being attended with the most marked curative results. They are often found in books with the termination ine instead of ia, the latter being the more correct.

Morphia, from opium. Quinia Cinchonia from Peruvian bark. Strychnia, from nux vomica. Veratria, from hellebore. Atropia
Hyocyamia } from belladonna.
Nicotnia, from tobacco.
Accnita, from aconite.

ALEANET-Root, all-ka-net, a dye-stuff, giving a red colour, used for staining woods and for colouring oils and spirits used in perfumery. It is the root of the plant named by botanists Anchusa tinctoria.

ALKORAN. (See KORAN.)
ALLA, al'-la (Ital., in the), a term used adverbially ALLA, ac-ta (tast., in the), a term used advertinally it is sometimes the interior in Mus., in various ways; as, Alla or Al-antica, 'in giving a lively or interior the lold style,' as applied to compositions of a preceding age, no longer fashionable. Alla-breve, 'quick time,' wherein the notes take but half their general a term used in Mus. to d length; the noble fugue in the "Messiah," entitled quick as that of allegro.

# Allegretto

"And with his stripes we are healed," is written in this measure. Alla Capella, 'in the charch style.' Alla Zoppu, or Alzop, 'in an affected style.' Alla- or Al-loco, 'in its place,' a term which denotes, in violin music, that the hand, having been shifted, mustretura to its position. Alla- or Al-attavo, 'in the octave,' applied to voices or instruments where the parts lie, note for note on octave above or below. Alla-

applied to voices or instruments where the parts lis, note for note, an octave above or below. Alla- or Al-resersa, 'the reverse,' applied to parts in a contrary direction. Al-improvista, 'extemporaneous.'
Allah, all-la (Arab. al, the, and idah, deity), is the Arabic name of the Supreme Being, which, through the Koran, has been adopted by all nations that have embraced the Mohammedan faith.

embraced the Mohammedan faith.

ALLANTE, in Min. (See ORTHITE).

ALLA PRIMA, al'-la pre'-ma (Ital., all at once), in Paint., a term applied to that method of applying all the colours upon the canvas at once, without any retouching. Many of the finest works of the old masters were painted in at once in this way; but the method demands too much artistic skill, knowledge, and decision to be generally employed.—Ref. Hundertpfund's Art of Painting restored.

All Jerust A PROUSE All Leavest (Car. all attempts)

ALLECEET ARMOUR, all-le-oret (Ger., all-strength),

a convenient armour, much worn in the 16th century. It consisted of a casque, breastplate, and gussets, which sometimes reached to the middle of the thigh. and sometimes below t knees. The Swiss were the first infantry that cased themselves in steel; and so famous did they become, that the opinion respecting foot-soldiery underwent a total change, and the services of the Swiss infantry were eagerly sought by all the continental monarchs. In the paintings and prints of the period the Swiss soldiers are commonly depicted in this armour.

ALLEGIANCE, al-le'ad ligare, to bind to), is the natural, lawful, and faithful obedience which every subject owes to his prince. It is either per-petual, where one is a subject born, or has the right of a subject by naturalization, &c.; or it is temporary, by reason of residence

ALLECRET ARMOUB.

rary, by reason of residence in the state or country. To subjects born, it is an incident inseparable, and as soon as born, they owe, by birthright, obedience to their sovereign; and it cannot be confined to any kingdom, but follows the subject wherever he goes. The subjects are hence called kiegs people, and are bound by this allegiance to go with the king to his wars as well within as without the kingdom. dom. By the common law all persons above the age of twelve years were required to take the oaths of allegiance in courts-leet; and there are several sta-tutes requiring such oath to be taken on being ap-

pointed to certain offices, and otherwise.

Allegory, di-le-gor-s (Gr. allegoria, a parable), in Rhet., is the description of a subject, or the representation of a train of thought by means of another sentation of a train of thought by means of another subject having similar properties. Thus Menenius Agripps made use of an allegory when, in addressing his fellow-citizens at Rome, he described their rebellion under the figure of a conspiracy of the several members of the body against the stomach. Allegory has been a favourite mode of expression in all ages and countries, particularly among the Orientals; and it is sometimes the fittest or most available means of giving a lively or intelligible representation of certain

ALLEGRETTO, al-lai-gret'-to, the diminutive of allegro, a term used in Mus. to denote that the time is not so

45

## Allegro

ALLEGRO, al-last-gro (Ital., merrily, sportively), in Mus., a term denoting the third degree of quickness. It is also used in combination with other terms; for example, allegro agliato, quick and agitated; allegro furios, vehemently quick; allegro assai, more quickly; allegro non molto, not very quickl; allegro deside, but not exvery quick; allegro ma non presto, quick, but not ex-

ALIMMANDE, al-le-mand' (Fr., German), a term applied to a dance supposed to be of German origin; whence the name. Formerly it was a slow dance; but at the present time it is understood to be moderately quick. By Handel and others of his contem-

poraries it was composed in four-crotchet time.

ALL-Fours, awl-fores, a game of cards, played usually by two persons, but sometimes by four, with a complete pack, and so named from the four chances therein, for each of which a point is scored, and which, joined in the hands of either of the party, are said to make all fours. The chances are,—high, the best trump out; low, the smallest trump dealt; Jack, the insre of trumps; game, the majority of pips reckoned from such of the following cards as the respective players may have in their tricks,—every ace counting lk king 3, queen 2, knave 1, and ten 10. Low is always scored by the person to whom it is dealt; but Jack, being the property of whoever can win or save it, the possessor is allowed to revoke and trump with that card, and, when turned up as trump, the dealer scores. It is also allowable for the player who lays down a high or low trump to inquire whether the same be high or low. After cutting for deal, six cards are given to each player, and the 13th turned up for trump. If the eldest does not like his cards, he may, for once in a game, say I beg, when the dealer must either give a point or three more cards to each, and turn up the 7th point or three more eards to each, and turn up the 7th for trump; but if that should prove of the same suit as the first turned up, then three more cards are to be given; and so on, till a different suit occurs. The cards are to be given; and so on, till a different suit occurs. The cards are the same below.

given; and so on, till a different suit occurs. The eards cank as at whist, and each player strives to secure his own tens and court cards, or to take those of his adversary. Ten or eleven points form the game.

ALLINGE, äl-li'-anse (Fr. alliance), in International Law and Pol., a league between two or more friendly powers. An alliance may be either offensive and defeasive or defensive only. Politicians divide them into three classes, those for which the allied states undartake to prosecute a war with their whole force; these in which the stripes of the second those in which auxiliary states furnish a principal state with a certain fixed contingent of men, arms, money, &c.; and those in which one power undertakes to furnish troops to another power for stated sub-

ALLIGATION, öl-li-gai'-shun (Lat. ad, and ligare, to bind together, or unite). A rule of Arith, by which the price of a mixture is found when the cost of the ingredients is known. This rule is divided into two cases,—alligation medial and alligation alternate. The cases,—alligation medial and alligation afternate. The following question would belong to alligation medial. Suppose 8 gallons of brandy, at 24s. per gallon, to be mixed with 12 gallons at 34s. per gallon, what would be the price of a gallon of the mixture? But if the question were reversed, and it were required how many gallons of brandy, at 34s. per gallon, must be mixed with 8 gallons at 24s. per gallon, to make the cost of the mixture 30s. per gallon, it would belong to alligation at the cost of the mixture 30s. per gallon, it would belong to alligation. atternate. Questions of this sort are most easily re-solved by the use of elementary algebra. Alligator. (See Choconile Family.) Alligator Toutouse. (See Tortoise.)

ALLITERATION, al-tit'-e-rai'-shun (Lat. ad, to, literu a letter), an ornament chiefly used in poetry, consisting of the repetition of the same letter at certain intervals; as,

"Apt alliteration's artful aid : "

An Austrian army, awfully array'd, Boldly, by battery, besieged Belgrade."

In Anglo-Saxon, Scandinavian, and old German poetry, alliteration served a purpose similar to that of rhyme In modern verse.

ALLEUM, all-li-um (Lat., garlie), in Bot., a gen. of lants belonging to the nat. ord. Liliacem, the Lily ribe. Many species are very familiar plants, being to take several allotropic forms,

# Allotropism

largely cultivated for the sake of their nutritious and piquant bulbs; such are Allium Cepa, the oniou; A. sativum, the garlic; A. Porrum, the lock; and A. accalonicum, the shalot. All the species are characterized by a girong, and, to most people, an extremely disagreeable odour. Allium ursinum, the common ramps of our meadows, diffuses its peculiar odour threath the six of the s through the air, and imparts its unpleasant flavour to the milk of the cows that feed upon it. The substance which gives the garlie and onion their pungent smell and flavour is a compound oil, called by chemists sulphide of allyle. (See ALVILE.) In England, the onion is used much more frequently than any other species. In France, the garlie is held in great esteem, and employed to flavor allowed transport of the second more than any other species. species. In France, the garite is neat in great esteem, and employed to flavour almost overy savoury disk. In Spain and Portugal, the two bulbs are employed rather as every-day articles of food than as more condiments; while the Arab, Moorish, and Ethiopian tribos are even greater devourers of garlic and onions than the inhabitants of the Peninsuls. Among the ancient Egyptians the onion formed an object of worship, and their median descendants assign it a place in their Egyptians the onion formed an object of worship, and their modern descendants assign it a place in their Paradise. The different species of Allium, when cultivated in warm climates, lose much of their pungency; hence the mild flavour of the Spanish onion. The builb of the common gaclic, Allium soticum, though rarely used by the medical practitioner; is known to have properties which might render it a valuable agent in the treatment of some diseases. When taken infermally, it is tonic stipulant expectorant and directions. nally, it is tonic, stimulant, expectorant, and diuretic. Externally it acts as a local irritant and resolvent, and is employed as an antispasmodic limiment for infantile convulsions.

ALLOCATION, öl-lo-kai'-shun (Lat. allocatio), admit-ting an article of account, especially in the Exchequer.

It is, more properly, a placing or adding to a thing.

ALLOCATUR, ill-lo-kai'-lar (Lat., it is allowed), in
Law, a practical term applied to the certificate of
allowance of costs, by the master of the court, on taxation.

ALLOCHROITE, al-lok'-ro-ite, in Min., a variety of

Allocinoitis, actor-ro-ue, in lain, a variety of garnet. (See Garnet.)

Allocition, al-lo-ku'-shun (Lat. al, for ad, to, and locatio, a speaking), is an address, usually of a formal nature, and particularly applied to an address delivered by the pope at the College of Cardinals, on matters of importance to the Church.

ALLODIUM, al-lo'-di-um (Lat. from the Ger. particle an, and lot, land obtained by lot).—When the barbarons nations had invaded the Roman empire, the vassal's estate became certain for life, then went to all vissas sestate became certain for int, then went to as his descendants. Opposed to feudal property, is allodium, which is a possession held in absolute independence, without any acknowledgement of a lord paramount. There are no allodial lands in England, all mount. There are no allodial lands in England, all being held, either mediately or immediately, of the queen. Allodium obtained among our Saxon ancestors, and gave birth to gavelkind (which see). Instances of the term occur in Domesday Book, where it signifies a free manor; and Aladorii, lords of free manors, or lords paramount. — Ref. 1 Co. Litt. 5; Cowell; Blount; Rob. vol. i. ch. v. note 8.

ALLORIANR, ill-lo-fain (Gr. allos, other, phaine, I appear), in Min, the name given to a clayey mineral, of a pale blue or greenish colour. Chemically, its a hydrated silicate of alumina. It loses its colour before the blowpipe: hence its name.

before the blowpipe; hence its name.

ALLOTHOMISM, dl-lot-ro-pism (Gr. allotropos, capable of being turned from one thing into another), in Chem., a term applied to a modification in the properties of a body, not resulting from chemical combination, but from the arrangement of its molecules. Phosphorus, in its usual state, is a waxy, semi-trans-parent body, of a pale lemon-colour, which is so inflammable that the heat of the hand is sometimes sufficient to kindle it; but, by a simple though dangerous process, this substance can be procured in dangerous process, this substance can be procured in an allotropic state, when it is an infusible substance of a dark-red colour, which will not take fire until heated to 500° F., when it is reconverted into ordinary phosphorus. Again, iodide of mercury, when freshly sublimed, is of a lemon-yellow colour, but it becomes scarlet if pressed or agitated. Sulphur can be made to take searce alluttopic forms. The diamond The diamond.

Alloy.

Alloy.

graphite or plumbago, and soot, are allotropic forms of the element carbon. Silice is soluble in water in one allotropic state, and insoluble in mother. In all these cases, the change of properties is not due to the addition or subtraction of anything, but to some inexplicable molecular action.

Alloy, ill-loi' (Fr. allier, to mix), a natural or artificial mixture of two or more metals. Alloys appear, from the experiments of Boussingault, Crookewitt, Hunt, and others, to be definite chemical compounds. This view is confirmed by several facts. Native alloys generally occur in atomic combination. Alloys are always different in colour, density, and other physical properties to those that would be possessed by a mere mechanical mixture of their constituent metals. Brass, for instance, is a yellow compound of a red and white metal. Speculum metal is so brittle that it may be pounded in a mortar; while its constituents, tin and copper, are malleable metals. The principal alloys will be noticed in detail under their respective metals or names. The word alloy, at one time, was used in a depreciatory sense, and was applied to the mixture of gold or silver with a baser metal; but it has since received an extended signification, meaning the union received an extended signification, meaning the union of two or more metals, except when mercury is one of them, the word amalgam (which see) being used in this case. The principal alloys used in the arts are pewter, brass, bronze, electrum, solder; German and nickel silver; bell, Britannis, gun, speculum, and type-metal. Some metals of little value whilst remaining in their pure state are made useful by the new properties they assume in combination with others. Most alloys are mixtures of no exact proportions; the metals dissolve in one another indefinitely, as sulphuric acid unites with water. Some, however, appear to be combinawith water. Some, however, appear to be combina-tions in equivalent proportions; and of these there are found examples in nature, as of the native gold, which occurs combined with silver, -4, 5, 6, or 12 atoms of gold to one of silver, but never a fractional part of an atom of gold. Alloys are always more fusible than the metal most difficult to melt that enters into their combination, and generally more so than the most easily melted one. Sir Isaac Newton discovered a fusible metal, which melts at different temperatures between 198° and 210° F. Its composition is as follows :- Bismuth

5 or 8 parts, lead 2 or 5, tin 3 parts. These metals melt, the first at a temperature of 476°, the second at about 600°, and the last at 442°. As conductors of electricity and heat, alloys are less perfect that of electricity and heat, alloys are less perfect than the pure metals which enter into their composition; they are also generally more brittle, but their power of cohesion is usually greater than that of either of the metals, the alloy resisting more strongly the force applied to draw a har apart than does a bar of either one of the metals composing it. Metals possess the very curious property in the tendency of one, when melting, to cause any other in contact with it, however infusible, to melt likewise. The easily-melted metals act like fluxes upon those most difficult to fuse. On this property is based the principle of soldering two pieces of metal by means of a third. Their surfaces are fixed together by interposing an alloy which is more fusible than either of the metals to be joined. more usible than etter of the meals to be joined. Gold may be soldered by an alloy of gold with silver or with copper; pieces of silver are soldered by an alloy of silver and copper; articles of copper are soldered with an alloy termed "hard solder," which is composed of brass and a large proportion of zine. At the present time the number of alloys in use are very large, and new and important combinations are being constantly discovered. One of the most valuable is that alloy denominated "Munta's metal;" it is a arge, and new and important combinations are bein vellow metal, containing from 40 to 60 parts of sine with 60 of copper, and is used for sheathing. alloys of which printers' types are made are composed of lead and antimony in proportions varying with the kind of types. Silver is too soft to be used in a pure state; hence it is usually alloyed with copper to give it The standard silver of Great Britain conhardness. narquess. The standard sever of Great Britain consists of silver 11·10, copper 0·90. In France the proportions are, 9·5 silver, and 0·5 copper; trinkets, silver 8 parts, copper 2 parts. The gold coins of Great Britain contain 9·10·66 parts of gold in the thousand, the remainder being mostly copper. The French standard conforms to that of the United States-900 parts fine gold in the thousand. The silver coins of this country contain 925 parts fine metal; the rest is copper. The metals most in use are, excluding platanum, eleven in number. They may be divided into five classes, according to their physical properties:—

Metals.	Hardness.	Melting Point.	Tenneity in pro- portional numb.	Specific Gravity.	
I.—Brittle Metals. Antimony	Scratched by glass	A little above red heat Volatizes below red heat 2:6° C.	Almost nil {	6 70 6 82	
II.—Intermediary Metal. Zinc	Scratched by glass	370° C.	4. 9	7

By increasing the quantity of copper it becomes white and somewhat ductile. Used in making buttons, under the	for gold; the slightest fumes of it are sufficient to alter the ductility of that metal. The alloys are pale-yellow, with a fracture like that of porcelain. Rapid combination by the fa- sion of the two metals. The	Similar to that of antimony.  Of a yellow-green colour.  Alloys brittle. Pale red colour.
SILVEB	name of white copper, or tombac.  85 parts of silver and 14 of arsenic. Greyish-white brittle metal. Takes a high	Have a very great affinity. Alloys always brittle.	Alloys brittle and lameliated. Rather white in colour.
Tin	polish. Arsenic renders lead brittle. The combinations are greyish-white. Not decomposed by heat proving close atomic combination.  Grey, lamellated. Less fusible than tin.	Antimony gives hardness to lead. 76 parts of lead and 25 parts of antimony appear the point of saturation of the two metals. Very much harder than lead. When the proportions of antimony are increased, the alloy becomes very brittle.  The alloys of antimony and tin are as white as tin, much harder, and less ductile. They become brittle when the arsenie is in a large proportion. The alloy formed by 80 parts of tin and 20 of antimony may be made into plates suf-	The alloys of bismuth and lead are less brittle and more ductile than those with antimony, but less hard also. 3 of lead and 2 of bismuth has a colour intermediary between tin and lead. It is very ductile. Very fusible.  Tin and bismuth unite easily in all proportions by fusion. The alloys are harder and more fusible than either of the two separate metals.
MERCURY	Without interest.	ficiently hard to engrave music upon. Without interest. A white gritty metal.	Mercury dissolves a large quantity of bismuth with- out lozing its fluidity. The alloy of 1 of bismuth and 4 of mercury very fusible.

# ALLOYS OF ZINC.

The presence of zine always gives increased hardness to the metals with which it is combined. It is an important circumstance to note that it is volatile, and its oxidation is very rapid, facts which render the making of alloys of zine very difficult. With irea it forms an alloy very difficult of manufacture, one metal being volatile and the other very refractory. With gold it forms alloys of a greenish-yellow, very brittle, and susceptible of taking a high polish. With copper it forms very important alloys; it whitens the colour of the copper, forming an alloy which has a fine golden yellow, much used for the manufacture of imitation gold jewellery. With a larger proportion of zine the colour becomes yellowish-green, and pusses to a greyish-blue when its proportions are more than half of the alloy. These alloys are all more fusible, harder, and less oxidizable than copper. Those which contain a third of their weight of zine are very malleable and ductile at ordinary temperatures, but become very brittle at a slight degree of heat. With silver zine combines easily; it is a brittle bluish-white alley, not comployed in the arts. With lead it produces a metal somewhat hard, and capable of taking a fine polish, without diminishing its malleability; the alloy is also more tough than lead, and its specific gravity is greater than the mean of the two metals. With this forms a metal remarkable for its great hardness and fusibility. With mercury it forms a white, very brittle metal.

"It is not a little curious to find that some of the

coins of high antiquity contain zinc, which does not appear to have been known as a metal before 1280 a.D. Albertus Magnus speaks of zinc as a semi-metal, and calls the alloy of copper and zinc golden marcasite; or rather, perhaps, he means to apply that name to zinc from its power of imparting a golden colour to copper. The probability is, that calanine was known from the earliest times as a peculiar earth, although it was not thought to be an ore of zinc, or of any other metal."—Ure. What is known as galvanized iron cannot be regarded as a true alloy of zinc with iron, Mr. Crawford's process was the first patented in this country. It was described in the "Repertory of Inventions" as follows:—Sheet iron, iron castings, and various other objects in iron, are cleaned and scoured by immersion in a bath of water, acidulated with sulphuric acid. After the oxide has been removed, they are scoured with a piece of the husk of a cocoa-nut. The sheets, or other objects in iron, are then dipped into a bath of melted zinc. The sheets are then dipped into a bath of melted zinc. The sheets are then alowly raised to allow the superfluous zinc to drain off, and are thrown, whist hot, into cold water, on removal from which they only require to be wiped quite dry. If the sheets be very thick, they are heated before being immersed, to avoid cooling the zinc. There are other processes for coating iron with zinc, the chief of which are Mallet's and Morewood's, and Rogers's processes.—Ref. Ure's Diotionary (6th ed.); Watson's Chemical Essays.

### DUCTILE METALS.

# Alloys which they form with themselves, and with the soft metals.

Izow.

Iron and gold form alloys with facility, the alloy being difficult of decomposition. The alloy containing one-twelfth part of iron is of a pale yellow coflour; that composed of a fifth or a sixth is yellowisherey. This last is employed in jewellery under the name of "grey gold." The alloy containing 3 or 4 of iron to 1 of gold is greyishwhite, and very hard. These metals become harder by tempering; the last-mentioned in particular. This alloy might be used in the manufacture of cutting instruments.

COPPER.

It is impossible to obtain a veritable alloy of copper and iron: nevertheless they may be allied by fusion. A tenth part of copper combined with brass gives a homogeneous product, very hard, more tough than brass, and which may eventually be turned to use.

SILVER.

Doubtful. Very little studied.

Gold and copper form alloys in all proportions; the metals being harder than gold; the maximum belongs to the alloy containing an eighth of copper. It is also more fusible than gold and a little less ductile. It is on account of its greater hardness that this alloy supersedes pure gold in coining money, and in the manufacture of jewellery.

Gold and silver mix readily together, but do not appear to form a true combination. The alloys are of a whitishgreen colour; a twentieth part of silver suffices to change the colour of the gold. They are more fasible than gold, very ductile; harder, more elastic, and more sonorous than gold and silver separately. The jewellers often make use of "green gold" composed of 70 parts of gold and 30 parts of silver; this slloy corresponds almost identically with the combination possessing the maximum of hardness.

Silver and copper are easily allied in all proportions. These alloys are largely used in the arts, being almost as ductie as pure silver, at the same time possessing more bardness and clasticity. The colour of the alloys remains white even when the copper forms quite half of the compound. The maximum of hardness belongs to the alloy containing one-fifth part copper.

Soft Metals.

No alloy can be obtained between iron and lead. Alloys very brittle; a twothousandth part of lead suffices to alter the dustility of gold. The alloy containing an eighth per cent. of lead is pale yellow in colour; extremely brittle.

Do not appear capable of forming true alloys.

Lead and silver unite in all proportions; a minute quantity of lead suffices to greatly diminish the ductility of the silver. The alloys are nevertheless ductile to a certain degree; they are likewise more dense and fusible than the metals composing them.

DUCTILE METALS.

Soft Metals.

Alloys which they form with themselves and with the soft metals.

Iron.

The alloys of tin and iron are brittle. A very small quantity of iron as malleability of the tin, it tarnish its colour, and pive it hardness. The alloy composed of 8 Tarts of tin and 1 of airon is partially malleable when cold; when heated it is brittle. It may be out with a pair of shears. Its granulation resembles that of of steel. Its apecific gravity is 7,248. With

GOLD.

The alloys of tin and gold are brittle; they are, however, distinguished by some ductility when the procession of the tin do not exceed one-twelfth. Their colour is pale or almost white.

COPPER.

The alloys of copper and tin are of extreme importance in the arts on account of their great toughness, their hardness, and their fusibility. The alloy composed of 76 parts of copper and 24 of tin is white, very brilliant, and brittle. The alloy composed of 90 parts of copper and 10 of tin is of a sombre yellow colour, more fusible, harder and tougher than copper; less oxi-

SILVER.

The alloys of silter and tin are very hard; a small quantity of tin suffices, to destroy the ductility of the silver

Tim .....

Alloy.

GOLD.

Alloy.

SILVER

10 parts of tin and 1 part of iron an alloy is prepared easily fusible, hard and tough, which may be utilized formany kinds of eastings.

IRON.

COPPER.

dizable in the air, but of little malleability.

Liquid Metal.

MER-

Mercury has no action upon iron. This is why vessels of iron are always used to contain it. The amalgams which may be obtained are without stability.

Mercury has a very decided action upon gold; it dissolves it rapidly, and in great quantity without the resulting amalgam crasing to be liquid. The point of saturation appears to be 2 parts of gold to 1 of mercury. The compound is white, pasty; it crystallizes by slowly cooling.

Mercury and copper form annalgams very difficult of preparation. They are without interest.

Mercury behaves towards silver almost in the same way it coss with gold. An amalgam of silver is employed for the purpose of silver, just as an amalgam of gold is made use of to gild,

SOFT METALS.

Alloys which they form with themselves and with Mercury.

LIN.

LEAD.

Lead and tin form alloys easily, by fusion. The alloys are less white than pure tin, but very much harder. The hardest and toughest metal is composed of 25 parts of lead and 75 parts of tin.

The alloy composed of 33 parts of tin and 67 parts of lead is greyish white in colour, mullcable, more fusible than tin; burns at a red heat. Its specific gravity is 9.55.

It is a remarkable fact that lead increases the hardness of tin.

Liquid Metal.

MERCUEY

Mercury and tin upon being subjected to heat combine in all proportions; even when cold an amalgam is formed. The amalgam formed of equal parts of the two metals is solid. That composed of 10 parts of mercury and 1 of tin is liquid and resembles mercury, but

it flows less freely.

Mercury dissolves lead even when cold by means of trituration. When heat is employed, the dissolving power of the mercury is very rapid. It is capable of absorbing hali its weight of lead without losing its fluidity. The amalgam formed of equal parts of the two metals is susceptible of crystallization.

The remarkable series of experiments made by Professor Faraday and Mr. Stodart, an account of which will be found in the "Philosophical Transactions" and in the works of Professor Faraday, are of the highest interest to the manufacturer and to the student. Bespecting the alloy with silver these experimentalists remark:—"In making the silver alloys the proportion first tried was I silver to 160 steel; the resulting buttons were uniformly steel and silver in fibres, the silver being likewise given out in globules during solidifying, and adhering to the surface of the fneed button; some of these when forged, gave out more globules of silver. In this state of mechanical mixture the little bars, when exposed to damp atmosphere, evidently produced volcanic action; and to this we are disposed to attribute the rapid destructive action taking place when the two metals are chemically combined. These results indicated the necessity of diminishing the quantity of silver, and 1 of silver to 200 steel was tried. Here again were fibres and globules in abundance; with 1 to 300 the fibres diminished, but still were present; they were detected even when 1 to 400 was used. The successful experiment remains to be named. When 1 of silver to 500 steel were properly fused, a very perfect button was produced; no silver appeared on its surface; when forged, and dissected by an acid, no fibres were seen, although examined by a high magnifying power. The specimen forged remarkably wall. Although very hard, it had an every respect the most favourable appearance. By a delicate test every part of the bar gave silver. This alloy is decidedly superior to the very best steel, and this excellence is unquestionably owing to a combination with a minute quantity of silver. It has been repeatedly made and always with equal success.

best quality. This alloy is, perhaps, only inferior to that of steel and rhodium, and it may be produced at small expense; the value of silver, when the proportion is so small, is not worth naming; it will probably be applied to many important arts." The researches of these philosophers show that besides silver, gold, copper, platinum, rhodium, nickel, and even tin, may be made to form an alloy with steel. With respect to the chemical properties of alloys: alloys, generally speaking, behave in a manner similar to the pure inetals of which they are composed. Their composite nature, however, modifies in particular instances and in a very notable manner, the action of divers chemical segnits.

With respect to other important but little-known alloys, we find the following in Ure's Dictionary of Arta, Manufactures, and Mines:—"Iron and nickel unite in all proportions, producing soft and tenacions alloys. Some few years since, Mr. Nasmyth drew attention to the combination of silicon with steel. Fresh interest has been excited in this direction by the investigations of a French chemist, M. St. Claire Deville, who has examined many of the alloys of silicon. Silicon and iron combine to form an alloy which is a sort of fusible metal, in which carbon is replaced by silicon. The siliciurets are all of them quite homogeneous, and are not capable of being separated by lignation. Copper and silicon united in various proportions, according to the same chemist:—A very hard, brittle, and white alloy, containing 12 per cent. of silicon, is obtained by melting together 3 parts silico-fluoride of potassium, I part sodium, and I part of copper, at such a temperature that the fused mass remains covered with a very liquid secris. An alloy with 5 per cent. silicon has a beautiful bronze colour, and will probably receive important applications."—Ref. Encyclopédie Technologique.

### All-Saint's Day

The following tabular view of the composition of the principal alloys of copper is borrowed from Messrs. Oxland and Truran's "Metals and their Alloys."

	Copper.	Zinc.	Tin.
Antique bronze sword	87:000	•	13:000
Bronze for Statues	91.400	5.530	1.700
, for Medals	90-000	-	10.000
for Cannon	80.000		10.000
for Gilding	B2·257	17:481	0.238

,, Parisian	50.000	13.6	
German Silver	20.000	25 0	

ALL-SAINTS' DAY (in old English, All-Hallors, All-Hallors, all-Hallormas, or simply Hallormas), a festival of the Roman Catholic church, celebrated on the 1st of November, in commemoration of all the saints in general. The saints had become so numerous in the Church, that a day could not be set apart for each of them; in fact, there were not days chough in the year for that purpose; and hence, in 835, the 1st of November was appointed for all such as had not special days for themselves. The popular usages which in our own and other countries have come to be connected with this day, or rather the preceding eve or night, are evidently of pagan origin, and came afterwards to be sanctioned by the Church.

ALL-SOULS' Day, a festival of the Roman Catholic church, held on the 2nd of November, for the souls that are suffering in purgatory. It was first instituted at Clugny, by Odilo, abbot of that place, towards the end of the 10th ceftury, and soon came to be observed by the Church generally.

Allspice, and one of the Marie of the Marie of the Church generally.

Engenia Pimento, a plant of the Myrtle order. It is much used as a spice, and is thought to combine the flavours of cinnamon, cloves, and nutmegs; hence its common name. It is sometimes called Jamaica pepper, from the island in which it is chiefly cultivated, and sometimes pimento,

Allusion, ill-lu-shun (Lat. allusio, a playing or sporting with), in Rhet., a figure by which is denoted an arrest of the control of the cont something as applied to, or understood of another, on account of some similitude between them.

ALLUVION, dl-lw-vi-on (Lat. ad, to, and luo, I wash upon,—an accretion), in Law, is where land is gained from the sea by the washing up of sand and earth, so as in time to make terra firma.

ALLUVIUM, al-lu'-vi-um (Lat. alluere, to wash upon), in Geol., a name formerly given to those accumulations of sand, earth, and loose stones or gravel brought down by rivers, which, when spread out, form what are called alluvial plains and deltas. The term is seldom employed by modern geologists. (See FLUVIATILE DEPOSITS, DRITA.)

DEPOSITS, DELTA.)

ALLYLE, dP-lile, in Chem., a hypothetical organic radicle, having the composition  $C_0H_{11}$ , supposed to exist in the fetid oil obtained from garlic. This oil is called by chemists sulphide of allyle, its composition being  $C_0H_1S_1$ , or six equivalents of carbon, five of hydrogen, and one of sulphur. To the presence of this compound the odour of the whole chion family than Assafratida also contains this (see Allium) is due. Assafætida also contains this troug-smelling oil.

ALMACANTAR, or ALMUCANTAR, al-ma-can'-tar (Arab almocarhurat), in Astrom. a term formerly applied to all the small circles parallel to the horizon. Thus, any two stars having the same almacantars have the same altitude.

## Almoner

ALMAGANTAE'S STAFF, in Astron., an instrument formerly used at sea for observing the sun's amplitude at rising or setting, whereby to determine the variations of the compass, &c.

ALMAGEST, 20-ma-jest, the name of a celebrated book composed by Ptolemy, being a collection of a great number of the observations and problems of the annients relating to geometry, and servences. ancients, relating to geometry and astronomy, but especially the latter. It is the first work of this kind which has come down to us, and contains a catalogue of the fixed stars, with their places, besides numerous records and observations of eclipses and the motions of the planets.

ALMA MATER, al'-ma mai'-ter (Lat., a nourishing mother), a term applied to a university by those who have studied at it, to distinguish it from inferior schools of learning.

ALMANAC, all-mo-nik (Arab. al, the, and manak, to count), is an annual publication, giving the civil dirisions of the year, the movable and other feasts, the times of the various astronomical phenomena, and other useful or entertaining information. Almanacs existed among the Alexandrian Greeks in or after the existed among the Alexandrian creeks in or after the time of Ptolemenus. The time of their first appear-ance in Europe is not known. The first of any note was that by Purbach, 1450-61. The first printed almanac was that of Regiomontanus, which appeared from 1475 to 1506. In England the universities and the stationers' company possessed a menopoly of the trade in almanaes from the time of James I. to 1775, when a decision of the court of Common Pleas in favour of one Carnan, a bookseller, abolished it. The Nautical Almanae, published by the Admiralty, for the USG of astronomers and seamen is brought out trace. use of astronomers and seamen, is brought out two or three years in advance. The stamp duty, of fifteen three years in advance. The stamp duty, of fifteen pence per copy, to which almanacs were long subjected,

pence per copy, to which amandas were long surjections, was abolished in 1834. (See CALENDAR.)

ALMANDINE, di-man'-deen, in Min., a gem found in Greenland, Ceylon, and the Brazila. It is an iron garnet, and consists of silica 86'3, alumina 20'56, pretoxide of iron 33'2.

ALMAYNE RIVETS, all-main.—In the 17th century almayne rivets were introduced as a means of holding together the overlapping plates of armour worn accedefence to the person. The thigh-pieces of the defence to the person. The thigh-pieces of the mailed suit in which the Swiss soldier shown at p. 45 is attired, were secured together by these rivers, which, being constructed to move in slits, allowed of a which, being constructed to move in suts, allowed or we freer motion to armour than it formerly had. They were invented in Germany: whence the name, almayno being the medieval word for Germany.—Ref. Hewitt's Ancient Arms and Weapons in Europe; Skelton's II.

Lustrations of the Goodrich-Court Armoury.

ALME, or ALMA, al'-me, are a class of girls in Egypt. ALME, Or ALMA, at me, are a class or gure in Legyus, whose occupation it is to amuse company with singuing and deneing, and who, like the Italian improvisators, can occasionally pour forth their thoughts in unpremeditated verse. They are called Alme from having received a better education than other girls.

ALMOND, a'-mond, in Bot. (See ANTGDALUS.)
ALMONER (formerly called almatour), a'-mo-ser (Fr. aumoner, to pay a time for the poor), in the primitive sense of the word, denoted an officer in a religious house, to whom belonged the management and distribution of the alms of the house. By the ancient canons, all monasteries were to spend at least a tenth part of their income in alms to the poor. The almoner of St. Paul's was to dispose of the moneys left for charity according to the sppointment of the donors, to bury the poor who died in the neighbourhood, and as breed up eight boys in singing, for the use of the choir. By an ancient canon, all bishops are required to keep almoners.—The Almoner (le Grand Asmonier) of France was the highest ecclesiastical dignitary in that kingdom before the Revolution. To him belonged the superintendence of all hospitals and houses of lepers. The king received the sacrament from his hand, and he said mass at all grand solemnities. Almoner is also a fashionable title given by some writers house, to whom belonged the management and distri-bution of the alms of the house. By the anotenic moner is also a fashionable title given by some writers to chaplains. In this sense we meet with almoner of a ship, almoner of a regiment, &c.—Almoner, Lord, or Lord High Almoner of England, is an ecolosiastical officer, generally a bishop, who had formerly the forfeiture of all decidands (which are now abulished), sun the goods of felos-de-se, which he was to distribute

# Alms

amongst the poor, and his office was to give the king's alms every day. He also had the power of giving the first dish from the king's table to whatever poor person he pleased.—Ref. Rieta, lib. 2, cap. 22.

ALMS, ams (Sax. aims), denotes what is given out of charity to the poor.

ALMSAURE and Alexandra.

ALMSGOUS, an edifice, or collection of tenements, erected generally by a private individual, and endowed with a revenue, for the maintenance of a certain num-

ber of poor, aged, or disabled persons.

ALNAGE, al'-naj (Fr. aulnage), a measure, particularly the ell.—Ref. Cowell; Blount.

Athages, or AULIAGES, al-na-jer (Fr. alner), is properly a measure by the ell, and the word aune, in French, signifies an ell.—Alnager was also an officer of the king, who, by himself or his deputy, looked to the assise of all the cloth made of wool throughout the land, and to put a seal for that purpose ordained, and he was to be accountable to the king for every piece of to the Mas to be accommanded to the Arthur was so scaled in a fee or custom appertaining to it.—Ref. Cowell; Blount; Termes de la Ley.

ALNUS, ül-nus, in Bot., the Alder, a genus of plants belonging to the Birch order Betulaces. The species

d. glutinose is a well-known tree. Its timber resists the destructive action of water for a long time, and on this account is much used for the piles of bridges. Its bark is satringent, and has been employed in medicine and for tanning; it is also used as a dye-stuff, giving a red colour when slone, and black when added to a solu-tion of copperas. It is a low tree with a rugged bark, and grows in moist situations. The leaves are roundish, waved, serrated, and somewhat sticky, being downy The leaves are roundish, underneath about the veins. The flowers grow in long hanging catkins. The species A. incana is found in Kamtschatka, where its bark is used for making a kind

ALOA, äl-o'-ä, in Grecian Ant., certain festivals cele-brated at Athens in honour of Bacchus and Ceres, at the time of harvest, when the first-fruits of the earth were offered to the god or goddess. The term was derived from alos, a barn: whence Ceres came to be called Alous, that is, a filler of barns.

ALOE, &\*l'-o (Lat.), in Bot., a genus of monocotyle-donous plants belonging to the nat. ord. Liliacea, the

Lily tribe. There are several species, all natives of warm climates, but capable of being cultivated in colder regions as ornamental garden plants. The leaves are succulent, and edged with spines; they yield the juice which, when inspissated, constitutes the bitter drug called aloes (see this word). The flowers constitutes the are usually red, growing in a bunch at the top of the stem. Some of the larger kind of aloes are of great importance to the inhabitants of countries in which they grow. Beset as the leaves are with atrong spines, they form an impenetrable fence. The negroes of the western coast of Africa make ropes and weave nets from the fibrous parts of the aloe leaf. From the stems of one kind the Hottentot hollows out his quivers. The juice of aloes was formerly used in eastern countries in embalming, in preserving dead bodies from putrefaction; and as the resinous portion of this juice is not soluble in water, it is sometimes adopted in hot climates as a preservative to ships' bottoms against the attacks of marine insects. In the East-Indies, the juice of these plants is used as a varnish to preserve wood from the attacks of destructive insects; and skins, and even living animals, are often smeared with it for the same purpose. About fifty miles to the morth of the Cape of Good Hope there is a tract of

morth of the Cape of Good Hope there is a tract of mountains wholly covered with aloes. In the arts, a particularly beantiful violet colour is obtained from the leaves of the Socotrine aloe (A. Socotrina).

ALOE, THE GREAT AMERICAN.—According to Browne's "Natural History of Jamaica," the largest and most succellent leaves of the Socotrine aloe are placed upright in tubs to allow the juice to dribble out, (See AGAVE.)

ALOES, a drug used medicinally in small doses as a ALORS, a crug used medicinally in small closes as a toulo, and in larger doses as a purgative and an em-surangogue. It is the inspissated juice of the leaves of various species of Aloe. There are several com-mercial varieties imported, but the origin of some is not accurately determined. Barbadoes aloes is obtained from the species Alos vulgaris. Both soccotrine and hepatic aloes are probably prepared from A. soccotrina

# Alphabet

and A. purpurascens; for the difference between the two and a. purpurazeons; for the difference between the two kinds may be accounted for by a difference in the mode of treating the juice. Thus, when the juice from the species A. soccotring is inspissated by artificial heat, the product resembles soccotrine aloes; but when it is allowed to dry up without the aid of artificial heat, it resembles hepatic aloes. Cape aloes is chiefly ob-tained from A. spicate; Indian aloes from A. indica; but the varieties known as borse or calculing aloes; but the varieties known as horse or caballine aloes, Mocha aloes, and Curaçoa aloes, have not been traced to their respective sources.

to their respective sources.

ALORITO ACID, di-o-et'-ik, an acid formed by the action of nitric acid upon aloes, used in dycing.

ALOPT, d-loft', in Mar., signifies at the masthead, or in the tops or higher part of the rigging.

ALONGSEDE, d-long-side', in Mar., a term importing that a ship is parallel to another, or to a wharf.—Along-shore, navigating a vessel along the shore or coast.—Along-shore Owner is one who sends his vessel to see in ways of stores and novisions.

to sea in want of stores and provisions.

Alonsume or Alphonsune Tables, a-lon'-sin, an astronomical work which appeared in the year 1252, under the patronage of Alonso X., reputed by some to be constructed by Isaac Ben Suid, a Jew; by others, by Al Cabit and Aben Ragel, the preceptors of Alonso.—Ref. Delambre, Histoire de l'Astronomie du Moyen

ALOYSIA, or LIPPIA, a-loi'-si-a, in Bot., a gen. of plants belonging to the nat. ord. Verbenacea. Aloysia, or Lippia citriodora, is the sweet verbena or lemon-

plant of our gardens.

ALPACA, il.-pik-a, in Zool., a species of the gen. Lams, with which it is so closely allied, that by some it is set down as being only a variety of it. The alpaca inhabits the mountainous parts of Peru, and obtains its aliment from the coarse and scanty herbage growing on the sterile soil of those elevated regions. Its general form hears a close resemblance to that of the sheep, but its head and neck are more graceful. The upper part and sides of this animal's body are covered with light chestnut-brown wool, which hangs down in slightly light chestnut-brown wool, which hangs down in slightly curled meshes almost a foot in length. This wool is extremely soft and elastic, and is nearly as fine as that of the Cashmere goat. The face, up to the posterior margin of the jaws, has short smooth hair; but, from the forehead, a stiff silky hair falls over the eyes. The shearing of the wool takes place annually, from 10 to 12 lbs. of wool being obtained from a single animal.

Alpaca Wool being obtained from single animal.

Alpaca Wool.—This valuable product is obtained
from the alpaca, or paco, an animal half sheep half
gost, inhabiting the mountains of Peru. Great efforts
have been made to naturalize it in this country, in
Germany, and in Australia. In the latter country, the experiment has been attended with great success. The wool of the alpaca is long, lustrous, and silky. Its manufacture into textile fabrics was begun in 1843, at Braiford, in Yorkshire, and has since progressed at such a rate, that Mr. Titus Salt, of that town, has built one of the largest and most splendid factories in the world, which in itself constitutes a town called Saltaire, a compound of the name of its founder and that of the

river upon which it stands.

ALPHABER, all-fu-bet (from alpha and beta, the names of the two first letters of the Greek alphabet), is a term applied to the letters of which a language is composed, in their natural or accustomed order. In spite of the extreme diversity of languages, most alphabets present, in the number, order, and even form of their letters, decided evidences of a common origin. It has been disputed, whether to the Egyptians, Chal-deans, or Phœnicians, belongs the honour of having invented the written characters. The common opinion, however, is, that we are indebted for them to the Phænicians. Cadmus is said to have brought the Phomicians. Cadmus is said to have brought the Phomician alphabet, consisting of 15 letters, into Greece, about 1493 n.c. This was subsequently altered and added to, and became the ground of the Roman alphabet, which is now in use over Europe. The English language comprises 26 letters; French, 25; Italian, 20; Spanish, 27; German, 26; Russian, 41; Latin, Hebrew, Chaldee, Syriac, 22; Greek, 24; Arabic, 28; Persian, 32; Turkish, 33; and Sanskrit, 50. The Chinese have, properly speaking, no alphabet; but they have 214 radical or elementary characters.

ALFINIA, & l-pin'-1-a (from Prosper Alpin, a celebrated botanist), in Bot., a gen. of aromatic herbaceous plants, in the nat. ord. Zengiberacea, the Ginger tribe. The roots of the species A. galanga and A. chinense constitute respectively the Java and Chinese, or greater and lesser galangals. These foots have similar properties to ginger, and are used for the same purposes. The ovoid China cardamum, used in veterinary medicine, is the fruit of A. alba. The seeds of this plant are commonly employed as a condiment by this plant are commonly employed as a condiment by the Chinese.

ALSINER, dl-sin'-e-e, in Bot., the Chickweed sub-ord of Caryophyllacea. There are numerous genera; Alsine, Cerastium, Arenaria, and Stellaria, being exam-

(See CARYOPHYLLACER.)

AL SINAT, se-rat' (Arab., the path), according to the belief of some of the Mahometan sects, is the name of the bridge which spans Hades, and over which every one must pass in order to enter Paradise. It is said to be as narrow as the edge of a razor. Those who are unencumbered with the weight of sin may pass over it with the rapidity of a steed in full course; but those whose iniquities bear them down, will tumble from it into the infernal depths beneath.

ALSOBER, di-so'-de-e, in Bot., one of the two sub-orders into which the nat. ord. Violuoca has been divided. The species have regular flowers, with an-thers not furnished with appendages. (See VIOLACER,

VIOLEE.)

ALSTONIA, il-sto'-ne-a, in Bot., a gen. of dicotyle-donous plants, belonging to the nat. ord. Apocynacea, the Dog-hane tribe. The species A. scholaris has a bitter tonic astringent wood, and is a native of South America.

ALSTREMERIA, dl-stre-meer'-i-a, in Bot., a gen. of plants belonging to the Amaryllis ord., or Amaryllidacew. The species are all South American. Their leaves are twisted, so that what should be the upper surface becomes the lower; their roots are succulent, and rich in starch. The starch is extracted, and used as a kind of arrowroot by the inhabitants of the districts wherein these plants flourish.

ALT, alt (Lat. altus, high), in Mus., a term applied to that part of the scale which commences with F, the fifth line in the treble clef, and ends at E, the third

ledger line above the same clef. ALTAB, awl'-tar (Lat. altare), a place erected to offer

sacrifice upon. The first altar of which we have any notice was that erected by Noah when he quitted the ark. In the tabernacle, and afterwards in the Temple, two altars were erected, one for sacrifices the other for incense. The table for shewbread is also sometimes called an altar. Among Christians, the al-tar is a square or oblong table, or tablet, placed at the east end of the church, for the celebration of the mass in Roman Catholic, or of the sacrament in Protestant churches.

ALTAR-PIECE, is a painting in churches,

over the altar. They seem not to have been introduced until about the end of the 4th century.

ALTERATIVES, awl'-ter-d-tips (Lat. altero, I change), in Med., is a term employed to denote a class of remedies that have the power of gradually changing the state and condition of the functions, secretions, &c., sna condition of the functions, secretions, &c., of the human body. Alteratives are usually administered in frequent small doses; and in this way some of our most active and even poisonous drugs produce very beneficial effects.

ALTERNATE, owl-ter-nait, in Her., a term used in respect to the situation of the quarterings. Thus, the first and fourth quarters, and the second and third, being generally the same, are called alternate quarters.

ALTERNATION, out-ter-not'-shun, in Math., a term ap-plied to the changes of orders in any number, called also Permutation. It is found by a continual multiplication

of all the numbers; thus, to know how many changes can be rung on six bells, multiply the numbers 1, 2, 3, 4, 5, 6 continually into one another, and the last product is the answer.

ALTERNATION OF GENERATIONS. (See GENERA-

TIONS, Alternation of.)

ALTERN BASE, audi-tern, in Math., a term used in contradistinction to the true base. Thus, in oblique triangles, the true base is either the sum of the sides (the difference of the sides then forming the true base), or the true base is the difference; in which case

base), or the true base is the limit the sum in the altern base.

ALTHEA, di-the'-ā (Gr. altheo, I heal), the marshmallow, a gen. of plants belonging to the nat. ord. Markaceæ. The species A afficinalis, the common marshmallow or wymote, is an indigenous perennial, growing in salt marshes near the see, and on the banks of rivers. blossoming during August and September. Its flowers which are rather large and rose-coloured, are arranged, three or four together, on axillary stalks. The leaves are hoary, green, odourless, soft, and downy, having a mucilaginous taste. The whole plant abounds in mucilage, particularly the root, which is used in medicine. In France, marsh-mallow is a favourite demulator of the formulation of the formula cent. The famous patte de Guimauve is composed of the substances obtained from the root, with gum-arabic, sugar, and white of egg. Buchner states that the chief constituents of the marsh-mallow root are a fatty oil, starch, glutinous matter, uncrystallisable sugar, althein, and mucilage. Its chief principle, althein, is identical with asparagine. It is crystal-A. rosea, the lizable, odourless, and almost tasteless. hollyhock of our gardens, is another well-known species. It has similar properties to the common marsh-mailow, and its flowers are officinal in Greece. From the leaves, a blue colouring matter resembling indigo is extracted. Strong fibres suitable for cordage have been obtained from the stem.

ALTITUDE, & Atti-tude (Lat. altitudo, height), in Astron., is the height of a celestial body above the horizon. It is measured by the angle which a line from the eye to the star or planet makes with the horizontal tine eye to the star or planet makes with the horizontal line. An altitude may be true or apparent. If it be taken from the real horizon, the altitude is true; if from the apparent or sensible horizon, the altitude is that which appears to our observation, and the true is that from which the refraction is subtracted. The true altitudes of the heavenly bodies differ but little from their apparent altitudes, on account of their distance from the earth's centre, and the smallness of the mark's from the earth's centre, and the smallness of the earth's semi-diameter compared thereto. In observatories, altitudes are taken by means of telescopes attached to graduated circles, and at sea, by instruments called

sextants. (See Astronomy.)

ALTITUDE, in Geom., one of the dimensions of a body, being the same with what is commonly called height. The altitude of a figure is the distance of its body, boing the same wind what is commonly called, height. The altitude of a figure is the distance of its vertex from its base; in other words, it is the length of a perpendicular line let fall from the vertex to the base. The altitude of a cone is measured by a line perpendicular to the plane of the base, drawn between the vertexand base of the cone.

ALTO, all'-to, in Mus., a term applied to the highest male voice, the ordinary compass of which is from F, the fourth line in the bass, to C, the third space in the treble.

the treble.

ALTO CLEF. (See CLEF.)

ALTO RELIEVO. (See RELEVO.)

ALUDEL, äl'-u-del.—The sludels of the ancient chemists were pear-slaped glass vessels, open at both ends, which were joined together to form a series.

ALUM, äl'-um (Lat. alumen), a sait consisting of sulphate of alumins in combination with sulphate of protesh and ampropria phate of alumins in combination with sulphate of potash, soda, or ammonia. Potash and ammonia alum are used in dyeing, in calico-printing, in paper-making, in the manufacture of colours, and in medicine. Alum is obtained by submitting alumshale, which consists of alumina, from pyrites, and coaly matter, to the action of fire in enormous heaps for one or two years. During the combustion, the sulphur of the iron pyrites (sulphide of iron) combines with the oxygen and alumina, forming sulphate of alumina, which is dissolved out of the cooled mass by water. This solution is then converted.

# Alumina

into alum by the addition of either sulphate of potash or sulphate of ammonia, the latter being most generally used on account of its cheapness. The principal sources of alum-shale are at Hurlet and Campaie, near Glasgow, of alum-shale are at Hurlet and Campaie, near Glasgow, and at Whitby, in Torkshire. Alum is also manufactured in great quantities by Spence's process from various materials derived from coal and from the coal strata. Sulphurie seid is, in the first place, made from the iron pyrites with which the coal-measures abound. This when heated with coarted coal shale which coal This, when heated with roasted coal-shale, which con-tains alumina in large quantities, forms sulphate of alumina, with excess of sulphuric acid. The aumonialumina, with excess of sulphuric acid. The ammoniscal liquor of gas-works is boiled, and the vapour conducted through the hot solution of acid sulphate of alumina, the acid being neutralized by the formation of sulphate of ammonia. The ammonia alum crystallizes in large masses, and is purified by redissolving and recrystallizing. Ammonia alum is more valuable than potash alum, from containing 11-90 per cent. of alumins, which is the active ingredient, while potash alum contains but 10-82 per cent. About 20,000 tons of alum are now anually manufactured in the United of alum are now annually manufactured in the United Kingdom. Mr. Peter Spence, of Manchester, manufactures about one-third of this quantity. Soda alum is not used in the arts. The great use of alum in dyeing and printing is on account of the property posseesed by alumina of uniting with and precipitating cer-tain vegetable substances in an insoluble form. These, when made into pigments, form lake. (See DYKING, CALTCO-PRINTING, and LARES.) Muslin dipped in a solution of alum is rendered incombustible.

solution of alum is rendered incombustible.

Alumna, a-lu-mi-ma (Al<sub>2</sub>O<sub>3</sub>), the seaquicoide of the earth-metal aluminium, the principal constituent of clays. The hydrate is obtained in the form of a gelatinous precipitate, by sating ammonia, or carbonate of ammonia, to a solution of alum. By drying and igniting, it is changed into the anhydrous sesquioxide, insoluble in water, but soluble in acids and alkalies. Mr. Walter Crum has discovered a modification or allotropic condition of alumina produced by alkalies. Mr. Walter Crum has discovered a modifica-tion or allotropic condition of alumina, produced by igniting bi-acetate of alumina, which is soluble in water, and forms a translucent coagulum with dye-woods. By the addition of a small quantity of acid, alkali, or even neutral salt precipitation of alumina, in a third allotropic condition takes place; this form being insoluble in acids, but soluble in alkalies.

ALUMINA, ACETATE OF . The acetate of alumina is much used in the arts on account of the easiness with which it parts with its alumina. It is formed by adding acetate of lead to sulphate of alumina, and filtering off the insoluble sulphate of lead.

ALUMINA, SILICATE OF.—The chief ingredient in

ALUMINA, SILICATE OF.—The cuter ingredient in rommon clay.

ALUMINA, SULFHATE OF.—This salt is now used extensively in the arts, under the name of "aluminous cake," patent alum," and "concentrated alum." It is made by treating the calcined clays of Devonshire and Dorsetshire with sulphuric acid, precipitating the from, in the form of Prussian blue, by prussate of potash. This substance promises to supersede alum, being cheaper and containing a larger percentage of

alumins.

ALUMINIUM, čil-u-min'-i-um, in Chem., a metal, which has lately attracted much attention from its peculiar lightness. It was discovered by Wöhler in 1827. Its preparation has been very much simplified by the celebrated French chemist Doville, and it is now regularly prepared as a commercial product in the following manner:—Anhydrous alumina is mixed with charcoal and oil, and ignited in a covered crucible. When cold, the mass is broken to pieces, and exposed at a red, theat to the action of chloring ass. Chloride When cold, the mass is broken to pieces, and exposed at a red heat to the action of chlorine gas. Chloride of aluminium is formed, and, when cold, is mixed with half its weight of chloride of sodium and fluor spar. This mixture is placed in a crucible with one-eighth of metallic sodium, and hested to the melting-point of the misterials employed. The sodium seizes on the fallorine, leaving the aluminium in a reguliue state. Aluminium thus prepared is a bluish white metal, similar to silica. It becomes as hard as iron on being themselved and relied. Its extraordinary lightness. similar to suica. It decomes as nard as from on seing fammered and rolled. Its extraordinary lightness, \$5 (the specific gravity of glass) has already led to its employment in jewellery; and, as the manufacture be-becomes cheiger, many more uses will arise. It forms a hard gold-coloured alloy with copper, called slumi-

#### Amaranthaces

nium bronze, which promises to be useful. It consists of 90 per cent. of copper and 10 per cent. of aluminium. It consists Its other alloys are very promising, and are under investigation. Added to iron in the proportion of 25 per cent. it prevents the oxidation of that metal by per cent...it prevents the oxidation of that metal by moist air. Its price has decreased from £3 to 5s. per ounce during the last few years; and, being four times as light as silver, it only costs one quarter the price of that metal, weight for weight.

ALUMINIUM BRONZE. (See BRONZE ALUMINUM.)

ALUMINUM, a name given to the root of the Geranium maculatum, which contains much tannin. It is used in North America as an astringent.

ALUMS, in Chem .- Common alum is the type of a series of double salts, consisting of an ulkaline sulphate in combination with the sulphate of a metallicesesqui-oxide, but which do not necessarily contain alumina. The principal alums are :—
Sulphate of potash and alumina.

ammonia Bods potash and iron. manganese. 13

The alums crystallize in cubes or octahedree, and contain 24 equivalents of water of crystallization.

ALUMSTONE, or ALUNITE.—A mineral found near Civita Vecchia, in Choorin, at Pic-do-Landy, in France, and in the Grecian archipelago. It consists of alumina 37:13, suphurio acid 35:53, potash 11:34, and water 13. It is one of the principal sources of alum.

ALUEDIA, il-ve'-o-lu (Lat. alucolus, a small hollow vessel), in Bot., a term applied to any little pit or socket, but particularly to a cavity in the receptacle where the seed is placed.

where the seed is placed.

ALXXIA, it lix -i.a, in Bot., a gen. of dicotyledonous plants, belonging to the Dog-bane ord. Apocynacea.
The species A. stellata has an aromatic bark, resem-

bling in properties that of canella.

Ding in properties that of canella.

AMADOT, ām'-a-doo (Lat. all manum dulce, soft to the touch), a spongy substance, generally known as German tinder, which can be ignited by a spark from a fiint-and-steel. It is prepared by soaking thin slices of the funci Polyporus igniarius and fomentarius in a solution of intrate of potash (saltpetre), after they have been softened by beating with a mallet. Similar slices not treated with the salt are sometimes used in four to reflected parts and also to

slices not treated with the sait are sometimes used in Surg. to give support to affected parts, and also to restrain hemorrhage. Wher impregnated with gunpowder, the prepared fungus forms black amadou. Slices of the species Polyporus squamous and betulinus are pressed, rubbed with pumice, and formed into razor-strops. (See Polyporus squamous and betulinus Analosan, a mall-gam (Gr. malagma, that which it will combine, forms a pasty orfluid mass called an amalgam, and is, in fact, an alloy of mercury. (See Alloy, Gilding, Gold). The property which mercury possesses of dissolving gold is taken advantage of, in the various processes for extracting this metal from its powdered ore. The mercury is afterwards distilled off, leaving the gold in a pure form. Amalgam for electrical machines is made by adding tinfoil in small pieces to mercury, until they form a paste.

Amanta, ama-ni-ta, in Bot., a gen. of fungi.

AMANITA, ām-u-ni'-ta, in Bot., a gen. of fungi, thus named from Mount Amanus, in Cilicia, where thus manded from Module. The species have a close resemblance to some edible fungi, and are not unlike the common English mushroom. Amanita mescaria is a very poisonous kind, though the nativos of Kamtschatka are in the habit of eating it for the sake of its naturation of the sake. Kemtschatka are in the habit of eating it for the sake of its narcotic effects. It grows very abundantly in some parts of Kamtschatka, and is collected and dried by the natives. When steeped in the expressed juice of the whortleberry, it imparts to the liquid the intoxicating properties of strong wine, and when awallowed alone, it speedily produces drankenness. One or two small fungi are a common dose to cause a pleasant intoxication for a whole day. In too large doses it induces violent spasms.—Ref. Johnston's Chemistry of Common Life. Common Life.

AMARANTHACE & Sm-a-rau-thou-so-e, in Bot., the Amaranth ord. of dicotyledonous plants. There are 46 genera and 486 species, herbs or shrubs, nearly all natives of tropical regions.

#### American

A HARABHUS, "Send-rim" these, in Bot., the typical gen. of the net. ord. Americal access. Some of the species have bright-coloured persistent flewers, and have been introduced into this country as ornaments; garden plants. The best-known are A condition (Lovalies bleeding) and A. hypochondriums (Primes's

AMARYLIMACES, des.d-ril-li-dal-se-s, in Bot., the Amarylim ord, of monocotyledohous plants. There are 68 genera and 460 species, natives of many parts of the world, but most abundant at the Cape of Good Hope. Several of these plants have poisonous properties, and some yield excellent fibres.

AMARYLIES. dm-d-rill-lies in Bot.

perties, and some yield excellent fibres.

ANAUYLLIS, &m-d-ril'-lis, in Bot., the typical gen.
of the nat ord. Amaryllidacea. Several beautiful
garden and greenhouse plants are included in this
genuss? They are remarkable for their brilliant and
symmetrical flowers, which exhals a sweet perfume.

AMAUROSIS, &m-an-ro-is (Gr. amauros, obscure), in
Bath., is a blindness or obscurity of vision, proceeding
from a diseased state of the optic nerve, or of that
part of the brain in connection with it. It generally
somes on organization, with diumess or confusion of

part of the brain in connection with it. It generally comes on gradually, with dimness or confusion of sight, variations of colour, or the presence of floating objects called spectra. It is commonly occasioned by long-continued over-excitement of the organs of vision or by sudden exposure to a bright light, or it may proceed from a disordered state of the stomach. It is proceed from a disordered state of the stomach. It is also sometimes hereditary. It may be permanent, or only temporary. In a full habit, it is to be treated by depletion; in the weak, by tonics and alterstives. Counter-irritants are also to be used; as, blisters behind the ears, or a seton in the back of the neck, or on the temples.

AMAZON, ām'-ā-zon (Gr. a, without; mazos, the breast), a fabulous female warrior, famous for valour, and said to be an inhabitant of the Caucasus; so called from their cutting off the right breast to give greater freedom in the use of the bow. The ancients mention three nations of female warriors. The Asiatic Amazons, the Scythian Amazons, and the African Amazons, which last were annihilated by Hercules.

Ambassadon, dm-bis'-si-dor (Fr. ambassadeur), in Diplom, signifies an agent sont by one sovereign power to another to treat on affairs of state and matters affect ing the interests of his country. Ambassadors are of wwo kinds; those that reside regularly at the court to which they are accredited, and those that are sent there on a apecial occasion, the latter being styled "ambassa-dors extraordinary." The duties of an ambassador are to watch over the interests of his own country at the foreign court; to negotiate for treaties and alliances; to enforce the performance of existing treaties, to protect his countrymen from injury orunjustice, and to aid them in case of need. Ambassadors, together with their families and suites, enjoy perfect security of person, and their property is protected against all legal process. They are usually, also, exempted from custom duties and from all taxes, and are allowed the

free exercise of their religion.

AMBER, am'.ber (Fr. ambre, Sp. ambar, Gr. elektron), a resinous mineral solid, of a fine yellow colour, which, on being rubbed, becomes strongly electric. It has given its name to the science of electricity, being the first substance which was found to possess being the first substance which was found to possess such properties. It is much used for jewellery and pipe mouthpieces. Dissolved in chloroform, it forms one of the best photographic varnishes. It is found abundantly or the shores of the Baltic, and, occasionally, in Greenland, England, Italy, Spain, Sicily, Siberia, and Chins. It is supposed to be a fousil gum or resin, from its constituents and properties, and from containing the bodies of insects inclosed in its mass.

AMBRE, ACID OF. (See SUCCINIC ACID.)
AMBRECRIS, dm'-bor-gris (Fr. ambre, ambre; gris grey).-Ambergris is a morbid secretion of the spern whale, much used in persumery, found fleating on the sea, or deposited on the coast. Although possessed of little scent, it imparts a delicate occur to other perfumes.

AMBORIA, dm-bro'-she-d (Gr. a, not, and brotos, marrial), in Heathen Myth., was the name given to the food of the gods, as distinguished from nectar, which was their drink. It was supposed to endow them with eternal youth and immartality; and mortals who

## Americanisma

were permitted to partake of it were in some measure assimilated to the gods, receiving an increase of strength and beauty. Ambrosis was also the name of nettein festivals, observed in Greece in honour of Bacchus,

during the vintage.

ARBEY, Zm. bye (Lat. armarium, a storehouse, looker, aupboard), the piace where the arms, piste, vessels, and everything which belonged to housekeeping.

were kept.

AMBULANCE, am'-bu-lans (Lat. ambulo, I walk), a term derived from the French, and applied to those moving hospitals which accompany every army, or division of an army, in the field, furnished with all the requisites for the succour of the sick or wounded. It is also applied to the waggons or carts provided for conveying the wounded from the field of battle. The latter are termed by the French ambulances volantes, and were first introduced in 1793, by Larrey, the celebrated French military surgeon. During the Crimean war, ambulances mounted on the pack-saddles of mules were used, and improved ambulance-carts were con-

structed and sent out to the Crimes.

AMBUSCADE, dem'-bus-kaid, in Mil., a term derived from the Italian imboscare, to lie in bushes or concealed. and signifying the lying in wait or in concealment of a body of troops to attack an enemy unawares.

AMBLANCHIER, am-e-lan' she-er, in Bot, a gen. of plants belonging to the sub-ord. Sanguisorbea, of the nat. ord. Rosacea. The species A. canadensis is a native of the arctic regions, and its fruit, called the shad-berry, or service-berry, is used for mixing with pemican.

AMEN, ai'-men', a word derived from the Hebrew, and signifying properly, firm of faithful. In the beginning of a sentence, it is used by way of emphasis, as, verify, or truly; and at the end, especially of prayers or hymns, it signifies so be it, or so let it be.

AMENDE HONORABLE, a-mand' hon-o-rab! (Fr.), a kind of punishment inflicted in France upon traitors, particides, or sacrilegious persons. It was thus inflicted: the offender being delivered into the hands of the hangman, he was stripped of his shirt, and a rope put about his neck, and a taper in his hand; he was then led into court, where he was obliged to beg pardon of God, the king, the court, and his country. Sometimes the punishment ended here; but sometimes it was only a prelude to death or banishment to the cellars. ment to the galleys.

AMENDMENT, d-mend!-ment (Lat. emendatio, an emendation, or strengthening), in Law, is the correction of an error in the process, which may be amended, even after judgment. Such correction cannot be made after judgment. Such correction cannot be made where the error lies in giving the judgment itself. In such case, it is not amendable, but the judgment may be reversed or corrected by a majority of the judges of a court of error, composed of the judges of the different courts, or such of them as can attend, upon a writ of error sued out by the party aggrieved by the judgment.

AMENDMENT, in Pol. (See BILL IN PARLIAMENT.) AMENTACEOUS, d-men-tui'-se-us, in Bot., a term applied to those plants which bear catkins (see AMEN-

applied to those plants which near cashing the Analytical Tun), as the oak, willow, poplar, hirch, and walnut.

AMENTUM, or CATKIN, a-men'-tun, in Bot., a kind of spike, which only bears barren flowers, that is, only stamens or pistils; these being separated from each other by bracts. The whole amentum usually falls off in one piece, soon after flowering or fruiting. The species of willow called palm in England has very fine catkins, and the young branches bearing them were formerly used to deck churches on Palm Sunday.

AMERCIAMENT, deservainment (lat. americamen-tum), in Law, signifies the pecuniary pfinishment of an offender against the queen, or lord of a franchise, in her or his court, that is found to be in miscricordia, i.e., to have offended, and to stand at the mercy of the ones on the deservation of the court of the queen or lord. It was the usual punishment inflicted by the court leet for public nuisances committed within its jurisdiction; but as these courts are seldom held, and their powers have fallen into desuetude, in consequence of the ready justice afforded by courts of law, unerciaments may be now considered as obsolete.

AXENICANISMS, d.mer.-i.co.-nime, words or phrases used in the United States of America, but not current in

## Amethyat

ral writings, the works of standard American authors containing very few of them. The number of new words introduced in America is comparatively small. The Americanisms are chiefly words or phrases used in a different sense from that which they have in England;

different sense from that which they have in England; as, I guess or recken, for I think or suppose. In some instances, words that have become obsolete, or whose meanings have changed in England, are preserved in America, and fall moder this class.

AMERICAL, \*aw'-e-thiet\* (Lat. \*amethystus), a var. of crystallized quarts, having a violet tint, due to a small quantity of manganese. The most beautiful specimens are obtained from Ceylon, India, and Persia. It is also found near Cork, in Saxony, and in Transylvania. The Oriental amethyst is a purple variety of the sapphire, and consists of alumina, with a small portion of oxide of iron.

of iron.

Amı. (See AMY.)

AMILANCE, OF AMECABLE, NUMBERS, ām'-i-ka-bel, in Arith., are those which are mutually equal to the sum of each other's aliquot parts. Thus, 220 and 284 are amicable numbers: the aliquot parts of 220 are, 1, 2, 4, 5, 16, 11, 20, 22, 44, 55, 110, which are equal to 284; and those of 284 are 1, 2, 4, 71, 142 = 220.

AMILANEUS, ām-i-ām'-thus, a fine variety of asbestos.

(See ASBESTOS.)

ARICUS CURIR, a-mi'-kusku'-ri-s.—It not unfrequently appens that a counsel, not retained in a cause before court, mentions some case within his knowledge which has been decided, bearing on the point under discussion, or makes a suggestion in aid of the argu-ment. He is then styled amicus curies, or friend of the

AMIDES, am'-ides. — The amides are compounds formed from ammonia by the substitution of one or more equivalents of a metalloid, a halogen, or an acid base, for one or more equivalents of the

hydrogen.

 $N \begin{cases} C_a H_a O_a \text{ (acetyl)} \\ H \\ H \end{cases}$ Ammonia, Trichloramide, Diniodamide, и{Н N Cl (H lãi H

AMMON, or AMUN, am'-mon, in Heathen Myth., was
the name of a celebrated deity of the Egyptiaus, who the name of a constraint and the help and, which was considered by the Greeks to be synonymous with their Jupiter. His chief city was Thebes, which was thence called the city of Ammon (No-Ammon, in the Old Testament), and by the Greeks Diospolis, or city of Jupiter. In the temples of the holy city he is represented as sitting upon a throne, holding the symbols of life and power, and wearing a crown with a peculiar ornament of two feathers and a long band behind, falling down to his feet. He is also sometimes represented with a ram's head, or with the head of a ram and the

with a ram's head, or with the head of a ram and the body of a sphinx.

ARMONIA, VOLATILE ALKALI, ARTMAL ALKALI, or STIELTS OF HARTHORN, dm-mo'-ni-a. — Ammonia is a gaseous compound, possessing the properties of the alkalies proper,—potash and soda. It was frat isolated by Priestley, in the year 1774, who named it alkaline air. He procured it from sal-ammoniae; whence its name. By submitting it to heat, he found it to consist of three parts of hydrogen to one of nitrogen. It is difficult to form it by the direct union of those masses that wherever asseems hydrogen and sitrogen gases; but wherever asseemt hydrogen and sitrogen are eliminated by any chemical action, a portion of ammonia is always found in the resulting compound.

## Ammonia Acua

During the decomposition of water containing air by

During the decomposition of water containing air by the electric current, a small quantity of ammonia is formed; also when a mass of moistened iron filings is exposed to the sir; but it is formed in the greatest quantities when introgenous organic matter patrelles, or is submitted to destructive distillation. Ammonia is also formed during the distillation of coal in gas-works, the ammoniagal liquor produced in this way being the great source of ammonia for commercial purposes. Formerly it was made from the ammoniacal liquor produced in the manufacture of bone-black. It is generally prepared in the laboratory by the action of caustic lime on some salt of ammonia.

NH\_O+CaO = CaCl+HO+NH\_3.

The gas evolved is collected over instrucy, or else by displacement, as it is gradually absorbed by yater. Ammonia is easily liquefied by the combined action of a pressure of 63 atmospheres and a temperature of 32°. By submitting this liquid to the action of solid carbonic acid, solid ammonia is produced. Ammonia is one not support either combustion or life, and inflames with difficulty. It is decomposed into its elements by passing through it a series of electric sparks, or by transmitting a current of it through a red-hot tube. Ammonia is readily absorbed by water, which takes up 670 times its own volume of the gas, forming the liquor ammonias of the chemist, or liquid ammonia, as it is generally improperly called. Ammonia is found in very small quantities in the sir, being evolved during the decomposition of most animal substances, more especially improperly called. Ammonia is found in very small quantities in the sir, being evolved during the decomposition of most animal substances, more especially excrements and urine. Ammonia forms an infinite number of salts with the different soids, most of the similar in their properties to the corresponding salts of potash and soda. AMMONIA, ACRIATE OF, or SPIRIT OF MINDEREUS, used in medicine as a refrigerant and disphoratio.

AMMONIA, CARBONATE OF .- The sesqui-carbonate of ammonis forms the smelling-salts of the chemist's shop, generally called Preston salts. Solution of carbonate of ammonia is sometimes used as an emetic. It is also used in the manufacture of unfermented bread. It is used in medicine as a stimulant.

AMMONIA, NITRATE OF.—This salt is used in the laboratory for the production of nitrous oxide, or laughing-gas. The crystals are melted in a retort, at a laughing gas. The crystals are melted in a retort, at a gentle heat, nitrous oxide being given off, and water remaining behind.

 $NH_{\bullet}ONO_{\bullet} = 2NO + 4HO.$ 

AMMONIA, SULPHATE OF .- This salt, which is much used as a cereal manure, is obtained in great quantities by neutralizing bone- or gas-liquor with sulphuric acid, evaporating and crystallizing.

Amountac, Gun.—This substance, which is often confused with the salts of ammonia, is a concrete juice,

procured from at unknown tree growing in Persis and Abyssinia. It occurs in agglutinated masses called Abyssinia. It occurs in agglutinated masses called tears, and is used in medicine as a stimulant and expectorant. When softened with vinegar, it forms a plaster, which has been used for the last 2,000 years, and has apprived all changes in medicine. and has survived all changes in medicine.

Ammoniac, Sal. (See Ammonium, Chloride or.)
Ammoniacum, dm'-mo-ni-a-kum, a fetid gum-resin
used in Med. It exudes from the stem of an umbelliferous plant known to botanists as Dorema ammonia-cum, which grows in Persis and the adjacent parts of Asia. It is occasionally prescribed as an expectorant, and is applied externally to promote the absorption of tumours and chronic swellings of the joints.

AMMONIE AQUA, AMMONIA (LIQUID), AMMONIE (LIQUOE), AMMONIA (SOLUTION OF).—The solution of gaseous ammonia in water is called by all the above gaseous ammonis in water is called by all the above names. As stated under Ammonia, water absorbe 670 times its volume of ammoniacal gas, forming a colourless transparent liquid, having a characteristic pungent smell, a burning caustic taste, and a strong alkaline reaction. At its greatest strength its specific gravity is '850, and it can only be kept in closely-stoppered bottles. It is made by passing the gast through distilled water kept near freezing-point by means of ice. It is of great use in the laboratory as a re-agent, dissolving many oxides and salts insoluble in water. It is employed in medicina as a stimulant. There are two degrees of strength used,—the liquor ammoniss fortior, of '850; and the ordinary liquor ammoniss, or spirits of hartshorn, of '960. Mixed with

56

# Aumonia

oil, with which it forms a soon, it is used as a sub-facient, under the hams of easy-liminest.

Authority, Section offs, in Concht, a gen, of fossil shells allied to the Hilloy year. Familian: In chapte they resemble it read a lock, — element later same, from their supposed fileness to the horse apon the status of Jupiter America. Having, also, very much the sp-pearance of a delied analys, they are religious cormed petrified analys. They are found plentifully in the

colite formations, and are so abundant in some parts of Burgundy, that the roads are paved with them. The animal that inhabited this shell was provided with airsees, by means of which it could rise or sink in the water; and its shelly covering, necessarily delicate in order to float, was made strong enough to bear the pressure of great depths by its tubular form and inernal ribs or supports.

Aumonium.—The existence of a hypothetic com-pound metal called aumonium, and having the consti-tution NH, has been assumed as the only method of explaining the perfect analogy that exists between the saits of ammonis and those of the various metals. An equivalent of ammonia united to an equivalent of water is supposed to form the oxide of this metal, NH, + HO is supposed to form the order of the inets, Ma-Tho (NH<sub>2</sub>)O, corresponding to potassa, the oxide of potassium KO. The following comparison between the compounds of ammonis and those of other metals will show the working of this theory at a glance.

KMetak	(NH.)Metal.
NaOOride.	(NH.)OOxide.
AgCiChloride.	(NH.)ClChloride.
LilIodide,	(NH.)O.NONitrate. (NH.)O.SOSulphate.
CaO, NO,Nitrate.	(NH.)O, NONitrate.
BaO, SO, Sulphate.	(NH <sub>4</sub> )O, SO <sub>4</sub> Sulphate.

Hato, NO<sub>8</sub>...Suiphate. '(NH<sub>4</sub>)O<sub>5</sub>SO<sub>8</sub>...Suiphate. The theory of the existence of a compound metal is borne out not only by analogy, but by actual experiment. If a few globules of mercury are immersed in a solution of calcinde of potentium, and an electric current be passed through them, the mercury gradually swells up into a pasty mass, which experiment has proved to be an amagem of mercury and potassium. If chloride of ammonium be substituted, the same effect takes place, the only difference being, that the bulk of the intercury is much more increased, and at last floats on the solution, from its lightness. The formation of this simalgam seems not only to demonstrate the existence of ammonium, but also to show that it is metal, non-metallic amalgams being unknown. When thrown into water, these simalgams form solutions of potash and ammonia respectively, with the evolution of hydrogen. of hydrogen.

ARYOSTUE, CRICKINS OF.—This salt is ordinarily called salt-ampointed, or muriate of ammonia. It is made extensively by neutralising bone-liquor or gasliquor with hydrochlorio soud, symporating, crystalizing, and subliming. It was formerly manufactured by subliming the soot produced by a mixture of coal, salt, animal matter, and clay. It was first made from the soot produced by burning camely daing in Libya, near the temple of Jupiter Ammon, whence its chime. It is much used in the arts, more especially in timing iron, copper, and bress. It may be formed directly by the union of dry ammonia and chlorine.

# Amphibia

Acceptable, Ionne ov, du-no ni-ne. This salt is much used in photography for iodising collodies, on account of its great solubility in alcohol. Its manu-actomes way difficult; it should, therefore, be bought of a respectable chemist.

fecture is very difficult; it should, therefore, he bought of a respectable chemist.

America, or America, in allowifery, is the membranous bag in which the featus is inclosed in the womb, and which also contains the liquor americ. It is composed of three membranes; an outer, or flamentous one, called decides; a middle, named the chorion; and an inner, called the america.

Amonum, Amorama, in Both, a gen, or plants belonging to the nat. ord. Zimpibersees, the Ginger family. Several species have arountic seeds, which are used medicinally and as pieces in many parts of the world. A melegueis is a native of Western Africa, and yields the so-called grains of Paradise, or Guinea pepper, used in this country in vaterinary medicine, and yields the so-called grains of Paradles, or Guines pepper, used in this country in veterinary medicine, and for giving pungoncy to beer, wine, spirits, and tinegar. Most of the fruits called cardamoms, so largely employed in medicine as stimulants, are produced by plants included in this genne; thus, d. cordamoma yields the round cardamoms; d. maximum, both the large and small round China cardamoms.

A MORGING in Ret the heatened indice a

both the large and small round China cardamons.

AMORPUA, & mor'fo, in Bot., the bastard indigo, a
gen, of plants belonging to the nat. ord. Leguminoceae.
The typical species, & fraticose, is a native of South
Carolina, and is cultivated in English gardens. Its
flower is purple or violet, and very irregular, the corolla
wanting both wings and keel; its leafis very dark green.
The root, when peeled, is sometimes chewedas a remedy
for toothache. A blue dye-stuff resembling indigo, but
much inferior, may be obtained from this plant: hence
the common name for the genus.

AMORPHOUS, &-mon'fus (Gr. 6, without, morphe.

Amonrhous, d-mort-graus, without, morphe, form), in Chem., substances are said to be amorphous when they do not assume any crystalline form.
Amonrhanton, d-mort-indi-shue (Lat. amorthanto), in Law, an alienation of lands or tenements in mortmain,

vis., to say corporation or faternity and their successors. (See MORTHAIN.)

AMPELINE E., despectivedee (Gr. ampelos, vine), in Bot., a name given by some botanists to the Vine ord. (See VITACES.)

AMPRIORES, 82-pc-lop'-sie, in Bot., a gen. of plants belonging to the nat. ord. Vitaoes, the Vine fam. The species constitute the climbing shrubs called Virginian crespers. They are remarkable for the crimson tints assumed by their foliage in autumn, and for their ourlously formed tendrils.

ARTRIBIA, Institute (Gr. creph), both, and bios, life), in Zool., an ord. of the class of Reptiles. In ordinary language, the large lifely, in Zoul., an ord. of the class of Reptiles. In ordinary language, the term amphibious has been applied:—to animals such as frog, which at one period of their existence are squatio, breathing by means of sills, and which at another period of their life respire air, and are frequently on land; to animals such as seals, which, sithough breathing by means of lung, are yet capable of remaining under water for some time; to various terrestrial salmals, we have the hippopotamus, which frequent an aquatic medium. But if the term amphibious be taken in its literal sense, viz. as denoting the power of living both on land or in the water indifferently, it will be found to apply to only four genera of batrachism reptiles, which, according to Curier, are the only known truly simplificious arimass, imamuch as they aline possess simultaneously, both lungs and gills. These salmals are the Axolodia, the Menobranchi, and

the Sircus, inhabiting the American raves and the Protects, whose ballets is the streams which connect some these in O Hungary. In the system of Lineary Hungary. In the cretical of Linuxus the amphibias comprehended the whole of the ampair now inverse as reptiles; such as accepting, frogs, sortaines, and linesh, and even the cambiagnous subsets but according to the mest philosophical of the factor saturation, the term amphibia has been rectified to that order of reptiles called Battachians; for this resson, that these animals breathe by means of gills in their satisfact or taspots condition, and afferwards soquire lungs, and respire sir on assuming their perfect form as reptiles.—Ref. Todd's Cycloposided American and Physiology; English Cycloposides, "Natural History." (See Battackians, Taos, Sieres, Batamarius, Paperus.)

Ampariants, des Houge de toute silicate of alumina and magnatis, often coloured black or green by the substitution of exide of iron for the latter.

Ampariantour, des Jude of iron for the latter.

and magnesia, often coloured black or green by the substitution of a ride of iron for the latter.

Anxingtiour, he file eve-o-je (Gr. amphibolia, doubt, and logos, discourse), is a term used to denote withress managerithe if two different interpretations, arising wither from the order of the phrase, or from the ambignous meaning of a word. The answers of the mabignous meaning of a word. The answers of the oracles were trequently of this nature, as in that received by Pyrikus from the oracle,—Aio te Hacida Romanes miscore passe, where the meaning may be office that you will conquer the Romans, or that the Romans will conquer you.

Americana, in the broke (Gr. capid, both, about, n both sides, and braches, short), in Peetry, the name of a fact of three syllables, of which the middle one is long, and the first and last short.

Americana, in the first and last short.

Americana, in the first and last short.

Americana, in the first and last short.

In the short of three syllables, of which the middle one is long, and the first of the great group is the possession of a stem increasing only at the circumference. The sanklibrya of Endlicher therefore correspond with the Mencotyletlones of Justice, and with the three divisions Enlargens, and Dictyopens, of Laster.

Agreements Courses, En file 4 on it, a politico-religious court of ancient Greece, said to have been founded by and to have taken its name from, Amphic-tyon, son of Deucalion; but, according to Strabo, it was instituted by Acrisius, king of Arges. It was pro-bably at first a religious assembly, but it subsequently pany at first a religious assembly, but it subsequently asseme to be of great political importance. It was composed of two representatives from each of twelve Greek states, who met twice a year for the purpose of protecting their common interests, and preserving their religious institutions. As individual states became powerful, and strove for the first rank, the influence of this council decined, and in the time of Demosthenes it had essed to primare of wearast.

A 34

the magnificent building that in the works of the funtorial different. Therefore admires, and will long admire, the await preasting of the amulitheatre of Titue, which so well deserved the epithes of Colossal. It was a neithing of an elliptic figure. But has in length and set in breachin, founded on four-corrections, and rising, with four successive orders of architecture, to the suggest of 146 (187) feet. The orderies of the cities was encrusted with marble, and decorated with cities. The slopes of the wast edocumentated blumes abstingle were filled and surrounded withheatr or sighty rows of seats, of marble likewise, novered with cuspium, and opable of receiving with east four-correct when any operature. Sixty-four vessioness (for by that name the doors were very apity distinguished) yourselforthe immense multitude; and the entrance, passages, and staircases were contrived with suck arquisite skill, that each person, whether of the senatural, spacetrian, or plebeian order, arrived at his destined place without treathle or confusion. Nothing was sunsess which many respect could be subservient to the convenience and pleasure of the spectators. They were protected from the sun and rain by an ample emory, consciously drawn over their heads. The air was notificable refreshed by the playing of fountains, and protucely impregnated by the grateful seem of secondaries, the the centre of the earth like the garden of the Resperiets, and with the finest sand, and successivity assumed the most different forms. At one moment it accurate to rise out of the earth like the garden of the Resperiets, and was afterwards broken into the rocks and caverns of thrace. The substructure price and excessed to rise out of the earth like the garden of the fleeperiets, and was afterwards broken into the stocks and caverns of thrace. The substructure with armed weakle and supplies and veploushed with the monature of the deep. In the decoration of these scenes the Roman superced and published with the monature of the amperied and very of th displayed their wealth and liberality; and we read on various occasions that the whole furniture of the amvarious occasions that the whole furniture of the amphitheatre consisted either of silver, or of gold, or of amber. The post who describes the games of Darians in the character of a shepherd, attracted to the capital by the fame of their magnificence, affirms that the nets designed as a defence against the wild beasts were of gold wire; that the portions were gilded, and that the belt, or circle which divided the several ranks of spectators from each offer, was studded with a precious mosaic of beautiful stemes." As it is impossible by a more weak description to convey as active. powerful, and strove for the first rank, the influence of this council declined, and in the time of Demonthenes is had onesed to command respect.

Aspective arms, in the stricel imaginage, deputes that part of a theatre which rises above the top tier of boxes. It is also the name of an opartiment appropriated to public loctures and discourses, affect with sease rising one above another, either in a semisimple form or encompassing the whole room like the sease of an ancient amphitheatre.

SECTIONAL YERW OF AMPRICEMATER.

staircase B, while the other classes made use of the staircase C, which gave access to the floor of the internaciate landing or corridor, E, and then either ascended by the staircase F to the second division of benches, or by the staircase D to the second exterior corridor, and thence by the staircase G to the third division of benches, and higher still by other staircases in a different direction, to the third exterior corridor, which communicated with the uppermost division of benches. These different staircases were respectively opposite to different staircases are propositely opposited. The lower story stories of open accedes and an attic. The lower story is very lotter, with tall and narrow arches, separated by buttresses of two projections in the Gothie atyle, crowned by a Tuestan capital. A regular carisbisture encircles the insiding, and breaks in projection over every buttress. The exterior circuit consists of sitty open arches, of which four, at the extremities of the diameters, are ornamented with rediments: these were formerly the grand entrances. The vicestindes of this delibrated edilibe are so inuacrons that it is wonderful it should remain to well preserved as we find it at the present day. In 473 the Vingothe converted it into a fortress. In 730 it was taken by the

ANTHORA, dm'-fo-rd (Gr. amphoreus, from amphi,

on both sides, and paers, I carry), in Astiq., is the name of a vessel commonly of satheswere, so called bearing, so called

# Amplexicaul

from having a handle or ear on each side of the neck. Its form and size varied, but it was usually long and narrow, frequently about 2 or 24 feet in height, by about 6 inches in diameter, terminating at the lower extremity almost in a point, to admit of insertion into a stand or the sarth, in order to keep it apright. They were generally used for preserving oil, wine, honey, grapes, or other fruits; but also as sinerary urns. Homer mentions emphores both of gold and stone, and in later times glass amphores were not uncommon. Earther, amphores of the Roman period have occasionally been found in England. The amphora was also a measure of capacity among the Greeks and Romans. The Roman amphora contained 48 sextaries, or about I gallons 1 pind English wine measure; the Attio or Greecian about one third more. Among the Romans the amphora was also a dry measure, containing about 5 bushels. The Venetians still have a liquid measure of this name, containing about 16 quarts.—Bgf. from having a handle or ear on each side of the neck

ing about 3 bushels. The Venetisms still have a liquid measure of this name, containing about 16 quarts. Ref. Smith's Dictionary of Greek and Roman Antiquities. ANTERNICALL, in pleaf-i-kani (Lat. amplect; to embrace, condie, a stem), in Bot., a term applied to a leaf which is enlarged at its base, so as to clasp the atem from which it springs, as in fool's parsley.

ANTIGEROUS, in Surg., is a term applied to denote the operation of cutting off a limb or some part of the body. The human frame is so constituted that if one member be diseased, the whole body suffers with it; and frequently the life of an individual may depend upon the removal of an injured or diseased member. The ancients, while they saw the necessity of cutting off a removal of an injured or diseased member. The au-cients, while they saw the necessity of cutting off a limb, shrenk from the operation with dismay, for they knew of no means of stopping the hemorrhage but red-hot irone and boiling oil or resin; and hence, be-sides the suffering entailed upon the patient, their operations were seldom successful. The advance of modern surgery is here very marked, not only in the improved methods and appliances for operating; but, from their increased knowledge of the human body, surgeons are now able to determine with far greater surgeous are now and to determine with lar greater accuracy when an operation is necessary, or, by a minor operation, are able frequently to save a limb, little or at all impaired, which even half a century ago would have been ruthlessly sacrificed; while the recent introduction of amenthetics has been of incitionable value to the patient. An amountation may timable raine to the patient. An amputation may be performed by what is termed the circular, the double-dap, or the single-dap operation. In proceeding to amputate, the patient is first placed in a convenient position, and the main artery is compressed by the tourniquet (see Tounniquer) or by the hand of a skilled assistant. The circular operation is performed by first detaching the skin a short distance below where the amputation is to be made. It is then drawn upwards and the muscles divided down to the bone, which is then sawn through. The arteries are then seized with a small forceps, drawn slightly out, and tied with a thread, after which the skin is brought over the wound, and either stitched or held together by strips of adhe-sive plaster. The double-flap operation differs from the above, in that the skin and muscles are out down the above, in that the skin and muscles are cut down in a slanting manner, on opposite sides, so as to form two flaps, which are then drawn up, and the knife carried round the bone, dividing any flesh that may still be adhering to it; after which the surgeon saws the bone. It is objected to this method, that it makes a greater wound, and that the arteries, from being cut obliquely, will be less securely tied; but it is in favour with many, who maintain that there is little force in these objections, and that they are more than compensate the characterion afforded by the these objections, and the protection afforded by the flaps to the hone. The single-flap operation is seldom resorted to, unless where a portion of the limb is destroyed on one side, and it becomes necessary to take the flap from the apposite side.—Ref. Farguson's

the flap from the appears see.—Any.

In Law, a process there is sugar the per tiread (not the guardan) ming for an explain on infant, or for a married woman, neither of whom can personally institute a still. The next friend is liable for costs if an adverse decision become to against the party for whom he acts. Alien cany is a foreigner here, subject to some prince in friendelip with us. (See ALTER.)

Ammedam, or Durraons, imi-ig-dai'-ie-s, in Bot, sub-ord, of the net, ord. Rosesces. This division includes most of our stone-fruit trees, is the amount the plum, and the cherry. The seeds, flowers, leaves, and young shoots of many of the Amyodales, when moistened with water, yield hydrocyanis, or, as it is commonly termed, prussic nold. Their barks have generally astringent and febrifugal properties, and relieves By the action of the sikelies amygdale, an almond.)

Amyodalun, dis-ig-dai-les (Gr. amygdale, almond), a gen. of plants belonging to the nat. ord. Bosaceæ. The typical species is Asygdales comments, the almond-tree, of which there are two varieties; namely, A. communis, var. duleis, yielding sweet almonds, and A. communis, var. duleis, yielding sweet almonds, and other parts of

munis, var. auccus, yielding aweet amonds, and A. com-munis, var. amara, which produces bitter almonds. The almond-tree grows wild in Syris and other parts of Asia, also in northern Africa, and is extensively cul-tivated in the southern parts of Europe. In England it is grown more for the sake of its early spring blossoms than for its fruit, which seldom comes to perfection. A fixed oil, commonly known as oil of almonds, is obtained by expression from sweet almonds, and the residue, which contains gum, regetable albumen, and emulsion, is sold under the name of almond-powder. Bitter almonds, when merely subjected to pressure, yield a similar oil. They also contain emulsion, and, in addition to this and the other constituents of sweet almonds, a nitrogenous substance, called amygdalin. When bitter almonds are moistened with water, the When bitter almonds are moistened with water, the emulsion and amygdalin mutually re-act upon each other, and form a poisonous volatile oil, which is known as the essential oil of bitter almonds, and which is used, in small quantities, for flavouring custards and pastry, also for scenting soaps. Amygdalus persica is the peach-tree of our gardens, and a variety of the same species produces the nectarine. Peach-blossoms have been employed in medicine as a vermituge, and the kernel of the fruit may be used for the same purposes as the bitter almond. the same purposes as the bitter almond.

the same purposes as the bitter aimond.

ANYE, des-4. (C<sub>2</sub>, H<sub>1</sub>), a compound radicle, discovered by Frankland, by acting on iodide of amylwith zinc. It is an oily liquid, boiling at 311', and homologous with methyl, ethyl, &c. Like them, it forms an oxide or other, and a hydrated oxide, or alcohol.

 $C_{16}H_{11} \}$  O<sub>s</sub>, amylic sleohol, is formed during the distillation of common sleehol from grain or potatoes by the decomposition of the starch contained in them; hence its name. The fusel, or fousel oil of potato-spirit, consists almost entirely of amylic alcohol. It is this substance that gives to many spirits their noxious tons attended that gives to many spirits their notations properties. It may be easily recognized by rubbing a few drops of the spirit on the hands; the vinous alcohol and water evaporate first, leaving the amplies closed behind, which is easily recognized by its characteristic odour. It gives to spirits a flery acrid taste, and is most commonly found in inferior run. taste, and is most commonly found in inferior run. When distilled with dilute sulphuric acid and bi-chromate of potasis, it yields raiseric acid (which see), the salts of which are much used in medicine. Heated with dry phosphoric acid, a hydrocarbon, called amylene, is formed, which has been much used as an abusthetic.

# Amyridaces

AMYRIDACER, dm'-i-ri-dai -se-e, in Bot., the Myrrh AMMEDACRE, dm'.i-ri-dai/se-s, in Bot, the Myrrh and Frankineense ord. There are about 50 species known, all natives of tropical regions. The most important are described under the heads of the genera to which they belong.

AMMEDACRE, dm'.i-ris, in Bot., a gen. of tropical plants belonging to the nat. ord. Amyridaces. Many species yield fragrant resine, and A. balsamysra is said to furnish, besides, a kind of rosewood.

AMA, si'na, a'na, is a termination added to the names of semurable men to designate collections of their

of remarkable men, to designate collections of their of remarkable men, to designate collections of their sayings, extracts from their writings, or, generally, any particulars concerning them. It is put in the form of the Latin neuter plural, and signifies properly matters or things about, or relating to, the person to whose pame it is annexed.—*Examples*: Johnsonians, Walpolians.—*Ana. 3d.*, or *d.*, in medical prescriptions, denotes that an equal quantity of each of the ingredients is to be taken. dients is to be taken.

ANABAPTISTS, cin-a-büp'-bists (Gr. ana, again, and baptize, I baptize), a term applied generally to such Christians as hold that baptism is only to be administered to adults, and insist upon the necessity of a second baptism to all who join their communion. The name, however, is properly applied to a sect of reli-gions fanatics that sprang up in Germany soon after the commencement of the Reformation. Not only did they insist upon re-baptism, but they pretended to divine revelations, and held many absurd or dangerous heresies, as independence of all civil authority, equality of rank, community of goods, plurality of wires, &c. The leader of this sect was one Thomas wives, &c. The leader of this sect was one Thomas Münzer, a pastor in Alstedt, in Thuringia, who, after having adopted the principles of the Reformation, turned aside to these beresies. He subsequently went to Wuldshut, on the borders of Switzerland, which became the chief seat of the body; whence their doctrines spread through Switzerland, Whestphalia, Holstein, and the Netherlands, in spite of the severest persecutions. The rising of the peasantry in Francina, in 1525, fell in with their views, and, in a battle which was fought soon after, Münzer was taken prisoner and slain. The sact, however, still continued to gain ground, and, in 1632, a body of them, under John Matthias, a baker, of Haerlem, and John Boccoldt, a tailor of Leyden, surprised and took the city of Münster. Here they gave themselves up to the greatest extravagances, and Matthias proclaimed himself king of Mount Zion, the name given to Münster. Matthiss was out off in a sally which he headed against the bishop of Münster's troops, and was sucagainst the bishop of Münster's troops, and was succeeded by Boccoldt. At length, the city was taken by the bishop, in 1535, and Boccoldt and many others by the bisnop, in 1535, and Boccold and many others were put to death. The principles of the Annbaptists bad taken deep root in various parts, particularly in the Netherlands. Here Menno Simon, a native of Friesland, and a man of great eloquence, while maintaining the opinions of the Anabaptists upon baptism, preached against their extravagances, and founded the

preached against their extravagances, and tounded the sect of Mennonites. (See Mennonites).

Anadasis, ün-üb'-a-sis (Gr. anabasis, an ascent, an expedition), the name of two ancient historical works. I. The Anabasis of Cyrus, by Xenophon, giving an account of the unfortunate expedition of the younger Cyrus against his brother, the Persian king Artaxerxes, and of the retreat of the Thousand Greeks under Kenophon. 2. The Anabasis of Alexander, by Arrian, of the campaign of Alexander the giving an account of the campaign of Alexander the Great.

ANACABDIACER, an-a-kur'-di-ai'-se-e, in Bot., the ANACARDIACER, an-a-ker-cit-ai-se-e, in Bot., the Cashew.nut, or Sumach ord. of plants. There are 49 genera and about 100 species, nearly all of which are nutives of tropical regions. They yield, by expediation, resins and gums, or acrid and occasionally poisonous juices. The fruits and seeds of some species are edible.

are edible.

ANACARDIUM, din-a-kar'-di-um (Gr. ana, with, kurdia, the heart), in Bot., a gen. of plants belonging to the nat. ord. Anacardiacea. The species A occidentale, the cashew-nut, a native of the West Indies, is remarkable for its large fleshy peduncle, which is eaten as a fruit, and its juice, when fermented, forms a kind of wine. Each peduncle bears a small kidney-shaped nut, the perioarp of which is very aorid, but the seeds are edible. By roasting the nut, the scridity

# Analogy

may be destroyed, and the seed will greatly improve in flavour. The milky juice will stain linen black.

ANGERONISM, in-ik'-ro-nism (Gr. ana, upwates, chrones, time), is a name given to an error in chronelogy, by which the date of an event is placed earlier than it really happened. Anchronisms are net unfrequently to be found in works of art, and are sometimes introduced for the sake of effect; as where Schiller, in his "Piccolimini," speaks of a "lightning-conductor," sithough not invented till 160 years later. An arror on the other side, where an event is placed. An error on the other side, where an event is placed later than it should be, is called a parachronism.

later than it should be, is called a parachronism.

AMACONDA. (See SMARES.)

AMACYCLUS, ån-a-si'-klus (Gr. ana, in the form of, and kyklos, a circle), in Bot., a gen. of plants belonging to the nat. ord. Composite. The root of A. pyrethrum, pellitory of Spain, is employed in medicine as an energetic local irritant and sialogogue, its properties depending on the presence of a volatile oil.

ANEMIA, d-ne'-mi-a (Gr. a, not, and aima, blood), in Path., a term used to denote a deficiency of the red globules or colouring matter of the blood. It is characterized by a nele warv complexion, and a nallor

characterized by a pale waxy complexion, and a pallor in those parts, as the lips, which are generally suffused. It is to be treated with pure air, nourishing diet, and

tonics, such as iron.
Anæsthetics, an'-ees-thet'-iks (Gr. a, privative, and aisthanomai, I feel), a term given to those substances which produce insensibility in the whole or part of the human body, generally by acting on the nervous system. The most familiar instance of anæsthesia is that produced by an overdose of alcohol, in the case of drunken people, who become utterly insensible to pain. Nitrous oxide, or laughing gas, was the first anesthetic which was used for the production of insensibility to pain under surgical operations. This was superseded by ether, which in turn gave way to shlo-roform. (See CHLOROFORM.) Amylene has been much employed as an anæsthetic, but has been abandoned. Rerosolene, a product of coal tar, is much used and recommended by American practitioners. It is almost impossible to overrate the advantages attendant upon the judicious use of anæsthetics in surgical operations. Countless lives have been saved by them, and operations have been performed under their influence undreamt of by surgeons twenty years ago. The injurious effects attributed to chloroform are so few and far between, as to be nothing in comparison with the benefits arising from its use. This latter remark a specially to its administration during childbirth. This latter remark applies

specially to its administration during childbirth.

Anagana, in a-gram (Gr. ana, backwards, and
gramma, a letter), is the formation of a new word or
phrase out of another word or phrase, by the transposition of the letters; as, evil, live; Gulenus, Angelus;
Horalio Nelson, Honor est a Nilo.

Anagyens, anagyi-sris (Gr.), in Bot., a gen. of
leguminous plants. The seeds of A. fatida are very

ANALCIME, d-näl'-seem, a silicate of soda and alumina, remarkable for peculiar optical properties possessed

by it. (See Polarization of Light.)
Analytics, on-e-lep'-tiks (Gr. analepsis, resuming, recovery), a term in Med., applied to those means that are resorted to, to restore the body to a state of health, whether medicines, diet, or regimen.

ANALOGY, a-nal-o-je (Gr. analogia, the same ratio or proportion), properly signifies a similarity of ratios or relations, though it is frequently applied, also, to a similarity of things. A ratio or relation between two objects denotes that they are compared together in common, or to some quality which they both possess in common, or to some manner in which the one is affected by the other. In this way we speak of one ancher of the onner. In this way we speak of one thing being greater, smaller, or more beautiful than another; of the relation of a child to his parents; of a prince to his people. It is, however, only when we come to compare relations, when we find that the relation or ratio of two things is like the relation of two there things that we recompled here a resolution. then or ratio of two things is like the reason of two other things, that we properly have an analogy. A may resemble B, but there is no analogy between them; but if A bears the same relation to B that C does to D, then there is analogy. In relation we have only two terms or objects of comparison; in analogy we must have four, though it is not necessary that all the four be different; for A may bear the same relation

## Analysis

to B that B does to C. Two things may be connected by analogy, though they bear in themselves no resem-blance to each other; for, in analogy, all other attri-butes are kept out of view but those in which they agree. Thus, the bark of a tree is analogous to the skin of an animal, though there is no resemblance between them. In reasoning from analogy, we proceed upon the assumption that things which have many observed attributes in common have other not observed attributes, also in common. If we have observed that two or more things agree in several internal and essential characters, we are disposed to conclude that they agree likewisee in all other essential characters,—that they belong to the same class. Analogy concludes from something observed to something not observed; from something within the sphere of actual experience to something beyond it. Analogy can only give us a high degree of probability, for the simple reason, that it is impossible, under any condition, to infer the unobserved from the observed. "Analogy," says Sir W. Hamilton, "is certain, in proportion—1, to the W. Hamilton, "is certain, in proportion—1. to the number of congruent observations; 2, to the number of congruent characters observed; 3, to the importance of these characters and their essentiality to the since of these characters and their essentiality to the object; and 4. to the certainty that the characters really belong to the objects, and that a partial correspondence exists. Like induction, analogy can only pretend, at best, to a high degree of probability. It may have a high degree of certainty, but it never reaches to necessity. —Ref. Hamilton's Logic; Mill's Logic; English Cyclopedia.

ANALYSIS, a-nal-i-sis (Gr. analyo, Iloosen or untic),

in Log., is a method of reasoning by which we resolve or separate a whole into its constituent parts, and is opposed to Synthesis, in which the parts are collected

into a whole.

into a whole.

ANALYSIS, in Chem., is the term applied to that important branch of research which has for its object the determination of the constituent parts of compound substances. The word is also used, in a restricted sense, to denote a series of operations for ascertaining the constituents of a single compound. We may, therefore, speak generally of chemical analysis, or refer particularly to the analysis of a certain sait. Analysis being the separation of the component parts of a substance, is directly conosed to component parts of a substance, is directly opposed to synthesis, which may be defined as the putting together of elements so as to form a compound. In most of elements so as to form a compound. analytical operations, however, the chemist works by synthesis, as he usually separates two bodies by means of a third, which unites with one of them. (See AFFI-NITY.) It is not ulways necessary to actually separate as consionally charges of colour, or other results, on the addition of the proper tests, indicate the consti-tuents. If the analyst merely seeks a knowledge of the general nature of the substance under examination, he is satisfied when, by the amplication of cortain tests. the component parts in order to ascertain their nature, ie is satisfied when, by the application of certain tests, and by the performance of certain operations, he has obtained evidence of the presence of those elements of which the compound is made up, and the analysis he performs is called a qualitative one; but if he desires to ascertain not only the nature but the actual amount of the elements present, he must separate the consti-tuents of the compound completely from each other, and obtain them either pure, or in some well-known form of combination; he then appeals to the bulance or measure, and the analysis he performs is called a quantitative one. The balance was formerly employed whenever great accuracy was required; but of late, methods of wolumetric analysis have been brought to great perfection. By volumetric analysis is underood the use of messured bulks of test-liquids, containing known quantities, by weight, of certain sub-stances capable of producing, with a solution of the assay, sufficiently marked effects to show with pre-cision the complete conversion of the body sought to be estimated, into a compound, the nature of which is perfectly known. The methods employed for deter-mining the amount of real gold or alkali in certain commercial products, will be fully described in another portion of the work. (See VOLUMETRIC ANALYSIS.) Minerals may be analyzed qualitatively by needs of the blowpipe. (See Blowpipe.) An analysis is said to be presided when the compound substance is resolved

#### Anathema

into components which are themselves compound, and ultimate when the decomposition is carried to its furtheat limits, that is to say, when the compound is resolved into its elements, or the simplest forms of matter. Thus, wheat flour, when subjected to proximatter. Phus, wheat flour, when subjected to proximate analysis, yields gluten, albumen, starch, sugar, gum, oil, and saline master; but each of these proximate principles is a compound, and may be further divided by ultimate analysis; the gluten and albumen into the elements carbon, hydrogen, oxygen, nitrogen, sulphur, and phosphorus; and the starch, sugar, gum, and oil, into the first three of these elements. (See Chemister, Test.) Ref. (Elementary work), Howman's Pruccical Chemistry; (complete manual), Fresenius's Elementary work). senius's Chemical Analysis.

Analysis, Eudiometrical. (See Eudiometry.)
Anamieta, an-a-mir'-ta, in Bot., a gen. of
plants belonging to the nat. ord. Menisperwacea. plants belonging to the nat. and. Menispermacea. The species Anampta paniculate, or eocculus, is a beautiful climbing plant, which is a native of the Malabar coast and the Indian archipelago. Its fruit is poisonous, and is extensively employed by poachers for taking fish and game, and by dishonest publicans for adulterating maltliquors. (See Cocculus

Indious.)

Ananassa, čn-a-nās'-sa, in Bot., a gen. of plants, belonging to the nat. ord. Bromeliaceæ. The species A. sativa furnishes the delicious fruit known as the pine-apple. A large number of pine-apples are now brought to England from the Bahama Islands, but in flavour and lusciousness they are much inferior to those cultivated in hothouses. The fibres obtained from the thick leaves of the plant have been made into paper, cordage, and textile fabrics.

ANAPEST, an'-a-pest, in Greek and Latin Metre, is a foot consisting of two short syllables followed by a

long one.

ANARCHY, an'-or-ke (Gr. a, not, and arche, govern-ment), is a term applied to a society living without any regular government; it may be as savages, in a state of nature, or a people who have thrown off the

state of nature, or sovereign power.

Anas. (See Duck.)

Anastatioa, ön-a-stati-i-ka (Gr. anistemi, I rise again), in Bot, a gen. of cruciferous plants.

The principal species is A. hierochemina, the rose of Jericho, which is found in the deserts of Egypt and Syria. This plant is remarkable for its hyand Syria. This plant is remarkable for its hyand Syria. grometric properties; thus, when full grown, and its branches have become dry and withered, it contracts so as to assume the form of a ball, in which state it is blown hither and thither by the winds; but, if it then meets with any moisture, it uncoils and for a

time seems to regain life.

ANASTATIC PRINTING.—This process is founded on the principle that oil repels water, and vice versa; on the principle that oil repels water, and vice versa; that metals repel water more than oil, a weak solution of gum, or phosphoric acid, and that new print will transfer itself by means of pressure to any smooth surface. A printed page or engraving is moistened with a weak solution of phosphoric acid in gum-water, and pressed with considerable force on a sheet of zinc. The oily printing ink leaves its impression on the plate in the form of a fac-simile of the original, the space between the letters or lines being filled up with water. An inked roller is passed over the plate, and leaves the ink only on the impression; the rest of the plate being wet, repelling the oily matter. Any number of impressions may be pulled, all perfect fuc-similes of the civinal. (See Lyncon, pressions may be pulled, all perfect fuc-similes of the

original. (See Lithography and Zincography.)
Anastomosis, divisionovisis (Gr. ana, through, and stoma, a mouth), a term used in Anat. to denote the communication of the blood-vessels with each other. The necessity of a constant supply of blood to every part of the human body has led to a wise provision, by which, though even one of the larger arteries become obstructed, there are numerous smaller ones communicating with the same part, which, by the in-creased pressure upon them, become enlarged, and supply its place.

Anathena, a näth'e-ma, a term derived from the Greek, and signifying properly something set apart for holy purposes, usually an offering or present made to some deity, and placed in a temple. It also denoted an animal offered in sacrifice to the gods, and hence

came to signify a person devoted to destruction. In the Church the term came to be used as a form of excemmunication, but differed from simple excommunication in being attended with executions and curses. When a heretic renounced his effors, and was received into the bosom of the Church, he was accustomed to declare his heresy "anathema," or a thing accursed.

ANATOMY, a-null'-o-me, is a term derived from the Greek verb autenso. I out up, and properly signifies the separation of a thing into parts by cutting. All material substances either are or have been, or are not and have not been, possessed or endowed with life. The former have an organized structure, in which, in the living state, changes take place, and processes are carried on necessary to their existence. The latter are composed of homogeneous particles, and are subject only to mechanical or chemical changes. In the former are comprehended all plants and animals, in the latter all mineral or inorganic substances. It is to the former of these two great divisions that the term anatomy is applied. It is the art of dissecting organized bodies for the purpose of ascertaining their internal structure; it is also the science which deals with the knowledge thus acquired, and deduces general principles from it. As organized bodies naturally form themselvs into two distinct classes,—plants and anithemselve into two distruct classes,—plants and animals; so we have vegetable anatomy, or the anatomy of plants, and animal anatomy, or the anatomy of animals. Animal anatomy, again, is subdivided into comparative anatomy, which treats of the structure of all animals except man, and human anatomy, which deals with the structure of man only. It is to this last that the general term anatomy is usually applied. last that the general term anatomy is usually applied. Human anatomy, or anatomy proper, then, treats of the several parts and organs of the human body, in respect to their form, structure, and relation to each other. It is usually divided into general, descriptive, and pathological. General anatomy treats of the nature and general properties of the separate substances of which the body is composed, separate substances of which the body is composed, not as these exist combined in special organs, but as they form distinct and peculiar substances. Descriptive anatomy comprehends a description of the several parts and organs of the body, with an account of their situation, connections, and relations, as existing in the natural and healthy state. Pathological, or morbid anatomy, traces and describes the changes produced by discret, when healthy structures whether existing by disease upon healthy structures, whether existing in individual organs, or in the primitive or common substances of which these organs are composed. As an account of the various parts and organs of the human body, as well as of the diseases to which they are subject, will be found under their several names, in other parts of this work, it is unnecessary to do more here than give a short summary of the subject, referring to these articles for more special information.

General Anatomy.—The human body consists of solid and fluid substances, the fluid bearing to the solid parts a general ratio of from 7 to 1 to 9 to 1. The fluids of the body are various, but may be divided into three classes—the circulating nutritious fluid called the blood; the fluids which are incessantly poured into it for its renewal, viz. the chyle and lymph; and the fluids which are separated from it by secretion, as salive, bile, gastric juice, &c. The blood is that well-known red fluid which, by means of the heart, arteries, and veins, circulates through all parts of the system, and supplies the waste that is constantly going on. The chyle is a milky fluid, separated from the stomach into the small intestines, and become mixed with the bile and pancreatic juice. It is absorbed by the lastcals, and conveyed by duets or canals to the receptaculum chyli, where it is taken up by the thoracic duct, and poured into the blood. The lymph is colourless fluid, like water, taken up by the hymphsia vessels, which pervade almost every part of the body. It seems to differ little from chyle, except that the lutter contains a greater preponderance of fatty matter. The greater portion of the lymph is poured into the receptaculum chyli, where it is becomes mixed with the chyle, and is carried with it into the blood; that, however, collected from the right side of the head and chest, and cright upper limb, is conducted into the right

subclavian vein, by the right lymphatic or right thoracic duct. The accretions are those fluids secreted or separated from the blood. The term is sometimes used to include the excretions which are thrown off from the body as useless or noxious, as urine from the bladder, perspiration from the skin; but it is properly applied only to such products as are secreted from the blood, but still retained in the system for the performance of certain subordinate actions. These are,—L. saliva, secreted by the salival glands of the mouth; 2. gastric juice, by the stomach; 3. pancreatic juice, by the pancreas; 4. bile, by the liver; 5. tears, by the lachrymal gland; 6. milk, by the mardmary glands; 7. somen, by the testes; 8. oil, by the vessels of the adipose tissue; 9. synovia, by the mucous glands. The organized solids of the human body are usually divided into the following asynetees elementary issues.

divided into the following seventeen elementary tissues: -1. Bone, or osseous tissue, which forms the framework of the body, to which the other structures are statehed, or in which they are contained. 2. Muscular tissue, consisting of fine fibres, which are for the most part collected into distinct organs called muscles, by means of which the active movements of the body are performed. 3. Adipose tissue, which constitutes the fat of the body as well as the marrow of the hones.

4. Arcolar, cellular, or connective tissue, a soft filementous substance of considerable tenacity and elasti-city, which is extensively distributed over the body, and s the connecting medium of all the other tissues. 5. Fibrous tissue, formed of a number of minute fibres or information of a number of munite fibres running chiefly parallel to each other, and sparingly supplied with blood-vessels or nerves, and used for connecting, enveloping, or binding together, various parts of the human body, as tendons, ligaments, fascise, periosteum, perichondrium, dura mater. 6. Eleation really tierm a harmonical harmonical. cie, periosteum, perionondrum, dura mater. 6. Silas-tic, or yellow tissue, characterized by possessing a high degree of elasticity, and employed wherever that quality is required, as in forming the spinal ligamenta subflava. 7. Cartilage, an opaque substance, usually of a pearly or bluish-white colour, but sometimes yellow, covering the articular extremitics of the bones, yellow, covering the articular extremities of the bones, connecting the surfaces or margins of immovable bones, or liming the walls of certain cavities, also found in the ear, nose, larynx, &c. Fibro-cartilage is, as its name indicates, a structure intermediate between fibrous tissue and cartilage, partaking, in some measure, of the firmness of the one with the elasticity of the other. 8. Nervous tissue, which goes to form the nervous system. 9. Blood-vessels, comprising the arteries by which the blood is conducted from the heart to all parts of the body; the veins, by which it is brought back again to the heart; and the capillaries, minute vessels by which it is carried from the extremities of the one to those of the other. 10. Absorbent vessels and glands, comprising the lacteals and lymphatics, together with the glands in connection with them. 11. Scrous and synovial membranes, which resemble each other in general form and structure, but are distinother in general form an structure, but are distin-guished by the nature of their secretions; the former lining the cavities of the body which have no outlet, as the peritoneum in the abdomen, the pleure and peri-cardium in the chest, and secreting a transparent and nearly colourless fluid, which moistens the surface; the latter lining the cavities of the joints, and secreting a viscid fluid which lubricates their surface. 12. Muthe body exposed directly or indirectly to contact with the atmosphere, and secretes a fluid of a more consistent and tenacious character than the serous membranes. 13. Secreting glands, a class of organs widely differing from each other in their nature and form, but all devoted to the function of secretion. 14. Vascular or ductiess glands, so called from their general resemblance to secreting glands, but differing from them in having no duct for the conveyance of their secretions, which are reabsorbed or filtered through the tissues, or find an outlet by bursting. 15. Skin,—cutis vera, derma, or occium, the innermost of the three structures derms, or corrum, the innermost of the three structures that go to make up what is commonly termed the skin, and which covers the whole body. 16. Figment, a black or dark-coloured substance occurring in various parts of the body, and giving colour to the skin of the negro and other dark races. 17. Epithelium, a thin transparent structure covering the whole surface of the

#### Anatomy

body, as well as the walls of the different cavities, and named differently, according to the parts which it covers; as, epidermis, covering the skin; the epithelium

covers; as, epidermis, covering the akm; the epidemium of mucous membranes, &c.

Descriptive or Special Anatomy, is commonly divided into several branches, according as it regards the bones (Osteology); the articulations; the muscless (Myology); the blood-vessels and absorbents (Angiology); the uer-

the blood-vessels and absorbents (Angiology); the nervous system (Keurology); the organs of sensation, respiration, digestion, &c. (Splanchnology).

Outcology.—The number of bones in the human body is variable; but in the adult they are estimated at about 244. They are usually divided into long, flat, and irregular;—long, as in the thigh and leg; flat, as in the skull and pelvis; irregular, as in the hands and feet. Bones are covered with a peculiar membrane called the periosteum, which serves to conduct the blood-vessels and nerves. The osesous skeleton is divided into head. The osseous skeleton is divided into head, and nerves. trunk, upper and lower extremities. The head comtrunk, upper and lower extremities. The head com-prises the bones of the cranium and those of the face, including three common to both. The bones of the cranium are eight in number,—the frontal, in the fore part of the skull; the two parietal, forming a portion of its sides and all its superior part; the occi-pital, forming its lower and back part; the two temporal, forming the lower part of the sides and part of the base; the sphenoid, in the middle of the base; and the ethmoid, in the middle of the fore part of the base. The bones of the face are fourteen in number,— the ossa nasi, which form the arch of the nose; the ossa lacrymalia, at the fore part of the inner edge of the ocular orbits; the malar bones, forming the prominences of the cheeks; the upper maxillary bones, forming the upper jaw, and containing the upper teeth; the ossa palati, situated at the posterior part of the palate, the nose, and the orbits; the vomer, a flat bone, forming part of the septum of the nose; the ossa turbinata inferiors; and the lower maxillary bones, forming the interiors; and the lower maintage object, so that the lower jaw, and containing the under teeth. There are thirty-two teeth,—sixteen in each jaw; viz., four incisors or front teeth, two cuspidsti or canine, four bicuspidsti, and six molares. The last molar on each side is called the dens sapientia, or wisdom-tooth, from not contain the same of treatment. The containing the last molar on the last molar or each side is called the dens sapientia, or wisdom-tooth, from not appearing till about the age of twenty-one. The os hyoides, or by oid bone, is placed in the anterior and upper ayones, or myold bone, is placed in the anterior and upper part of the neck, and hasp, o sessous connection with any other bone. The trunk is divided into the spine, thorax, and pelvis. The spine is a pyramidal column, extending from the head to the pelvis, and is composed of twenty-four bones, termed vertebræ. Each vertebra consists four bones, termed vertebra. Lach vertebra consists of a body and seven processes, and has a foramen, or ring, through which the spinal cord passes. They are divided into three classes,—the cervical, including the first seven; the dorsal, consisting of twelve, which are larger than the cervical, and are distinguished by have the consistency of the constant of the contract of the first seven; the dorsal, consisting of twelve, which are larger than the cervical, and are distinguished by having their sides and transverse processes depressed for connection with the ribs; and the lumbar, consisting of five, which are larger than any other. The first two cervical vertebræ differ from the others, and are known as the atlas and the axis, or vertebra dentata. There are likewise five so-called false vertebræ, on account of their being separate in early life, but afterwards uniting to form the os sacrum, which constains the principal organs of circulation and respiration, is the largest of the three great cavities connected with the spine, and is formed by the sternum and costal cartilages in front, the twelve ribs on each side, and the dorsal vertebræ behind. The sternum is a fist narrow bone, situated in the anterior part of the thorax, and connected with the ribs by means of the costal cartilages. The ribs are twenty-four in number, twelve on each side, of which the first seven are termed vertebro-sternal, or true ribs, and are attached to the sternum; three are attached to the termed, vertebrate of locating ribs, from their anterior extremities being free. The pelvis, or lower cavity of the trunk, consists of four bones,—the os sacrum and os coccygis behind, and the two osas innominats on either side. The occogyis, which forms the terminal bone of the spine, is sometimes regarded, like the os sacrum, as composed of four false vertebræ, which are at first distinct, but afterwards become united. The ossa innominata are two irregularly-

# Anatomy

enaped bones, situated one on each side of the pelvis, and consisting of three parts, the ilium, ischium, and pubis, firmly united in the adult, but distinct in theyoung subject. Each of the two upper extremities is composed of the boxes of the srm, the forearm, and the hand, and is united to the trunk by means of the scapula side a flat triangularly-shaped bone, placed upon the upper and back part of the thorax. The clavicle, or collarbone, is a long bone, something in the form of the italic letter f, and situate between the top of the sternum and the acromich process of the scapula. The arm has only one bone, the os humeri, which extends from the scapula to the bones of the forearm. The forearm consists of two bones, the radius and ulna, which are consists of two bones, the radius and ulna, which are parallel, and play upon each other; thus admitting of freer motion in that part. The radius, so called from its resemblance to the spoke of a wheel, is situate or the resemblance to the spoke of a wheel, is studied or the outer side of the forearm. Its upper end is small, and forms only a small part of the elbow-joint, while its lower extremity is large, and forms the chief part of the wrist-joint. The ulna is placed at the inner side of the forearm, and differs from the radius in being larger at the upper than at the lower extremity. The bones of the hand are divided into the carpus, the metacarpus, and phalanges. The bones of the car-pus, or wrist, are eight small bones, arranged in two metacarpus, and phasanges. The once of the carpus, or wrist, are eight small bones, arranged in two rows, the upper row comprising the scaphoid, semi-lunar, cunctiorm, and pisiform,—the lower, the trapezium, trapezoid, os magnum, and unciform. The metacarpal bones, or bones of the palm, are five in number, and correspond to the flugers. The phalanges, or bones of the flugers, are fourteen in number, each finger, with the exception of the thumb (which has only two), having three of them. The upper and lower extremities bear a great resemblance to each other in the nature and form of their bones. Like the upper, each of the lower extremities consists of three distinct parts—the thigh, leg, and foot. The thigh is composed of a single bone, the os femur, which is the longest and largest in the body. The upper part forms a round head, which is inserted into a deep cup-like cavity of the os innominatum, called the acetabulum: the lower terminates in two protuberances, known as the inner and outer contwo protuberances, known as the inner and outer con-dyles, separated posteriorly by a deep fossa, called the inter-condyloid. The leg consists of three hones,—the patella, tibia, and fibula. The patella, or knee-pan, is a small, flat, triangular bone, of a spongy texture, situated at the anterior part of the knee-joint, between the femur and the tibia. The tibis and fibula in the leg resemble the radius and ulna in the forearm; the tibis is, after the femur, the largest bone of the body; it is situate at the anterior and inner side of the leg, articulating with the femur above and the astragalus below. The fibula is considerably smaller than the articulating with the femur above and the astragalus below. The fibula is considerably smaller than the tibia. Its upper extremity is small, and placed below the level of the knee-joint, but the lower extremity projects below the tibia, and forms the outer sukle. The foot, like the hand, is composed of three classes of bones,—the tarsus, the metatarsus, and the phalanges. The tarsus is composed of seven bones,—the os calcis, astralagus, cuboid, scaphoid, and three cuneiform. The metatarsal bones are long small bones, five in number, connected at the one extremity with the in number, connected at the one extremity what the tareal, at the other with the phalangeal bones: these last go to form the toes, each of which has three, except the great toe, which has only two.

Articulations.—The different bones of the skeleton

are connected together in various ways, and such connections are termed articulations. They are of various kinds, but are usually divided into immovable, movable, and mixed. Immovable articulations exist where flat and broad bones are united to inclose important organs, as in the cranium and pelvis. parts the edges indent or interlock each other; in others they are brought into close contact, or are united together by a thin layer of cartilage. The movable articulations are of various kinds, according to the kind of motion required. In such cases, the bony striculations are of various kinds, according to sake kind of motion required. In such cases, the bony surfaces brought into contact are covered with cartilage, bound together by ligaments, and lined by synovial membrane. Mixed articulation prevails where only a slight degree of motion is required, combined with great strength, as in the vertebres. The

conclusions which are necessarily true, from the opposite being impossible. An apodistical argument, therefore, is one which excludes the possibility of the opposite.

opposite.

Aroszz, &p'-o-je (Gr. ape, from, and ge, the earth),
means the greatest distance of any heavenly body from
the earth; but it is applied more particularly to the
sun and moon. The former is in its apogee in its
apparent course when the earth is in its aphelion; the
moon is in its apogee when it reaches that point in its
ability in the carth is presented by the earth.

orbit which is most distant from the earth.

APOLLIMARIANS, å pol'-li-nai'-ri-äus, an ancient sect of heretics which arose in the latter half of the 4th century, and were named after Apollinaris, bishop of Laodicea. They denied that our Saviour had a reason. able soni, and asserted that its place was supplied by the Logos, or divine nature. This dectrine was conthe Logos, or dune nature. This decertine was con-demned as heretical by various councils, including that of Constantinople, in 391. The Apollinarians were also forbidden by imperial edicts, in 388 and 397, from holding religious assemblies, and in 428 from having pastors or residing in cities; and they at length entirely disappear.

APOLLO BELVIDEER, &-pol'-lo bel'-vi-deer, the name commonly borne by a beautful statue of the heathen divinity Apollo or Phochus (see Beeton's Dictionary of Biog.), which about the close of the 16th century, was found in the ruins of the ancient Antium. Pope Julius II. bought it, and had it placed in the Belvi-dere of the Vatican at Rome; whence the name. It is generally admitted to be the most magnificent work of generally admitted to be the most magnificent work of art in existence, a copy of it being used in every Euro-pean school of art as a drawing-model for students. In this chef-d cauve of Grecian art, the divinity is seen in a standing position, almost nude: over his right shoulder is suspended a quiver, upon his extended left arm he carries his pallium, and in his hand is seen the remnant of a bow, from which an arrow is supposed to have been discharged at the serpent Pethor. The have been discharged at the scrpent Python. whole statue is characterized by a combination of grace, beauty, and symmetry of proportion. By some critics it is held that Pliny makes allusion to this beautiful that I have that I have generally received opinion is that the sculptor is entirely unknown. For a time the statue was kept in Paris, whither it had been conveyed by the emperor Napoleon I.; but at his downfall this marrel of antique art was restored to its former home in the Vatican.

Apologram, d-pol-o-jet'-ik (Gr. apologeomai, I speak in defence of), is a term applied to designate something said or written by way of excuse or apology for any

action or person; as an apologotic essay.

Arologitics, b-pol-o-jett-ike, in Theoft, is a term applied to that branch of divinity which has for its object a systematic arrangement of those external and internal evidences of Christianity by which Christians Internal evidences of Unrastranty by which Unrabates are enabled scientifically to justify the peculiarities of their faith. Apologetics defend the fundamental principles of Christianity against unbelievers; polemics defend one particulur belief, or class of beliefs, against others. Apologies for certain doctrines of Christianity, or defending it from charges brought against it by its opponents, have appeared from very early times; as the apologies of Tertullian, Justin Martyr, Origen, and others; but it was not till the 18th century that and others; but it was not the the four century that apologetics came to be regarded as a distinct branch of theological science. The name was first brought into use by J. G. Planck, in his Einleitung in die theologischen Wissenschaften, 1794. The first work, however, which can be said to have treated the subject of complexities in a scientific warmen in that of P. E. ever, when can be said to have treated the subject of apologeties in a scientific manner is that of P. E. Müller, published at Copenhagen in 1810, and entitled Kristeliy Apologuist, eller Videnskabelig Udvikling of Grundene for Kristendommens Guddommetished (Christendommens Guddommetished (Christendommens) tian Apologetic; or, a Philosophical Exposition of the Arguments for the Divine Origin of Christianity). Since that time, various works have appeared on this subject, particularly in Germany. The fundamental principle of apologetics is the necessity of a superprinciple of approgresses are necessity of a super-natural revelation. It treats of the logical, moral, and metaphysical possibility of a revelation; of the necessity of a revelation; and demonstrates, from in-ternal and historical evidence, the truth of revelation.

convey some moral truth. The fables of Alsop are of this class.

Arology, d-pol-o-je(Gr. apologia, a defence, apology), originally denoted a defence made in a court of justice in favour of one accused. As these were frequently earefully written out, and afterwards made public, it came to be applied to works written in defence of any particular person or doctrines. Of this nature are the apologies of Socrates, attributed to Plate and Xenoapologies of Socrates, attributed to Plato and Keno-phon. The word was adopted by the Christian fathers, and applied by them to works in defence of certain doctrines of Christianity. (See APOLOGETICS.) In ordinary language the word is used at present in the sense of asking pardon or excuse for some offence.

APOWEROSIS, dp-0-nu-vo-sis (Gr. apo, from; neuron, a tendon), in Anat., the membrane or tendon by which the muscles are attached to a bone, called aponeurosis of insertion. The term is also applied to a membrane within the substance of muscular fibres, called aponeurosis of intersection; also to a membrane surrounding a muscle and preventing its displacement,

called enveloping sponeurosis.

AFORITHEGH, ap-o-them (Gr. apophthegma, an utterance), a short pithy saying or maxim, conveying a great moral truth in few words. The wise men of antiquity, and the oracles of the gods, frequently expressed themselves in this way. Among the bestknown collections of apophthegms are those made in ancient times by Plutarch, and those in modern times

APOPHYLLIC ACID, il-pof'-il-lik, an acid obtained from narcotine, the crystals of which resemble those of

apophyllite; whence its name,

APOPHYLLITE, "poj"-il-lite (Gr. apophullico, to strip of leaves), called also the "fish-eye stone," a mineral or teaves), called also the missey stone, a mineral cocurring in white, pearly, square prisms or pyramids. It is a silicate of lime and sods, and is found in the magnetic iron deposits of Sweden and Norway. So named from its tendency to exicliste under the blow-

APOPLEXY, ap-o-plex'-c (Gr. apoplexia, a sudden blow, a privation of sense and motion), in Path, is the name of a disease characterized by a sudden abolition or great diminution of the powers of sensation and voluntary motion, while the organic functions of the body,—circulation, respiration, secretion, &c., are still carried on, but usually in a more or less impaired state. The attack is sometimes instantaneous; at other times it comes on by degrees. The face is generally flushed; the breathing slow, deep, and stertorous, the pulse fuller, stronger, and slower than natural, and the skin covered with a cold clammy perspiration; sometimes, however, the pulse, instead of being full and strong, is weak and intermitting, and the face pale and dejected. Apoplexy springs from a diseased condition of the brain, and is occasioned by whatever unduly impedes or accelerates the circulation of the blood within the brain, or exerts a certain degree of pressure upon it. Hence, violent exertion, either of mind or body, great mental auxiety, intemperance in eating or drinking, are among the exciting causes of it. Males are much more liable to it than females, and it is most common between the ages of fifty and seventy. A man of a sanguine plethoric temperament, with large head and full neck, is most liable to its attack, though lean persons are also frequently among its victims. Though the attack is usually so sudden, it is not without its premonitory symptoms, which, though numerous and diversified, are yet obvious and easily understood. Among these, are excessive drowsiness, giddiness and headache, with frequently dulness of hearing, imperfect or disordered vision, noise in the ears, loss of memory, &c. Sometimes the attack is preceded by paralysis affecting the speech, hands, feet, or other part of the body, and frequently it is succeeded by paralysis. When judicious remedies are or other part of the body, and respectively, and respectively precipies. When judicious remedies are adopted in time, an attack may generally be averted or rendered comparatively mild. Much necessarily depends upon the patient himself; upon his avoiding those states and modes of life that predispose to it. and metaphysical possibility of a revelation; of the test precise, and attending necessity of a revelation; and demonstrates, from internal and historical evidence, the truth of revelation. Apologous, a fable,) is a ing to the causes that may have induced it. In some fable, parable, or short fictitious story, designed to

in others stimulating remedies are what may be rein others stimulating remedies are what may be required. In all cases, however, the patient's head should be raised, the head and neck hared, and the freest circulation of fresh air promoted; and, as soon as possible, purgative medicines should be administered. The attack may lest from a few hours to two or three days; and even when it does not destryo life, it usually gives a shock to the constitution, which is seldom entirely recovered from.

APOELA, & Poor'-i-E (Gr. aporeo, I doubt), is the name of a figure in Rhet., by which the speaker seems to be in doubt whether to say anything or not, or where to begin in a multitude of arguments; as, 'Of what shall I first complain?' 'Where shall I seek to be a company of the pool of the complain of the shall I seek to be a complain or the complain of the compla This figure is sometimes used with great

effect.

APOSIOPESIS, d-po'-si-op'-e-sis (Gr. aposiopae, I am silent), is a figure in Rhet., in which the speaker breaks off abruptly in the middle of a sentence, leaving his hearers to supply what he was going to say; as, 'His conduct was—but we must not lose time in words.'

It usually denotes great anger or grief.

APOSTACY, a-pos'-ta-se (Gr. apostusis, a forsaking, ANOSTACY, a-por-uses (or apparate, a normaning, descripin), is a going sway or defection from one's original profession or party. In Theol., it is a forsaking or renouncing of one's religion, either openly or virtually. The primitive Christian church distinguished or renouncing of the straight church distinguished several kinds of apostacy:—1. Those who went entirely from Christianity to Judaism; 2. those who complied with the Jews in many of their unlawful ceremonies, and profession of their religion; without making a formal profession of their religion; 3. those who mingled Judaism and Christianity to-

3. those who mingled Judaism and Christianity together; and 4. those who relapsed into paganism.

Apostacy, in Law, a total renunciation of Christianity, by embracing either a false religion, or entertaining no religion at all. The offence can only take place in such as have once professed the Christian religion. Heavy penalties, including loss of life, formerly attached to apostacy. Now, by 2 & 10 Will.

III. c. 32, it is provided that if any person educated in, or having made profession of the Christian religion, shall, by writing, printing, teaching, or advised suggests. in, or having made profession of the Christian religion, shall, by writing, printing, teaching, or advised speaking, deny the Christian religion to be true, or the Holy Scriptures to be of divine authority, he shall, upon the first offence, be rendered incapable to hold any office or place of trust, and, for the second, be rendered incapable of bringing any action, being guardian, executor, legatee, or purchaser of lands, and shall suffer three years' imprisonment without bail. To give room, however, for repentance,—if, within four months after the first conviction, the deliuquent will in open court publicly renounce his error, he is discharged for that once from all disabilities.

APOSTASIACEE, a pos'-tii-si-ai'-se-e, n nst. ord. of plants, named after the gen. Apostasia, and belonging to the class Monocotyledones and sub-class Petaloidea. Herbs with regular hermaphrodite flowers, growing in the damp woods of tropical India. There are three genera and five species. Their properties are alto-

gether anknown.

APOSTATE, a-pos'-tait (Gr. apostasis, a desertion), one who openly abandons the true religion. In Keel.

one who openly abandons the true religion. In Kecl. Hist. it is applied, by way of special imputation, to the emperor Julian, who, though at first professing Christianity, when he came to the throne openly renounced it, and did all in his power to re-establish paganism.

A POSTLIN, a-post-el (Gr. apostolos, a messenger), properly signifies one sent or delegated by another upon some business. In Theol. it denotes, by way of eminence, one of the disciples specially commissioned by Christ to preach the Gospel. Out of the number of his disciples, our Lord selected twelve to be invested with the spostieship. Their names were Simon Peter, and Andrew, James the Greater, John, Philip, Bartholomew, Thomas, Matthew, James the Less, Jude, surnamed Lebbens or Thaddeus, Simon the Canasnite, and Judas lacariot. About eight months after their surnamed Lebbeus or Thaddeus, Simon the Canaanite, and Judas Iscariot. About eight months after their solemn election, and in the third year of our Lord's public ministry, they were sent out by two and two to declare to the people of Israel (not going to the Samaritans or Gentiles) that the kingdom of heaven was at hand, and to confirm their dectrine by miracles. public ministry, they were sent out by two and two to declare to the people of Israel (not going to the Bame, ritans or Gentiles) that the kingdom of heaven was at hand, and to confirm their doctrine by miracles. The eighth book, which relates only to the sacred offices, They were to make no provision for their subsistence and is written for the priests, belongs probably to the 99

on their journey. After the resurrection of our Lord, the place of Judas was supplied by Matthias, and the aposities received a new commission of a more extensive nature,—"To go and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." Paul, and, according to some, Barnabas, were subsequently added to the list of apostles, without regard to the number twelve. After they had exercised their ministry for some years in Palestine, it is said they resolved to disperse themselves to different parts of the world, and determined by lot what parts each should take; but of their travels and subsequent labours we have little reliable information. It was essential to an apostle—1. That he should apostles received a new commission of a more extention. It was essential to an apostle—1. That he should have personally seen Christ; 2. that he should have been immediately called and chosen by Christ himself . B. that he should have been divinely inspired and fully instructed in the mysteries of the kingdom of heaven, so as to be secured against all mistakes in teaching divine truth; secured against all mistakes in teaching divine truth; and 4. that he should have the power of working miracles in attestation of his commission, and of the truth of his doctrine. They were not restricted, like bishops and pastors, to any particular church; and they had no successors in office. The respective badges or attributes with which the several apostles are usually represented are, St. Peter with the keys; St. Paul with a sword; St. Andrew with a cross; St. James the Less with a fuller's pole; St. John with a James the Less with a fuller's pole; St. John with a cup and a winged serpent flying out of it; St. Bartholomew with a knife; St. Philip with a long staff, whose upper end is formed into a cross; St. Thomas with a lance; St. Matthew with a hatchet; St. Matthias with a battle-axe; St. James the Grester with a pigrim's staff and a gourd-bottle; St. Simon with a saw; and St. Jude with a club. St. Paul is semetimes styled, by way of eminence, the Apostle of the Gentiles, as St. Peter was called the Apostle of the Circumcision. The appollation of specific was comptimes given to the appollation of apostle was sometimes given to the ordinary travelling ministers of the Church; as where the apostle Paul speaks of Andromous and Junis as of note among the apostles. According to some, Barna-bas was an apostle in this sense; though others hold that he was one in the highest sense. This was also a that he was one in the highest sense. This was also a title given to those sent by the churches to carry their alms to the poor of other churches. Thus St. Faul, in writing to the Philippians, tells them that Epaphroditus, their apostle, had ministered to his wants. Apostle is also thought by many to have been originally used for bishop before that name was introduced. Among the Jews, it was the name of an officer sent into the different perts of the country to see that the laws were duly observed, and to collect the moneys for the terrula. To like wasture, it is frequently walled. laws were duly concrete, and to collect he moneys for the temple. In like manuer, it is frequently applied to one that has first planted Christianity in a place; as Xavier, the Apostle of the Indies. In the Greek Liturgy, spostle is the name of a book containing the epistles of St. Paul, printed in the order in which they are to be read in churches throughout the course of the year.

APOSILES, ACTS OF. (Scc ACTS OF THE AVOSILES.)
APOSILES CHEED (Lat. credo, I believe), is the
name of a formula of summary of the Christian faith,
drawn up, according to some, by the apostles at Jerusalem shortly after our Lord's ascension; and hence its name. There are many reasons for doubting this; but that it is very sucient is evident from the fact, that it is to be found as it now stands in the works of St. Ambrose and Rulinus, both of whom flourished in the

4th century.

APOSTOLIC, OF APOSTOLICAL, ap-os-tol-ik, is a term. applied to something relating to, connected with, or descended from the apostles; as, the apostolic age, the apostolic doctrine, the apostolic character. The Apostotic Canons are certain rules or laws for the government of the Church, held by some to have been drawn up by of the Church, head by some to have been drawn p by the apostles themselves. There is no sufficient ground for believing that this was the case: they probably be-long to the 4th or 6th century. The Apostolic Constitu-tions consist of eight books; of which the first six con-tain directions for the whole of Christian life, and were middle of the 4th century. There are, however, numerous later interpolations. Apostolic Charches was anciently a name given to those churches which were supposed to have been founded by the apostles. In after-times, other churches assumed this title, principally on account of their supposed conformity with the dootrines of the churches planted by the apostlee. The term Apostolical was first applied to bishops in the 6th century. Afterwards, the title was assumed by the popes of Rome, as being the successors of the chief apostle, Peter. Hence the terms Apostolic Church, Apostolic See, Apostolic Charr, Apostolic Bleesing, &c. Apostolic Fathers is an appellation usually given to the writers of the 1st century, who employed their pens in the cause of Christianity. They were Clement, Barnabas, Ignatins, Polycarp, and Hermas.

Arosporter Succession, ap-os-tol-i-kal, in Theol., is a term applied to the line of unbroken succession in which the ministry of the Church has been continued from the days of the spostles to the present time. "The clergy of the Church of England can trace their

"The clergy of the Church of England can trace their connection with the apostles by links, not one of which is wenting, from the times of St. Paul and St. Peter to our own."—Hook's Church Dictionary.

Arosrolics, or Arosrolici. Ap-os-tol'-iks, in Eccl. Hist., is the name of three different sects, who professed to imitate the manner and practice of the apostles. The first of these, called also Apotactici, or Apotactice, sprang from the Encratices and Cathari, and flourished in the 2nd and 3rd centuries. They professed to have all things in common, to abstain from marriage, and the use of wine, flesh, &c.; but little more is known respecting them. The second sect belongs to the 12th century. They are said to have been free from error in doctrine, and to have been irreproachable and exemplary in their lives and manners. They were peculiar in holding it unlawful to take an oath. in permitting their hair and beards to grow to an enormous length, in proferring celibacy to wedlock (calling themselves the chaste brothers and sisters), and in each themselves the chaste brothers and sisters), and in each man having a spiritual sister, with whom he lived in a domestic relation. The founder of the third sect was Gerhard Segarelli, of Parma, who, in 1260, assumed an apostolic garb, and wont forth as a preacher of repentance; and gradually a number of others joined him. There being nothing startling in their doctrines, they were, for upwards of twenty years, allowed to pursue their course unmolested, and they extended their labours beyond the limits of Italy. At length therapid spread of their doctrines excited the attention of the Church, and Honorius IV., in 1286, issued a bull against them, which was followed four years later by another, by Nicholas IV. Opposition, however, only led them to inveigh more boldly against the errors and corruptions of the Church of Rome, which they described as the Babylon of the Apocalypse. They were now persecuted Babylon of the Apocalypse. They were now persecuted as the state; and many of them perished at the stake; and among others, Segarelli, in 1300. He was succeeded and among others, Segarell, in 1300. He was succeeded by Dolcino, a man much his superior in education and mental qualities. After travelling for some time in Italy, spreading the tenets of his sect, but everywhere dogged by the inquisition, he retired for safety to Dalmalia. After a time he again made his appearance in Italy; but being still an object of persecution, he established himself, with about 2,000 of his adherents, walk and formular the required by the interest of the state of the same of the s male and female, on the mountain Zebello, in the dio-cess of Vercelli. In 1305 a crusade was proclaimed against them, and for two years Dolcino, with consum-nate skill and bravery, defended himself against his enemies, till famine effected what force could not accomplish, and the remnant of famished Apostolics were compelled to surrender. Doleino, after undergoing the most cruel tortures, which he bore with the greatest fortitude, was put to death. In Lombardy and the south of France remnants of the sect existed till 136s. The Apostolics repudiated all rights of property and all inequalities of condition. They were not bound together by any formal vows, nor, by rules, to obedience

and took its name from Samuel Apostool, an eminent minister among the Mennonites.—Ref. Mosheim's Eccle-

minister among the Monnonites.—Ref. Mocheim's Reclesiastical History.

Arosracorra, d-pos'-tro-fe (Gr. apastrophe, a turning away, or breaking off), is the name given to a figure in Rhet., when a speaker breaks off suddenly in the course of his speech, and addresses directly a person absent or dead, or an inanimate object, as if present and listening to him. It is also frequently nued by the poets; and when well minaged, it has a very striking effect; as, "O thou sword of the Lord! how long will it be ere thou be quiet! put thyself up into the scabbard, rest and be still." It denotes strong passion, or emotion.—In Gram., it is used to denote the omission of a letter or letters in a word; as boro' for borough.

The comma employed to mark such omission, or which The comma employed to mark such omission, or which

The comma employed to mark such omission, or which is used in genitives, is termed an apostrophe.

Aporthecantes' Company, "". "poth'-s-kares. — The company of Apothecaries, which is one of the most important guilds of the city of London, was established in the early part of the 17th century. The Apothecaries were first incorporated with the company of Grocera was always. were arst moorporated with the great after, they were separated from the Grocers, and incorporated by a charter granted by King James I., as "The Master, separated from the Grocers, and morporated by a charter granted by King James I., as "The Master, Wardens, and Society of the Art and Mystery of Apothecaries of the City of London." This charter was granted by the king at the advice of his physicians was granted by the king at the advice of his physicians Gideon do Laune, Mayerne, and Akins; and it was enacted that no grocers or others should retail any medicines, without the company's consent, within the city, or seven miles thereof; at the same time, the company obtained full permission to seize all unlicensed drugs. By the statutes of William III. and Anne, "Apothecaries of the city of London are exempted from the offices of constables, scavengers, overseers of the poor, and other parish, ward, and leet offices, and of and from serving upon juries or inquests." Towards the close of the 17th century, the spothecaries of London began to prescribe as well as to dispense medicines, and, by way of retailation, the College of Physicians established a dispensary for the sale of medicines at prime cost. The privileges of the Apothecaries' Company were subsequently greatly enlarged, caries' Company were subsequently greatly enlarged, and the right of members to prescribe in a certain restricted sense was confirmed by an act of parliament, 55 Geo. III. c. 194. (See Chemist and Deuggist.) Apothecaries II all is situated in Union Street, Blackfriers, and is a large plain brick building. Great quantities of pure medicine are prepared at the Hall, and retailed in a shop adjoining, at low prices. The relations between the Apothecaries' Company and the

general body of chemists and druggists are explained in another part of this Dictionary.

APOTHECARIES' WEIGHTS AND MEASURES.—The system of weights used by physiciaus and apothecaries (chemists and druggists) in prescribing and compounding medicines differs materially from that used in general commerce. The term apothecorries weight is usually applied to the one system, and avoirdupois weight to the other. In the London, the Edin-burgh, and the United States pharmacoposiss, every preparation is expressed in apothecaries weight, or, ourgn, and the United States pharmacopesias, every preparation is expressed in apotheoaries' weight, on to adopt a pharmacoutical phrase, this system of weights is officinal. In the Dublin pharmacopesia, avoirdupois weight is employed. There is also a third system, called troy weight, which is used by jowellers, and at the mints, in the exchange of the precious metals. These three systems can be adapted to each other through the series or common unit of weight. other through the grain, or common unit of weight; but the inconvenience attendant on the use of separate sets of weights has long been complained of, and it is sets of weights has long been complished of, and it is to be hoped that one comprehensive system will soon be introduced. It seems very absurd to compel a chemist and druggist to use one set of weights in buying and selling medicines, and another in making up prescriptions. In each system there is a pound and an onnee; but the apothecaries' pound contains 1,240 grains less than the avoirdupois pound, and the apothecaries' ounge contains 424 grains were than the to any superiors; but were united togother by the spirit of brotherly love.—Ref. Krone's Frà Dolcino and die Patarener, Leip. 1844; Neander's Church History; Mosheim's Ecclesiastical History, in Eccl. History.

Mosheim's Ecclesiastical History, in Eccl. Hist., were a sect of Mennonites which sprang up in the year 1664, simple and comprehensive manner, the value of each

denomination in apothecaries' weight, and the relation of these to each other :-

20 grains = 1 scraple = 20 grains.
60 grains = 1 drachm = 3 scruples.
480 grains = 1 ounce = 8 drachms.
5,760 grains = 1 pound = 12 ounces.

Measures of capacity are used for liquids in mixing medicines. The table employed is either wine measure or imperial measure. The minims, as the units of these systems are called, differelightly; that of wine measure being equal to about 95 of a grain of pure water at 60° F., and that of imperial measure being equal to 91 of a grain of the same fluid. In the latter system, which has of late been used in England, the relation between the fluid ounce and the solid avoirdupois ounce is much closer than in the former. The minim a multiplied as follows: is multiplied as follows:-

60 minims = 1 fluid drachm = 60 minims. 480 minims = 1 fluid ounce = 8 fluid drachms. 9,600 minims = 1 pint= 20 fluid ounces. = 8 pints. 76,800 minims = 1 gallon

In prescriptions, the weights and measures are generally expressed by signs or symbols, with Latin numerals affixed. These signs, with the Latin and English words which stand for them, are given be-

m Minim, doth part of a fluid drachm.

gtt Gutta, a drop.

9j Scrupulus, a scrupie.

Drachma, a drachm.

13j Fluid drachma, a measured drachm.

Uncia, an ounce (480 grains).

13) Fluid uncia, a measured ounce.

Ibj Libra, a pound (5,760 grains).

Oj Octarius, a pint.

gr Granum, a grain.

Bemis, half, affixed to any of the above signs. The numerals j, ij, iij, iv, v, &c., show the number of grains, ounces, pounds, &c., to be taken; thus, mix denotes 60 minims, 3vii, 7 drachms, and 3j, 1 ounce.

APOTHECARY and APOTHECARISS ACT. (See CHE-

APOTHECIEY and APOTHECIEIS' ACT. (See CHEMIST AND DRUGGIST.)
APOTHECIA, ap-o-the-shi-a (Gr. apotheke, a repository), in Bot., the term applied to the spore-fruits of licheus. These contain the thecæ, or spore-cases, and occur either as little nodules and raised lines, or as round, shield-shaped, and cup-shaped bodies scattered over the fronds.

APOTHEOSIS, ap-o-the'-o-sis (Gr. apotheosis, a deification), in ancient Myth., is a term applied to the change which a mortal was supposed to undergo when he was raised to a god. Among the ancient Greeks and Romans, there prevailed a belief that certain of their heroes were, after death, raised into the order of their neroes were, after death, raised into the order of the gods; as Hercules, Romulus, Julius Cæsar, &c. In later times the term was more especially used to signify the ceremony by which the Roman emperors were defied after their death. It was in this manner:— A waxen figure representing the dead man was made, A waxen figure representing the dead man was made, and placed on a lofty ivory couch in the vestibule of the palace. For seven days it was regarded as sick, and attended by physicians. When considered dead, it was carried to the old forum, where hymns and songs were sung in praise of the deceased. It was afterwards taken to the Campus Martius, and deposited in a wooden erection four stories in height, and richly adorned with hangings, pictures, gold and ivory images, &c. Fire was applied to the edifice, and while it was supposed to carry the soul of the emperor up to heaven, after which time he was worshipped with the other gods.

APPARENT, "ip-par'-ent (Lat. apparere, to appear), an expression used in Astron. to denote things as they an expression used in Astron. to denote things as they seem to be to an observer, in contradistinction to their actual or real state. The term is applied principally two persons at once, and which was afterwards visible at to diameter, distance, figure, and motion. The apparent diameter of a body is the angle formed by two lines drawn from opposite points in the circumference of its disk to the eye; and the apparent magnitude of a body is similar, being the angle formed by two lines it the appearance of a woman to himself and others in 100

drawn to the eye from its opposite extremities. The apparent diameter and magnitude of bodies vary ac-cording to their distance from the eye. Apparent distance is the distance at which we judge or imagine heavenly bodies to be from us. The appearent distance of the heavenly bodies appears to us to be the same, or nearly so, in all cases, though really so widely different. Apparent figure is the shape which an object presents when viewed under different circumstances. Apparent conjunction is when one heavenly body comes directly in the line between another heavenly body and the eye of an observer. The apparent horizon is the circle which appears to bound the view on all sides, seen most perfectly at sea. Apparent noon at any place is the time when the sun is on the meridian of the place, in contradistinction to true or mean goon, when the sun would be on the meridian if it moved in its apparent orbit with uniform velocity. Apparent motion is that which bodies appear to have to an observer who is himself also moving. The motions of the sun in the heavens are apparent motions.

APPARENT TIME. (See TIME.)

APPARENT, HEIE. (See HEIE APPARENT.)

APPARENT, HEIR. (See HEIR APPARENT.)
APPARITION, &p-pù-rish'-on (Lat. apparere, to apparen.—Phantoms or spectral appearnnees, assuming various forms, in many cases those of departed relatives and friends, which have become visible to the beholder under different circumstances, leading them to believe that they have actually seen the disembodied spirits of those who have been removed from earth. To assert that such visitations are impessible, would be to deny the omnipotence of God; but, in the great majority of recorded cases, it is difficult to assign a sufficient reason for the aunearance of the phantom: majority of recorded cases, it is difficult to assign a sufficient reason for the appearance of the phantom; and a well-regulated mind recoils from the idea that such things would be permitted by the Almighty, unless He wills to work through such agency for some good and beneficent end. While the belief in the possibility of the appearance of apparitions is perfectly justifiable, and may be supported by passages from Holy Writ, for the apparition of Samuel was raised, unexpectedly perhaps, by the Witch of Endor, and recognized by Saul, yet the greater number of stories of spiritual or ghostly appearances that have been related, may be traced to a discased and disordered state of body acting on the brain, through the nerves, exciting certain impressions and sensations in nerves, exciting certain impressions and sensations in a manner so vivid, that those who have experienced these sensations, resulting entirely from an unhealthy state of the system, have beheved, without doubt, that the impressions produced have positively been brought about from the actual vision of those objects which an excited imagination has pictured. Dr. Samuel Hibbert has advanced a theory that these spectral appearances are entirely the result of an abnormal condition of the organism of those who see them, and that they are visible only to those labouring under some temporary derangement of the system, or who have become weakened by illness, or by any means which have caused a reduction of the natural strength of the body, producing a corresponding injury of rational mental power. He substantiates his theory by the case of Nicolai, a bookseller of Berlin, a man of highly imaginative powers, who, after an illness, saw continually whole troops of spectres about him, and even fancied that he heard some of them speak to him. There are, however, many cases, dismissing all those caused by over-indulgence in eating and drinking, fear, and a morbid state of the brain, in which persons same in body and mind, whose veracity cannot sons same in ody sam mind, whose veracity cannot be questioned, have seen apparations, and at such times when it seems but too probable that they should have the power to appear; yet it may be with justice asserted in support of the theory above mentioned, that even in these cases, the truth of which it is so difficult to question, the phantom has been seen by one person only, and may consequently be considered as an illusion of the brain; but how can Dr. Hibbert's

# Appeal

3665. One day visiting a family residing near Launceston, he found father, mother, and son, in a state of the elepest dejection; on inquiry, he discovered that the son asserted that he saw, in a certain field, every day, when crossing it on his way to school, the apparition of a woman. This the parents disbelieved, thinking the attachment to be fabricated by the boy to escape attendance at school. He persevered, however, in declaring his story to be true, and the finister offered to visit the field in which the occurrence was said to take place, in comment with the box be did so, and the anestre in company with the boy; he did so, and the spectre was visible to both; he then persuaded the parents to come to the spot with himself and their son, when the apparition was distinctly seen by these four witness and recognized by the parents as the apparition of a woman who had formerly lived in the neighbourhood, white a dog which had accompanied them, ran away in abject terror. The clergyman, at another time, held some conversation with the spirit, after which it never again appeared; but it is to be regretted that he had arepugnance to record what had passed between them.

Sketches of the Philosophy of Apparitions; English

Cyclopadia—Arts and Sciences.

APPEAL, &p.peel' (Fr. appeler), in Law, is the re-moval of a complaint of an inferior to a superior court, being in the nature of a writ of error. The House of Lords is the superior court of appeal to rectify any injustice or mistake in law committed by the courts The Lord Chancellor has jurisdiction in appeals from the inferior equity judges. The Lords Justices form a court of appeal from the judgments of the master of the rolls, vice-chancellors, and inferior equity tribunals, and commissioners in bankruptcy. chequer Chamber forms a court of error in judgments given by the three courts of common law at West-minster, and is composed of the judges of two of the courts below, not parties to the judgment supposed to be erroneous. The Judicial Committee of the Priny Council sit on appeals from the ecclesiastical courts, the Admiralty, and from the colonies. The full court of Probate hear appeals from the court of the Judge Ordinary. In matters cognizable by justices of the peace, an appeal (unless prohibited by statute) lies to the Quarter Sessions, and now, by 20 & 21 Vict. c. 43, an appeal from their judgments or decisions on points of law may be had to one of the superior courts of law at Westminster. In certain cases in the County Courts appeals are made to a similar tribunal, and in cases of probate entertained therein, to the court of Cases of probate entertained distance of the Probate, whose decision is final. The court of Queen's Bench has jurisdiction over justices of the peace and the court of Quarter Sessions by certiforn; (which see). The court of Common Pleas decides disputed cases before revising barristers on the claims of voters for members of parliament. The archbishop of each pro-vince is the judge of appeals from the archdeacons' and consistory courts.

APPEABANCE, ap-peer'-ane (Lat. appareo, I appear or give attendance). In Law, the term appearance has reference to an ancient state of practice, by which the litigant parties personally, or by their respective attorneys, actually confronted each other in open court. The object is now effected by the party causing a minute or memorandum to be filed in the office of the court, which he may do in person or by his attorney. appear in person, he must state on the minute his address, in order that he may be served with any sub-sequent proceedings. If a writ be served on a defendant, he must cause an appearance to be entered for him within eight days, inclusive of the day of service; otherwise, the plaintiff may sign judgment against him by default. But if the action be brought to recover money on a bill of exchange or promisory note, the defendant is not allowed to enter an appearance unless he obtain leave from a judge within twelve days after the service of the writ, inclusive of the day of service. Leave can only be obtained on an affidavit of facts sufficient to convince the judge that the defendant has a good defence against the whole or part of the claim upon the merits.

upon the merits.

APPELLATIVE, #p-pel'-lā-tio (Lat. appellatio, a naming), in Gram., denotes a common, as distinguished from a proper name. An appellative is applied to a whole class, a proper name only to an individual; thus,

# Apple

city is an appellative, and London, Paris, and Vienna proper names

proper names.
APPENDANT, öp-pen'-dönt (Lat. appendems, hanging, fixing, or fastening to), in Law, is a thing of incorporeal inheritance, belonging to snother inheritance that is more worthy; as an advowson, common, court, or the like, which may be appendent to a manor; common of fishing appendant to a freehold; land appendant to an office; a seat in a church to a house. Ker. Co. Litt. 121.—(See APPURTENANCES.)
APPENDIX, åp-pen'-dix (Lat. ad, to, and pendeo, I hang), is something appended or attached to another, In Lit., it is applied to a supplements notes, or remarks placed at the end of a work! In Anat., it denotes a part attached to, yet in some measure distinct from another.

APPRICEPTION, by per-sep'-shon (Lat. ap, for ad, to, perceptio, perception), is a term applied in Phil. to that state or kind of perception which reflects upon itself, by which we are conscious of our perceptions and can reflect upon the operation of our own minds. The term

was first introduced by Leibnitz.

APPRITE, &p-pe-tite (Lat. appeta, I desire), denotes a desire of enjoying something that is apprehended or felt to be necessary or conducive to happinended or left to be necessary or conducte to hapfiness. In its primary sense, and as used by the Latins, it comprehended every species of desire, whether of a mental or corporeal nature; now, however, it is usually applied only to corporeal desires. According to Dr. Reid, "Every appetite is accompanied with au uneasy sensation proper to it, which is strong or weak in preparation to the desire we have of the chieft uneasy sensation proper to it, which is strong or weak in proportion to the desire we have of the object. Appetites are not constant, but periodical, being sated by their objects for a time, and returning after certain periods. Those that are chiefly observable in man, as well as in most other animals, are hunger, thirst, and lust." Appetites are distinguished from passions in being directed to general objects, while the latter are directed to special objects. Thus we speak of an appetite for fame, glory, or riches. They are also distinguished from passions in the latter having no existence till a proner objected be presented; whereas distinguished from passions in the latter having no existence till a proper objected be presented; whereas the former exists first, and then is directed to an object. Natural appetites are given for the preservation of the individual or the propagation of the species. In a moral point of view, there is neither virtue nor vice in acting from natural appetite; yet there may be much of either in the management of the appetites. Resides the appetites. Besides the appetites which nature has given to us for useful and necessary purposes, we may create others which nature never gave, and which are often very hurtful. Appetites seek their gratification without the aid of reason, and often in spite of it. In common language, the term frequently means hunger.

Appian Way, dp-pi-dn, the oldest and most celebrated of the Roman roads, was commenced by Appius Claudius Cacus, whilst censor, 313 B.C. It formed the great line of communication between Rome and Capus, and was 125 miles in length. In the conand capus, and was 125 miles in length. In the construction of this great highway, hills and solid rock were pierced, hollows filled up, ravines spanned by bridges, swamps covered with embankments, and so stupendous was the whole design, so vast the sums expended upon it, that it became known as the "queen of roads." Large portions of the Appian Way may still be seen at Terracina, and other places, and all those travellers that have described it, concur in praising its excellent workmanship.

ing its excellent workmanship.

APPLAUSE, dp-plauz' (Lat. ad, to, and plaudo, I clap my hands), properly signifies an approbation of something, expressed by clapping the hands. The ancients distinguished it from acclamation, which was expressed by the voice. Among the Romans there were three different kinds of applause; viz., bombus, which was a confused noise, made either by the hands or mouth; and imbrices and leate, made by beating a sort of sounding vessels placed in the theatres for that purpose. Persons were instructed in the art of giving applause, and there were masters for teaching it. Proficients let themselves out for hire to actors and others, and were disposed among the audience, so as to give it with effect. They were divided into chors, and placed opposite to each other, like the choristers in a cathedral.

APPLE, dp'-pel (Ang.-Sax. appl), the fruit of the

## Apple of Love

Pyrus Mahu, a tree belonging to the nat. ord. Rosacea. (See Praus.) All the different kinds of apple-trees now in aultivation are usually regarded as mere varieties of the one species which in its wild state is known as the crabtree. This plant is a native of Britain, and is found in most of the temperate parts of the northern hemisphere. Its fruit is austere and uneatable, but is sometimes collected for the sake of its acid juice. nemisphere. LEXTULE is austere and unestable, out is sometimes collected for the sake of its acid juice, which, when fermented, forms the liquid called veryince, used in cookery and for purifying wax. The cultivated tree was probably introduced into Britain by the Romans, who are said to have had twenty-two varieties. At the present time it is, perhaps, the most widely-diffused and most valuable of all fruit-trees; and the varieties, which are adapted to an trutterers; and the varieties, which are adapted to almost every soil, situation, and climate in the temperate zone, have become extremely numerous. The apple-tree seldom reaches a greater height than thirty feet; but its large round head makes up for the want

of height; and, altogether, it is a noble-looking tree, especially when in full blossom. The flowers grow in

bunches, and are very fra-grant. They are white inside, and delicately tinged

trained as an espalier, or as a wall-tree. New varieties are continually being developed; and, as they are ge-

nerally propagated by grafting, the old ones gradually

die out. The variety that produced the costard, which was formerly a favourite kind of apple, does not exist

at the present time, though we still retain the name AFFLE AND BLOSSOM. of costermongers (costard-mongers) for itinerant sellers of apples. The apple is usually grafted on apple or crab stocks; but sometimes hawthorn stocks are used. For producing dwarf trees, stocks of the paradise apple, a very diminutive variety, are generally employed. The apple (we now allude to the fruit, and paraguse appie, a very unmustry and apple of the apple (we now allude to the fruit, and not to the tree producing it) varies greatly in size, form, and colour. It is regarded by botanists as the type of the kind of fruit to which they have applied the term pome. (See Pome.) The catable part has a more or less aromatic, sweet, or sub-acid taste, and contains starch, grape-sugar, and make acid. Apples are commonly divided into dessert, baking, and cider fruits, the first being highly flavoured, the second such as become soft in baking or boiling, and the third those which are hard and austere. Apples are also classed under the general names of Pippins, Pearmains, Rennets, Calvilles, Russets, Codlins, &c. Large quantities of apples are imported into Eugland from France, Canada, and the Northern States of America. The uses of the apple,—for the dessert, for puddings and pies, for preserving and making jelly, are suffi-ciently well known. Cider the fermented juice of the apple, is a favourite drink in many parts of Ragland and France. Malic acid, extracted from the apple, has long been used in medicine, and has latterly been

has long been used in medicine, and has latterly been largely employed as a mordant in dyeing. (See CIDER, MAILC ACID.)—Ref. For recipes, Mrs. Becton's Book of Household Management.

APPLE OF LOVE. (See TOMATO.)

APPLIBEREY. (See BILLABDIBRA.)

APPLIBMOTH (Curocopa pomonella), one of the most destructive enemies of the apple crop in this country. It lays its eggs in the eyes of the newly-formed fruit, within which the larva feeds. The result is the presenting failing of the apple. is the premature falling of the apple.

APPLES OF SODOM. -A name given to a fruit, of somewhat fabulous properties, growing, or supposed

to grow, "Near that bituminous lake where Sodom stood," Josephus, in describing it, eudows it with many mar. Appraisements made for legacy duty are exempt, but wellous characteristics; such as, that, on the fruit not if made for increase or return of probate duty.

# Appraisement

being plucked with the hands, it is dissolved into smoke and ashes. Hasselquist supposes that the Apples of Sodom are to be found in the fruit of the Solomum Melongeno (Nightshade), which he describes as filled with dust and ashes: he saw it in abundance in the vicinity of the Dead Sea.

APPOGIATURA, op-poj-a-too'-ra (Ital. appogiare, to lean upon), in Mus., a small note which precedes a larger one of greater duration, and which is touched lightly before sounding the principal note. The small note borrows one half, and sometimes only one quarter,

note porrows one nail, and sometimes only one quarter, of the duration of the note preceding it.

Appointment, ap-point-ment (Fr. appointment, from Lat. ad punctum, to a point), in Law, is generally considered as one of the common-law conveyances or modes of disposition, and is a deed, will, or instrument of a derivative nature, relative to or dependent ment of a derivative nature, relative to the expensions on some precedent deed or sastrance, in which a power to appoint to certain uses, or in favour of particular persons, or to divert the property or fund into such channels as the appointer, by the power given, is anthorized or enabled to do. It is also a term used in bankruptcy on the choice of assignees, who are in bankruptcy on the choice of assignees, who are thereupon appointed; and in arbitration cases, on the choice of arbitrators, &c. The term is also applied to an office, employment, or place of profit, which is called an appointment, and to the set of investing with or placing a person in an official employment or emolument, which is called an appointment thereto.

APPOLD'S CRETRIFUGAL PURP. (See PURP.)
APPORTINIMENT, &p-portioner, from Lat. apportioner, from test (Lat. apportioner, from Lat. adportionern, to settle the share, part, or allotment of each), in Law, is a dividing of rent or income into parts, according as

with pink externally. The tree is not always permit-ted to ramify in a natural manner, but is sometimes is a dividing of rent or income into parts, according as the land out of which it issues is divided among two or more; as, if a stranger recovers part of the land, the tenant shall pay, having regard to that recovered and what remains in his hands; but, in general, a rentcharge, or things that are entire, cannot be made the subject of apportionment; and, by 4 & 5 Will IV. c. 22, it is provided that in cases of all fixed periodical payments, payable under any instrument executed when the interest of the recipient determines, by death or otherwise, the payments shall be apportioned so that he or his representatives, and the person entitled by succession or reversion, or in remainder, shall have their respective proportions up to and from the time at which the prior title or interest ceased. does not apply to reat reserved by lease of lands or tenements, as the party liable under the lease is still to make a servent of the children and the lease is still to make a servent of the children as the lease is still to make a servent of the children as the lease is still to make a servent of the children as the to make payment of the whole to the party who would be entitled if the statute had not been made; the latter, however, being liable to account to the person claiming the apportionment.

APPOSITION, Sp-po-sish-on (Lat. ad, to, and pono, I place), denotes literally the set of putting or applying one thing to another. In Gram, two or more substantives are said to be in apposition when they are in the same case, without any copulative conjunction be-

APPRAISEMENT, ap-praiz'-ment (Fr. apprécier, to value, set a price upon).—The act of rating, valuing, or setting a price on estates or effects, or dilapidations or repairs, by a person who is a competent judge, and who, for certain purposes, must be licensed. When a distress is levied for rent, before the goods can be sold to satisfy the distraint, the distrainer must cause them to be appraised or valued by two appraisers, who must be previously sworn by a constable to put a true value on them according to the best of their judgment. In accounting for legacy duty, the commissioners of inland revenue require an inventory and appraisement of goods or property remaining unsold, in order to ascertain the value upon which the duty in respect thereof shall be charged, which inventory is retained by them unless it be stamped. The duty psyable on appraisements is as follows :-

Valuatio	n not exceeding	£50 2 6	
,,	,,	100 6 0	
,	39	200 10 0	
**	If arounding	500 15 0	

APPREHENSION, Appre-her'-show (Lat. ad, to, and grehendo, I seize or lay hold of), literally signifies the taking hold of or grasping with the hand. In Phil, it is applied to that ect of the mind by which it conceives of a thing without passing any indigment upon it. Hence it is used to express an inadequate or imperfect idea of a thing, and is opposed to comprehension. There are many truths which we apprehend, but which we cannot comprehend; as the great markains of the contraction we cannot comprehend; as the great mysteries of our faith. "It belongs to the ides of God that he may be apprehended, but not comprehended by his reasonable creatures." If he were not so, he would not be God, or the being that comprehended him would be God

APPRENTICE, dp-pren'-tis (Fr. apprendre, to learn).— In Las, apprentices are usually bound by indentures for in Law, apprentices are usually bound by insentures for a term of years, with their own consent, without which the transaction is not binding, except in the case of parish apprentices, who may be bound with the consent of two justices till twenty-one years of age. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained. This subject is now placed under the paramount custody of the poor-law commissioners, who have power to introduce new rules from time to time as they may think fit; and provisions are made by which justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures upon reasonable cause shown. Similar powers also belong to the justices in the case of all other apprentices. They may commit them to prison for three months for breach of duty, in cases in which not more than \$25 premium is paid. In usual cases, the terms are arranged between the master and the friends of the apprentice, as to the hours of service and maintenance, and remu-neration of the apprentice. A master cannot legally compel his apprentice to work an unreasonable length of time, to do an unlawful act, or to work on Sunday. The bankruptcy or death of the master is a discharge of the indentures. But by the custom of Loudon, it a master die, the apprentice is bound to continue his services to the widow, provided she carry on the same trade; and by the like custom a freeman may turn over his apprentice to another freeman. If in the indentures there be any covenant by the master or friends of the apprentice for maintenance, the executor or administrator of the deceased party is bound to make provision for the same as far as the assets will allow. A master may administer reasonable corporal chastisement to his apprentice for a breach or neglect of his duty, but he cannot discharge him. It is, however, advisable for the master to apply to the justices rather than take the law into his own hands. He may bring an action against the parent or other person who has by the indenture agreed for the due performance of the stipulations. There is no remedy by action against the apprentice himself, if he be an infant, except by the custom of London. An action lies by the master for enticing away or harbouring his servant or apprentice. An apprentice is not liable to serve his master Thee. An apprentice is not manie to serve in answer after he attains twenty-one years of age; but the master has his remedy over against the party who has covenanted that the apprentice shall serve his time. If the premium be less than £10, and the apprentice absent aimself from his master's service, he is liable to serve havened his team for as long a time as he shall have beyond his term for so long a time as he shall have absented himself, or make satisfaction, or be imprisoned for three unonths; and the renedy is cumulative. The apprentice is entitled to the indenture bearing the stamp-duty chargeable in respect of the premium. It has been lately decided by the court of Queen's Bench that the widow of the master of an apprentice, if executrix and able to teach the apprentice, is entitled to his service.

APPROACH, ap-proche (Fr. opprocher), a term applied to the covered road or treach made by a besieging army to approach the walls of the fortress, without army to approach the walls of the fortress, without being exposed to the enemy's fire. Approaches consist generally of trenches excavated in the ground, the earth being thrown up on the side next to the fortress. Approparion, åp'-pro-bai'-shom, is that act or disposition of the mind by which we assent to a thing with some degree of pleasure or actisfaction. Moralists are

divided as to the motive which determines us to approve

or disapprove. According to some, it is self-interest; according to others, sympathy. According to Dr. Reid, it includes "not only a moral judgment of the action, but some affection favourable or unfavourable towards the agent, and some feeling in ourselves." In some cases the feeling predominates; in others the judgment is more prominent.

is more prominent.

APPROPRIATION, the pro'-pri-ab'-show (Lat. appropriatio, applying or taking to one's own use).—In Law, a parson has, during his life, the freshold, in himself, of the parsonge-house, the glebe, the tithe reut-charge, and other dues; but these are sometimes appropriated; appropriation, therefore, signifies the perpotual annexing of a benefice to some spiritual corporation, either sole or aggregate, being the putron of the living or heareflee.

APPROVER, dp-proof-per (Lat. probator, prover), is a person who, indicted of treason or felony, and arraigned for the same, confesses the fact before ples pleaded, and appeals, or accuses his accomplices of the same crime, an order to obtain his pardon. He has to take an oath to reveal all treasons and felonies that he knows of. to reveal all treasons and felonies that he knows of. The accomplice, or appelles, is equally bound to answer it; and if he has no reasonable and legal exceptions to make to the person of the approver, he must be tried, and, if found guilty, suffer judgment, and the approver shall have his pardon at debit justities. If the appelles be acquitted, the approver receives judgment for the crime confessed, the condition of his pardon having failed; viz., the convicting some other person. The doctrine of approvement has fallen into desuctude, and the object is attained by admitting one accomplice as a witness for the crown, or, as it is commonly called, queen's evidence against the others. (See EVIDENCE.) Bailiffs of lords, in their franchises, are called their approvers; and in the statute | Edw. III. c. 8, sheriffs are called the king's approvers.

APPROXIMATION, &p-prox'-mail-shon (Lat. ad, to,

APPROXIMATION, ap-prox't-mail-shon (Lat. ad, to, roximus, vext), in Arith, and Alg., the coming nearer and nearer to a root or other quantity sought, without finding, or expecting to be ever able to find it exactly, the operation employed to discover a quantity that can-not be positively determined. It is most frequently used to find the bi-quadrate and cube roots of numbers that would leave a remainder when the nearest bi-quadrate or cube root was found. By approximation the value of a quantity may be found, if not to the utmost degree of exactness, sufficiently so for practice; thus:—  $\sqrt{2} = 1.41421356$ , &c. = the approximating series  $1 + \frac{1}{160} + \frac{1}{1600} +$ 4x-3+2x-4+, &c.

APPUI, ""p.pue" (Fr., support, prop), in Mil., a term applied to any particular point or body upon which troops are formed, or by which they are marched either

troops are tormed, or by which they are marched either in column or line. This is termed the point d'appui. Appurtenances, dp-pur-te-nân-see (Lat. pertineutiu; Fr. appartenir, to belong to), in Law, are things, both corporeal and incorporeal, appertaining to another thing as principal; as, hamlets to a chief manor; and common of pasture, piscary, &c.; also liberties and services of tenants, and outhouses, yards, orchards, and gardens, are appurtenant to a house or messuage. (See Appendant) (See APPENDANT.)

(Oce APPENDARY.)

APRICOT, al'-pri-kot (Lat. præcoz, blossoming early),
the popular name for Prunse Armenioca, a fruit-tree
belonging to the same gen, as the plum. It is a native the popular name for Prunus Armssiaca, a fruit-tree belonging to the same gen, as the plum. It is a native of Armenia and the countries eastward, to China and Japan. It blossoms at the very commencement of spring, and bears a fruit resembling the peach, but with yellow fiesh. It appears, from Turner's "Herbal," that the apricot was cultivated in Britain in 1562; and in Hakluyt's "Remembranes", 1852, it is affirmed that it was first brought here from Italy, by Wolfe, a French priest, gardener to Henry TIII. Upwards of twenty varieties are now in sultivation. The trees are generally budded on plum stocks and trained against walls. The dried fruits are exported from Italy and the south of France. and the south of France.

Arran, ai-pril (Int. Aprills, from aperio, I open), is the fourth month of our year, and was so called from the earth beginning at this time to open her bosom for the production of fruits. It contains thirty days.

## A priori.

A raiser, pri-or'-i, is a term in Logic, taken from the Latin, and signifying, literally, 'from a thing before,' as opposed to a posteriori, 'from a thing after.' They distinguish the two different methods of reasoning, the former being applied to arguments from cause to effect, the latter from effect to cause: the one lays down some previous self-evident principles, and then descends to the several consequences that may be deduced from them; the other begins by regarding the phenomena themselves, traces them to their original, and, by developing the properties of these phenomena, arrives at the knowledge of the cause. In modern times, the term à priori has come to be extended to any abstract reasoning from a given notion to the conditions which such a notion involved; as, for example, the title à priori bestowed on arguments for the existditions which such a notion involved; as, for example, the title d priori bestowed on arguments for the existence of deity, drawn from the phenomens that we observe around us: thus, Clarke's à priori reasoning for the existence of God is, properly, an argument à posteriori. Kant applies the term à priori to knowledge which is absolutely independent of all experience, as opposed to empirical knowledge, or knowledge derived à protection; through experience, In this same as opposed to empirical knowledge, or knowledge derived à posteriori, through experience. In this sense, the terms are now commonly used by philosophers. "If there are any truths which the mind possesses, whether consciously of unconsciously, before and independent of experience, they may be called à priori truths, as belonging to it prior to all that it acquires from the world around. On the other hand, truths which are acquired from observation and experience, are called à posteriori truths, because they come to the mind after it has become acquainted with external facts. How far à priori truths or ideas are possible, is the great compus philosophorum, the great controverted question of mental philosophy."—Thomson's Lawe of Thought.

Arenders, devisites (Gr. apsis, arch, connection),

APRIDE, dp'si-dees (Gr. apsis, arch, connection), the points in the orbit of a planet, or any heavenly body, at which it is at its least and greatest distance from the sun or body round which it revolves as a centre. from the sun or body round which it revolves as a centre. The appaies of a planet are its aphelion and perihelion, and those of the moon its apogee and perigee. The diameter of the planet's orbit, which joins these extreme and opposite points, passing through the centre of the same,—the sun in the case of the planets, and the earth with reference to the moon,—is called the line of appsides or apsea. This line always forms the greater axis of the ellipse in the path of which any planet revolves. (See APHELION, PERIHELION, APOCAR PERINGEN.) planet revolves. GRE, PERIGRE.)

APPEAL, &p-te-rat (Gr. a, without; pteron, a wing), in Arch., a term used particularly with reference to the temples of the ancient Greeks and Romans. It is applied to buildings which have no lateral columns, is applied to buildings which have no lateral columns, but may have portices of columns projecting from their ends. The Greek temples were, for the most part, peripteral, as the parallelogrammic temples of the Romans were generally apteral prostyles. The latter style has been most frequently adopted in modern edifices.

APTEREX, apt-to-rix (Gr. a, without; pterux, wing),

APIERYI.

## Aquarium

perhaps, more nearly to the extinct dode. It has a long spike-like bill, of which it makes use in supporting itself when at rest. Its wings are simple radiments,—a mere sump, terminated by a hook. Its feathers fall loosely, like those of the smu. Only one species is known, about the size of a goose, a native of New Zealand. The name kins-kive is given it by the natives, who use its skin in making clothing.

AQUANORITS, ai'-qui-for'-kii (literally, strong water), the common name for the impure nitric acid of com-

AQUAGE, di'-kwaj (Lat. aquagium, from aqua, water), a water-course.

AQUAMARINE, or BERYL, ai-qua-ma-reer', a precious stone, of a greenish-blue tinge, much valued as a jewel, from its lovely colour and great hardness. It is cometimes yellowish, and occasionally almost colouriess. Its finest crystals come from Brazil and Siberia. The opaque aquamarine is greenish or yellowish white, and is found in North America, in prisms four feet long, their planes being five inches in breadth. At Limoges, in France, they also occur of great size. The beryl is closely allied to the emerald, both being double silicates

closely allied to the emerald, both being double ellicates of alumina and glucina, and differing only in their colouring matter, which is oxide of iron in the beryl, and oxide of chromium in the emerald.

AQUA KRGIA, ai\*.kwa re\*-ji-ā (Lat., royal water), in Chem., a substance, called, from its property of dissolving gold, the royal metal; the commercial name for nitro-hydrochloric acid. It is made by mixing one part of nitric acid with two or three parts of hydrochloric acid. The acids decompose each other, chlorine and nitrons acid being liberated, the former of which attacks the acid or other netal acted mon. forming sublocks the gold or other metal acted upon, forming a chloride. It is much used by chemists, as a solvent for gold, platinum, iridium, osmium, and other metals.

AQUARITM, ai-quair-i-um, a vessel containing water, either salt or fresh, in which living specimens of aquatic animals and plants are maintained in a healthy state. The words vivarium and aquavivarium have been employed by certain writers to denote the same been employed by certain writers to denote the same thing. Aquaria, both fresh-water and marine, have become exceedingly common, and numerous works have been written on their management. As many of these treatises are utterly untrustworthy, having been compiled in haste, by men knowing little or nothing of the habits of the creatures adapted for squarta, a few practical directions for stocking and keeping up these pleasing and instructive arrangements will doubtless be acceptable to many readers of this work. Before entering into practical details, we will briefly sketch the history of the aquarium, and describe the principles upon which it depends. To Mr. Warrington must be gwarded the thanks of all leaves of the state must be awarded the thanks of all lovers of nature, for having first produced a perfect aquarium. In 1850 this gentleman communicated to the Chemical Society the result of a year's experiments " On the adjustment the result of a year's experiments. On the adjustment of the relations between the animal and vegetable kingdoms by which the vital functions of both are permanently maintained." To illustrate this adjustment, Mr. Warrington kept for many months, in a vase of unchanged water, two small gold-fish and a plant of Valiencies spiralis; and afterwards he made a similar experiment with sea-water, weeds, and anemones, which was equally successful. Before this, several attempts had been made to preserve fresh water and marine organisms by naturalists. Mr. Ward, whose ingenious discovery of the method of growing ferns and other delicate plants in closed cases (see Wardian CARE) had already earned for him a world-wide repu-tation, stated, as early as June, 1849, at a meeting of the British Association, that he had succeeded of the British Association, that he had succeeded not only in growing sea-weeds in sea-water, but in sea-water artificially made. Seven years earlier, Dr. Johnston succeeded in preserving the delicate pink coralline in a living state for eight weeks, in unchanged sea-water. The list of workers in the aquarium cause would be incomplete without the name of Mrs. Thynne, a lady living in London, who frequently surprised the scientific societies by exhibiting beautiful specimens of rare marine animals which she had kept for many months. having mersly adorated the simple for many months, having mersly adopted the simple expedient of serating the sea-water, by pouring it from one vessel into another. Before Mr. Warrington one vessel into another. Before Mr. Warrington s gen, of birds allied to the ostrich and omu, and, published his paper, Dr. Lankester had kept sticklo-

# Aquerium

backs, gold-fish, and other fresh-water saimals, in jars containing growing sparies of Valueria. It closes, the well-known marine scolegies, also abouted in the same field, and his efforts to demesticate his favourity sea-anomous were tolestify successful. The fact of his being ignorest of Mr. Warrington's experiments proves that science had already smoothed he way to the discovery of this healthy contrinces my minversally known as the squarium, by the aid of which the naturalist, sitting in his parlour or conservatory may study the natural habits of the strange and interesting inhabitants of the deep.

The great principle involved in the aquarium is the constant interchange of elements between the animal and vegetable kingdoms. (See Animal Kingdom). Water has the power of absorbing certain quantities of atmospheric air and other gases. In every natural water, whether fresh or salt, we find a proportion of carbonic acid, which is a compound formed of oxygen and carbon. The leaves of plants, when acted upon by light, decompose this gas, and, having no necessity for oxygen, they merely absorb the carbon. Animals, on the other hand, require oxygen, for the purpose of removing the waste carbon of their bodies; and the process of respiration causes the two elements to combine in the form of carbonic acid. The vegetable world is therefore continually absorbing carbon, while the animal world is giving it of; and a balance is thus world is therefore continually absorbing carbon, while the animal world is giving it off; and a balance is thus preserved between the two great divisions of organized beings. The other elements which enter into the composition of animal and vegetable structures circulate in a more obscure manner, but with equal regularity. A vessel containing a supply of aquatic plants and animals must be looked upon as a little world, in which the interchange of elements represents those sast phenomens that preserve the halance of life in the great world; the few water-weeds take the place of the vast forests, the green prairies, and the dense jungles; and the gold-fish, minnows, newts, and snalls, stand for the earth's fauna. To form an aquarium, we have merely to imitate nature. A good supply of plants must be planted, to decompose the poisonous carbonic acid gas, and keep up a continuous supply of the vivilying oxygen; while particular care must be taken not to overcrowd the tank with animals.

The vessels used for aquaria are constructed, either late in a more obscure manner, but with equal regu-

taken not to overcrowd the tank with animals.

The vessels used for aquaria are constructed, either wholly or partly, of glass: a common propagating-glass, such as is used by gardeners, is often employed. These glasses can now be obtained, fitted with proper etands, and manufactured from a clearer kind of glass than formerly. Glass tanks, of a restangular form, are, however, preferable to vases, as they do not distort the objects seen through their sides, and are less liable to breakage. The glass rase is extremely fragile, and an unlucky blow ruins it at once, and, perhaps, destroys the labour of many weeks; whereas, a cracked side in a rectangular tank can be easily replaced. The most perfect form of tank is that invented by Mr. W. Alford Lloyd, and known as the "slope-back tank." One side only of this tank is formed of glass, the other three being composed of slate. The back slopes downwards, from the source of illumination to

## Aquarium

rilant, but it must be frequently thinned, as it grows extinemely fast. The different species of Duckweed (Longeton) state II ha different species of Duckweed (Longeton) are all applicable to the purposes of the aquaritim maturalist. He entire the state of the summats should be introduced into the tank until the plants have been established sufficiently long (say three or four days) to properly alreas the water. Of the animals satted for the fresh water tank, flahes rank flats. All the different kinds of Carp, including the gold-fish, are easily domesticated. The Teach, the Miller's thinnsh, the Minnow, the Stickeback, and the Grig Rei, are also suitable fish. The interesting class of Batrachia are generally represented by the common frog, the smooth next, and the created priton. Small water-tortoises and salamanders have lately been imported for aquaria. Some members of the class Molleco are absolutely indispussable in a fresh-water aquarium, as they act as scavengers, and carefully remove the green flux which fours upon the glass, and which, in their absence, would soon obscure the contents of the tank. The best mollasks are the pretty coil shells (Planorbic corners and contents), the marchcontents of the tank. The nest molecuse are the pretty coil-shells (Planobic correirs and opinions), the marsh-shell (Paladina viotpara), and the cared mud-shell (Linnea auricularis). It is doubtful whether insects ought to be admitted into aquaris which are intended merely for parlour ornsments; but the asturalist ought not to consider his tank complete unless the ought not to consider his tank complete unless the important class of insects is properly represented. Considerable care, however, must be bestowed on the selection, as some of the members of the bestle tribe are so bloodthirsty that they will even venture to attack the smaller fish. Some writers on the aquarism recommend artificial accation; but when the balance of vegetable and animal life is properly adjusted, there is no necessity for resorting to any extraordinary means to insure a company summly of overess.

is no necessity for resorting to any extraordinary means to insure a copious supply of oxygen.

The Marine Aquarium affords us the means of observing some of the most curious forms of animal life. The tank is filled with sea-metar, which should be conveyed to its destination in clean stone jars, or in casks perfactly seasoned. When real sea-water cannot be got at (though this emergency must now be a very rare one), artificial sea-water may be used, after having marine plants in it. Mr. Gosse has given the following simple formula for the preparation of this artificial sea-water: sea-water :-

Epsom salts founce.
Chloride of magnesium 200 grains troy.
Chloride of potassium 40

nnese materials are to be added to a little less than four quarts of water. The specific gravity of the solution, when properly prepared, will be found to be 1026. The green and red sea-weeds are the plants used, the dark-coloured weeds being inapplicable for aquarium purposes. (See Alex.) The animals which form the glory of the marine tank are the sea-enemones These materials are to be added to a little less than form the glory of the marine tank are the sea-enemones (see Arkmoxes) and madrepores. Besides these, the star-fishes, the sea-urchins, the barnedes, and the beautiful plumed worms called serpulse and sabelle, generally gain admission. The grab family famish the humorous element in the squarium; and it is impossible to observe the clumsy antics of some of them, particularly the hermits, with a serious countenance. tank." One side only of this tank is formed of glass, the other three being composed of slate. The back slopes downwards, from the source of illumination to the lower edge of the glass front, an arrangement which enables objects to be seen in a slanting light, which exhibits their form and colour to the greatest advantage. Whatever kind of tank is used, it should be provided with a cover of sheet-glass, to keep out dust, and to prevent the more advanturous creatures making their escape. A layer of well-washed single of sand is laid at the bottom of the aquarium, and in this the roots of such plants as are provided with these creatures in this the roots of such plants as are provided with these creating their escape. A favor of well-washed single of sand is laid at the bottom of the aquarium, and in this the roots of such plants as are provided with these creating their escapes. A favor of well-washed single of sand is laid at the bottom of the aquarium, and in this the roots of such plants as are provided with these creating upon the shingle, look much better than any isolostic minarets of sham reckwork, formed of cement, and afford sufficient shelter for all animals of a retaining disposition."

The fresh-water aquarium is filled with ordinary river or spring water, and serves to exhibit the animals and plants found in ponds and ditches. The best and most lasting plant is the spiral Valineria (Valineria spiral valineria (Valineria spiral valineria), which is a fine grassy-looking weed, having the creation and the cocan. The prevaluation was the rising and falling place in the occan. The prevaluation was to constantly falling place in the occan. The water, and consequently water to drip into it from a constantly of water to drip into it from a sensitive side to despute the constantly falling place in the occan. The water, and consequently water to drip into it from a constantly of water to drip into it from a considerable height; but

me hand, she present a more to an present my temporad upon for them of distillic crokes, the lower routinings the grand arches, and the upon district. The length of this arcade is 500 feet, the breadth AA, and the height 420. The account of Cassets, built in 1733 by Oharles 1111. of Naries, is also a giganisorizatione, the of its arcades consisting of these time of arches, 1/24 feet long and 190 feet in heaths. In France the aquednot which brings water to Moutpeller, perhaps, the most beautiful. It required thirteen years for its completion. The primapal access is 90 feet high, and consists of two times the toward containing 90, and the upper 210 arches. That of discussideserves next to be noticed. It was originally built by the emperor Julian, A.n. 360, to bring water to Faris, and supplied the palace and hot balls, but was destroyed by the Normans. After being in disage for 500 years, it was rebuilt in 1834; again separated in 1777; and fresh sums have lately been devoted to the same purpose by the city of Paris. The accordances the valley of Arcueil consists of 35 arches, is 75 feet high, and 1,200 feet in length. "The first squeenic bridges for causals in this country were those mode by high, and 1,200 feet in length. The first emediant-bridges for canals in this country were those made by the duke of Bridgewater under the direction of the celebrated Brindley, and which, being quite new, extend no small degree of astonisiment. The first and largest was the aqueduct at Barton Eridge, for conveying the canal across the Irwell, 30 feet shows the surface of the water. The Pont Dysylts equadout of Telford is justly celebrated for its magnitude, for the simplicity of the design, and the skillful disposition of the parts, combining lightness with strength in a degree seldom attempted. This aqueduct serves to convey the waters of the Ellesinere Canal across the Decand the Vale of Llangellen, which it traverses. The channel for the water is made of cast-iron, supported on cast-iron ribe of arches, and these resting on pillars, of stone. The whole length of the aquednet is about 1,000 feet, and consists of 10 arches, seek 45 feet span. of stone. The whole length of the aquedint is about 1,000 feet, and consists of 10 archet, each 45 feet span. The breadth of the pillars at the top is 8 feet, and the height of the four middle ones is 115 feet to the springing. The pillars have a slight taper, the breadth of the middle ones at the base being 15 feet. The wight from the surface of the water in the Dec to that in the canal was to be 126 feet 8 inches." (Pop. Encyclopedia.) At fig. 1, Plate VII., we give a drawing of this elegant structure. The remains of the aquedion at Nismas. in Provence, in excellent presentation, fursation. elegant structure. The remains of the aqueduce at Nismes, in Provence, in excellent preservation, furnish the best example of this class of ancient engineering works. It consists of three rows of arches raised one above another, each smaller than the one below it; the lowest of 6 arches, the centre tier of 11, and the uppermost of 35. The Pont du Gard, which crosses the valley of the Gardon, is 188 feet in height, the length of the highest arcade being 973 feet. It corresponds to the water of Hure to Nismes, and was carelland by the Romans in the reign of Augustus. At the 12-Plate VII., we have given a drawing of this colorator work. The Croton aqueduct convays scalar from the Croton river to New York, over a distance of 38-miles. miles.

AQUEOUS HUMOUR, at queous, in anat. Is the name given to that watery fluid of the eye which is simulated between the back of the cornes and the front of the AQUEOUS HUMOUR, al-que lens. (See Ern.)

for religion, and gave them a constitution at once religions and military. In eighty years after his death, his followers had extended their power from Egypt we the Indies, and from Labous to Sumarrand. Contact with more civilised actions to Sumarrand. Contact and sciences began to Succeed these was featured at the splendid court of Airmansar, at Ragded (754-75); but it was Haroum at Raschid (766-608) that infused into his people on enduring force for them. He invited learned men from all parts to his kingdom, and munificently rewarded them. He existed translations to be made of the most estebrated works in Greek, Syrisc, and other languages, and circulated them by numerous copies. The calpid Al-Mannu (613-33) offered to the Greek supercor five tom of gold and a perpetual treaty of peace if he weakle such the philosopher Lee for a time to instruct him. Under his reign, excellent schools and large libraries, at Bagded, Alexandria, and other piaces, were established. But while the dynasty of the Abassides were fostering learning at Bagded, that of the Ommarades were similarly engued at Cordova, in Spain, which, particularly in the IOth qualury, was the chief seat of learning in Europe Students came from France and other parts of Europe to study, especially mathematics and medicine, at Cordova. Besides the docustional institutions at Cordova, the Arabs had established fourteen academies and numerous elementary and middle schools throughout the country. At a time when learning found and numerous elementary and middle schools throughout the country. At a time when learning found and numerous elementary and middle schools throughout the country. At a time when learning found scarcely any support or encouragement anywhere else, the Araba were collecting and diffusing it to all parts of the world; indeed, the progress of the Araba in learning is scarcely less remarkable than their success in conquest. In geography, history, mathematics, medicine, and physics, they have rendered important services, and many of their words are still to be found in the physical and mathematical sciences; as, algebra, sicohol, almenae, animuth, zenith, nadir, &c. Geography is not a little indebted to the labours of the Araba; they considerably extended the boundaries of the then known world by their expeditions of discovery; while the geographical treatiess of Abulfeda, Edrisi, and others, are still interesting and valuable. After the 5th centary, history came to be a favourite subject of study with them. Among their works of this class are the inversal histories of Masudi Tabari, Eutychins, the Christians Abulfara; and Elmakin, and Abulfeda, Fursiri, Soyuti, &c. Upon the history of the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain there are numerous works in the Araba in Spain the Araba in Spain the Ommanded Araba in the Araba in the Araba in the Araba in dynasty, which, with the introduction of the works of Aristotle, led to the formation of various sects of believers. The most celebrated exegeses of the Koran are by Samathshari and Baidhawi. Their philosophy believers. The most celebrated exegeses of the Koran are by Samakhahari and Baidhawi. Their philosophers was related to the Koran in the same way that the scholasticism of the Middle Ages was to the Scriptures. It was of Greek origin, and was drawn chiefly from the works of Aristotle. Among their most distinguished philosophers were Avicenna and Averroes, both of whom have written commentaries upon Aristotle. Many of the Aristotle highlosophers were also physicians, and they made considerable advances in chemistry, botany, and the knowledge of diseases. Anatomy, however, made no progress with them, as dissections, and the knowledge of diseases. Anatomy, however, made no progress with them, as dissections are groundliked by the Koran. Schools of philosopher arises and Averroes have both written able works upon medicine. On natural history wrote Daniri, Ibn-Baitar, and Kaswini. In mathematics the Arabe made great advances. In arithmetic they introduced the numerals now in use and decimals; and in trigonometry they adopted sines intecad of chords. They simplified the trigonometry they adopted sines intecad of chords. They simplified the trigonometry they adopted sines intecad of chords. They simplified the trigonometry and the first of the discount of the Greeks, and extended the application of algebra. Astronomy was aggerly studied, so which had not a country and famous schools and observatories, at Bugdad, they had famous schools and observatories, at Bugdad, wood land, common, and water, —as it

state. As their military glory departed, so seems also
to have passed away their intellectual enthers. Bow
they are sunk in stupid indolence, and have no literature worthy of notice,—Ref. Brookhaus Concernations—
Lexiton.

ABABIAN NIGHTS' ENTERTAINMENTS, & Woll-known and very popular collection of eastern tales, first made known to Europe by Antony Galland, a French orientalist, under the title of "Les Mille et Une Nuits" (The Thousand and One Nights), 12 vols., Paris, 1704. The work speedily became popular, and was translated into all the European tongues. Improved and more complets editions have since appeared. The best English translation is that by Edward William Lane, which was published in 1839. These tales had long existed in the East before they became known to Europeans: they are supposed to be of Persian origin. Persian tales began to be translated into-Arabic about the 8th century, and probably, soon after this time, many of the tales may have been collected, this time, many of the takes may have oeen concered, though they were doubtless subsequently added to and improved. The great popularity of the work in Europe is to be accounted for from the great simplicity and rigour of its style, and the powerfully-drawn sensuous pictures with which it abounds,—its gilded palaces, pictures with which it abounds,—its gilded palaces, charming women, lovely gardens, and exquisite repasts; while the fearless courage of the Arab knight, his love of adventure, his dexterity and skill, his love and revenge, the craft of the women, the hypocrisy of the priests, and the vensity of the pidges, are all powerfully delineated. The story that forms the union of the tales is, that the Sultan Schahriag, exaperated by the faithlessness of his bride, made a law that every one of his future wives should he put to death the morning after marriage. At leagth, Sheherazade, the daughter of the grand vizier, by the charm of her stories induced the sultan to defer her execution from day to day, till a thousand and one nights had passed day to day, till a thousand and one nights had passed away. By this time, Sheherazade was the mother of three children, whom she led before the throne of her husband, and so induced him to spare her life.

Arabio, Gum. (See Guns.)

Arabio, divide to see which sprang up in Arabia about the year 207, who held that the soul died with about the year 207, who held that the soul died with the body, and also rose again with it. Origen is said to have refuted their error, and prevailed upon them to abandon it. It originated in an opinion teen held by many in the early oburch; that the soul of man was material. There were some revivals of this doctrine

furnishes, with due care in its management, abundant furnishes, with due care in its management, abundant cereal crops, roots, and vegetables for the sustemance of man and animals. An account of the various series of soil, with their respective natures and properties, together with information as to the best method of preparing and improving the land, and the rotation of crops most advantageous to the farmer, will be treated elsewhere (see Borts, Cultivation of Soil, Rotation of Choos, Marues, Thilads, &c.); notices of the most important agricultural implements will also be found under their respective headings. (See Plough, Harrow Scapture, &c.) The principal component heround under their respectivenessings. (See FLOUGH, HABROW, SCRISTIER, &c.) The principal component parts of all soils are earths, chiefly clay, sand, and lime, mingled in various proportions; the oxides of metals, especially the protoxide and perfixide of iron, the former giving a black and the latter a red colour to the land; saling substances as potach sade &c. the primer gyning a black and the latter a red colour to the land; saline substances, as potash, soda, &c.; decayed animal and vegetable matter, and water.

ANACEE, d-rai'se-e, in Bot., the Arads or Arum family, a nat. ord. of monocotyledonous plants, in the

sub-class Petaloides,-herbs or shrubs with acrid juices and subterranean tubers, corms, or rhizomes. Their leaves are sheathing, usually net-veined and simple, but in rare instances compound. Their flowers are monoccious (male and female organs in separate flowers), and they are arranged on a spadix within a spathe. The order embraces 30 genera and 170 species. spathe. The order embraces 30 genera and 170 species. The Arada abound in tropical countries, and some few occur in cold and temperate regions. They are all more or less acrid, and often highly poisonous. The type of the order is the genus Arum (which see).

ARACHIS, ar-i-kis, in Bot., a gen. of plants belonging to the nat. ord. Leguminous, sub-ord. Papilionaece.

The species A. hypogæa, a native of the tropical portion of America, is remarkable for ripening its legumes under the surface of the ground, which characteristic is indicated by the names underground kidney-bean and ground-nut, commonly given to it. After flowering, the flower-stalks elongate and bend towards the earth, into which the pode penetrate. Each pod contains two, three, or four seeds, which, when ripe, are about the size of hazel-nuts. These seeds are used as food in various parts of the world; for the plant is now cutting. vated in Africa, Asia, and certain portions of Europe, as well as in its native regions. On being subjected to pressure, these seeds yield a fixed oil, which is extensively employed for cooking in India, where it is called katching oil. Being a very liquid oil, it has been used in this country for watches, and other delicate machi-

nery, as well as for harning, and other quicete machinery, as well as for harning, and other purposes.

ARACHNOID, a-rik-noid (Gr. arachnoides, from arachne, a spider, and eidos, form or ligeness), literally signifies colved-like. In Anat., the arachnoid membrane is the name of one of the three membranes which envelop the brain and spinsl cord. It is situate between the dura and the pia mater, and is a thin glisten-ing membrane. The tissue of the virtreous humour of eye has also this name.

ARROSTURE air-re-o-stile (Gr. araios, wide, and studes, a column), a term in Arch., used by Virtruvius to indicate one of his five species of Grecian and Roman temples. It refers to the distance at which the columns of a portion or colonnade should be placed apart, which should be from four to five times the diameter of the columns. Thus, if the columns be a foot in diameter, the distance between them should be from four to five feet. This proportion of intercolumniation is assigned more particularly to the Tuscan order of architecture.

more particularly to the Tuscan order of architecture. Arrostrythe, airre-o-sis'-tile (Gr. arcios, wide, sun, together, and stutos, a column), applied in Arch. to the proportioning of the space between columns arranged in pairs, with a wide interval between each pair. The columns at the western entrance to St. Paul's Cathedral are arranged in this manuer.

ARALIA, i-rai-had, in Bot., a gen. of plants belonging to the nat. ord. Archiaces. It contains a considerable number of species wires.

longing to the nat. ord. Arabicova. It contains a considerable number of species,—trees, shrubs, and inches, some of which yield useful products. gam-resins.

Arkitaus, arail-iai-es-e, in Bet., Ivy-worts, a nat. ord. of disotyledonous plants, in the sub-class Calgorifora,—trees, shrubs, or herbs closely allied to the unbelliferous plants, but not possessing, in the slightest degree, the poisonous properties so commonly found in those plants. There are 21 geners and 160 species, which are universally distributed; being found in tropical, sub-tropical, temperate, and the coldest regions. The most interesting genera are described under their respective botanical names. (See Aralia, Hedra, Jun, 2007, Arangam, 2007, A

HEDERA, IVE, PANAX.)

ARAMARN, or ARAMAIC LANGUAGE, dr-a-me-ies, the language of the country of Aram, a name literally signifying 'high land,' as distinguished from Canaan, or 'low land,' and applied to that district of country which comprised Syris, Bebylonia, and Mesopotamis. The Aramaic belongs to the Semitic class of languages, and is divided into two principal dialects,—the Western Aramaic or Syriso, and the Bastern Aramaic or Babylonian. There are also, as minor dialects the Samavitan Aramac or syrac, and the Lesseen Aramac or Lacy-lonian. There are also, as minor dialects, the Samaritan and Palmyrene. The Aramaean language is peculiarly interesting, as having been generally apoken by the inhabitants of Palectine, from the Babyloman captivity. to the final dispersion of the Jews. As a spoken language, it now exists only in some remote valleys of the mountains of Kurdistan: The Aramaci is generally the harshest, poorest, and least cultivated of the Semitic languages.

Semitic languages.

ARAUCARIA, ā-raw-kair'ā-ā, in Bot., a gen. of plants belonging to the nat. ord. Pinacea, or Conifera, the Pines, consisting of gigantic trees, natives of the southern hemisphere, and distinguished by having the male and female flowers on separate plants. The species are all evergreen, and their leaves are considerably broader than those of the ordinary pines and firs. A. receisa, commonly called the Norfolk-Island pine, is a post majestic tree, crowing to a height of firs. A exceta, commonly called the Norfolk-Island pine, is a most majestic tree, growing to a height of from 160 to 220 feet, and having sometimes a circumference of more than 30 feet. Its timber is white, close-grained, but remarkably heavy, and seldom sound for a great length: the bark abounds in turpentine. This tree occurs in Norfolk Island, New Caledonia, and some parts of Australia. A imbricate, the Chili pine, has been introduced into this country as an ornamental tree, and is now frequently planted as an ornamental tree, and is now frequently planted on lawns and in shrubberies. Its seeds are edible, and are extensively used for food by the natives of Chili and Patagonia. It is said that the fruit of one large tree will maintain eighteen persons for a whole year.

will maintain eighteen persons for a whole year. This tree was first found growing on the mountains of the Araucanian Indians, in South America; whence the name of the genus. A. Bidwillis, found at Moreton Bay, has also edible seeds.

Araucanians, a-raw'-kd-rites, in Geol., a term applied to specimens of fossil wood, resembling in structure that of living Araucaria. These fossils are common in the chalk, wealden, colite, and liss of Great Britain. Britain.

ARBALEST, ar'-bā-lest (Lat. areubalista, a crossbow), a weapon of war, the precise date of whose first introduction is unknown; but, according to some, it was in use in the Roman armies as early as the time of Constantine. It is supposed to have been introduced into England by the Normans. It was disused in England, as a weapon of war, in the reign of Henry VIII. The bowmen were distinct from the arbalesters, or crossbowmen. The arrows used with Henry VIII. The bowmen were distinct from and arbalesters, or crossbowmen. The arrows used with the crossbow were short and thick, and were called quarrels, from the French carreaux.

ARBITRATION, ar-bi-trai'-shon (Lut. arbitrium litis), ABBITEATION, ar-bi-tresi-shon (Latt. arbitrum tatil), in Law, is where contesting parties submit the action, suit, or any or all matters in dispute, to the judgment of an indifferent person or persons, called an arbitrator arbitrators, to decide the controversy; and where more than one is appointed, it is usual to appoint, or leave the arbitrators to appoint, an umpire (imperator or sinpar), to whose sole judgment it is then referred. The decision, in any of these cases, is called an award, which is final if not set saide by a court fer information.

mercury into a clean glass bottle, containing a solution of nitrate of silver. If left undisturbed for a few days, beautiful arborescent forms of metallic silver rise from the surface of the mercury, continuing to increase as long as there is any nitrate of silver left in the liquid.

ARBORESCERT, ar-bo-res'-est (Lat. arbor, a tree), in Chem., a term applied to crystals that assume a tree) like form. A small quantity of milk added to a solution of any sait will after its crystallisation to the arborescent form. Very beautiful arborescent metallic crystals may be formed for the microscope by planing an atom of copper in a drop of mitrate of silver, placed

on a glass slide. (See CEYSTALLIZATION.)

ARRORICULTURE, ar'-bor-i-kul-ture (Lat. arbor, tree), ARRONICULTURE, or content character (hardwork tree), the art of cultivating trees. The term is usually restricted to the planting and management of timbertrees; the cultivation of fruit-trees being regarded as a branch of horticulture. The ancients obtained their timber from natural forests, and only practised arbori-culture in landscape-gardening, or in forming public walks near their cities. In America, tree-felling, instead of tree-planting, occupies the time of the im-provers of land; and it will be long before arboriculture will be practised on an extensive scale on a continent so thickly wooded. The cultivation of timber-trees is so thickly wooded. The cultivation of timber-trees is unnecessary whilst natural forests are abundant. In England, plantations for timber and fuel were first established in the 16th century; and from that period arboriculture has steadily advanced. In the 17th century, the publication of Evelyn's Sylva did much to promote the taste for the art; and the greatly-increased demand for oak for shipbuilding gave a new invalue to its restricte. No extensive plantations were impulse to its practice. No extensive plantations were made in Scotland until the beginning of the 18th century, or in Ireland until the close of that century. In France and Germany, and in other parts of Europe, economical arboriculture has not made much progress. and is still almost confined to the management of and is sain among comment to the infragement of natural forests. In this department, however, the continental peoples, particularly the Germans, have made great strides, and have developed to their fullest extent the resources of their vast timber districts. Plantations are usually formed in Britain with seed-lings,—young trees raised from seed in nurseries; but sometimes, also, by sowing the seed on the ground which is intended for the plantation. Some authorities pronounce the latter plan to be the better of the two, believing that finer trees are produced when the seedlings are permitted to remain undisturbed on the ground in which they passed through their first stages of development. The gaps formed by the removal of timber in the natural forests of France and Germany are invariably filled up by sowing the seed. Trees may be conveniently classified according to their uses. may be conveniently classified according to their uses. The following is the system usually adopted:—1. Resinous or comferous trees,—the pines and firs. These yield straight timber for masts and long planks. 2. Hard-wooded trees; as the oak, sah, eim, beech, chestaut, walnut, sycamore, birch, thorn, hickory, holly, and box. Most of these trees fyrnish handsome, strong, and durable timber, such as is suitable for shipbuilding, household furniture, earts, tools, and various mechanical purposes. Some of them—the oak and chestnut, for instance—afford crooked pieces of timber for knees or bende in the ribs of ships: oak and chestnut, for instance—afford crooked pieces of timber for knees or bends in the ribs of ships; others, such as the thern and hickory, give pieces of remarkable toughness. 3. Soft-wooded trees; as the poplar, lime, horse-chestnut, alder, and willow, which yield wood suitable for turnery, basket-work, fuel, and a variety of useful purposes. In this class we may include the trees which are grown for flexible suckers and contract four beauty below to the state of the suckers. und apray to form hoops, baskets, besoms, and poles.

Hef. Brown's Forestor; Chambers's Information—
Arbosseulture; Traité das Arbosseulture; Mirbel et Poiret

ARBOR VITE, or'-bor vil-te (Lat., tree of life.) (See

TRUJA.)
ARRUSCULES, ar-bus'-ku-bus, in Bot., a term employed

ARBUTUS, ar-bu'-tus, in Bot., a gen. of plants belong-

sembling in shape and colour that of the strawberry. The corolls is urn-shaped. The most remarkable species is A. weede, which is a native of the south of Europe and the Levant, but new found also in Asia and America. It is cultivated as an ornamental evergreen-tree in Britsin, where it frequently attains the height of nearly swenty feet. It is commonly called the strawberry-tree. The most interesting specimens in the British isles are at the Lakes of Killarney, where they formflovely groves. A. Androckes, the Oriental arbutus, is even more elegant than the Killarney, where they formflovely groves. A. Lauruchus, the Oriental erbutus, is even more elegant than the common species; but, at the same time, it is much more delicate, and will not thrive in our variable climate. A. Jurens is a small shrub growing in Chili, and yielding a fruit having strong narcotic properties. ARC, art (Lat. arcus, a bow), in Geom. signifies any part of a curve line. The straight line which joins the arthur properties and the carbonities of the arc. is called its chord. The

the extremities of the arc, is called its chord. The practical operation for finding the length of an arc is as follows:-Divide the arc into a number of smaller as follows:—Divide the arc into a number of smaller ners, making the number large in proportion to the degree of accuracy required, then add together the chords of the smaller arcs. The sum of the chords will differ but little from the arc, even when the subdivisions are not numerous. For example,—the arc of the quadrant of a circle whose diameter is 10,000,000. of inches is 7,853,982 inches within half an inch. Divide this quadrant into ten equal parts, and the sum of the chords is 7,845,910 inches; divide the quadrant into fifty parts, and the same sum is 7,853,659 inches, which is not wrong by more than one part out of 24,316. For is not wrong by more than one part out of 23,316. For only twenty subdivisions the sum of the chords is 7,861,963 inches, wrong only by one part out of 3,890; therefore, for every practical purpose, an arc of a circle—and the same may be said of every other curve—is the polygon made by the chords of a moderate number of subdivisions of the arc.

ARCADE, ar-kaid' (Fr.), in Arch., a term applied to a series of arches of sur form supported on pillars either inclosing a space before a wall or any building which is covered in and paved, or, when used as an architectural feature, for ornamenting the towers and walls of churches entirely closed up with masonry. The cloisters of the old monasteries and religious houses were, strictly speaking, areades; and the covered walk round Covent-Garden Market is an areade, wrongly called a piazza. The term is also applied to a covered passage, with shops on either side, as the Lowther and Burlington Arcades in London. Poautiful specimens of the ornamental arcade may be found in many of our eathern drals and churches, as well as in many ruins; among which may be mentioned the striking and magnificent remains of Glassoubury Abbey, Somersetshire.

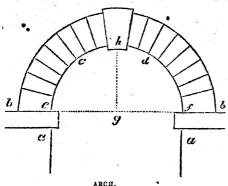

ARCANUM, ar-kei'-num (Lat., a secret), a term frequently employed by the old alchemists and philosophical writers, and usually used to designate any substance the mode of preparing which was kept secret. Thus, the ancient chemical philosophers called the red oxide of mercury, which was produced by the action of nitric acid, arcanum corollanum; sulphate of potash was termed, by the same writers, arcanum

diplicatum, &c.

Ance, arch (Lat. areas, a bow, a curved line), a structure, generally of stone or brick, in a curved form, over an open space, the pieces of which are arranged in a mauner calculated to bind them closely together by the pressure of one against another, rendering them capable of supporting a great weight of missoury above them. The ends of an arch are supmasonry above them. The ends of an arch are supported on columns or sides of masonry, called abutments or piers (a, a), rising perpendicularly from the ground; the arch is said to spring from its piers, and the first stones resting on the piers on either side (b, b) are sometimes called the springing-stones. The upper part of the arch is called the crown (a, d), and the stone in the centre (a), in the form of a wedge, which locks or binds the arch together, is termed the keystons. The sides of the arch (ec, d'), between its crown and piers, are called its kausches, or figals. The stones which compose the arch, all wedge-shaped, smaller at the under end than at the upper, are called vosaciva, while the under ends of the stones are called the index, or soft, and the upper ends the extrados, or All of the ust. ord. Ericaces, consisting of small trees trades, or selfit, and the upper ends the estrades, or and shrubs, most of them natives of America. The back. The line joining the extremities of the arch fruit is fleshy and many-seeded; in some species re- (cf) is called its span, and one drawn perpendicular 110

# Arch, Triumphal

to the span, from its central point to the centre of the bottom of the keystone (gh), its rise. These lines are also called the chord and versed sine of the arch. The also called the chord and versed sine of the arch. The Egyptians and Assyrians are said to be the first nations who used the arch in their buildings; arches, both of stone and brick, having been found by Belzoni, Wil-kinson, and Layard, at Thebes, Gizsh, Nimroud, and Khorasbad. The form of the arch is supposed to have been known to the Greeks, although there is no evi-dence, in the remains of their temples, to show the truth of the supposition. The Romans were fully acquainted with its constructive value, and were pro-

bably the means of introducing it, in its most simple and primary form—that of a semircircle—into Euro-pean architecture. The Britons and their priests, the pean architecture. The Britons and their priests, the Druids, were entirely ignorant of its use; the Saxons, however, approached the form of the arch by placing two stones in a slanting position against each other, like the sides of an equilateral triangle, supporting them on piers. The only forms used, until the adop-tion of the pointed arch in Mediaval architecture, in the 12th century, were the semicircle, segment of a circle, and ellipse? The horse-shoe form, peculiar to Arabian architecture, was probably derived from the segment of a circle greater than a semicircle. pointed arch was used by the Arabs as early as the 9th century, and is supposed to have been introduced into Europe at the close of the first crusade, and adopted, in various forms, as a pronfinent feature in Gothic architecture. The mechanical principles of the construction of arches will be treated elsewhere. (See BRIDGE and EQUILIBRIUM OF ARCHES.)

ARCH, TRUMPHAL, was a structure raised by the Romans to celebrate a victory, some grand historical event, or to add a greater lustre to the commemoration of the military deeds of a victorious general. These monuments had their origin in the custom of adorning with the spoils of war the gate by which a successful military leader entered Rome on his return from the battle-field. In time, these temporary monuments gave place to others of an enduring nature, such as stone or bronze. The arcus triumphalis, as this kind of structure was termed by the Romans, was generally erected in some main thoroughfare. The design was commonly either one large arch, or one large central arch, with one or two smaller ones at each side. In every case the fronts and sides of the structure were ornameuted with trophies, the entablature being surmounted with some piece of sculptural allegory, be-neath which was an inscription narrating the deeds of the hero in whose honour the arch was erected. Many of these celebrated structures are still in existence, the most remarkable being,—the arch of Augustus, at the most remarkable being,—the arch of Augustus, at Rimmis; the arch of Trujan, at Beneventum, and another at Ancona; at Rome, those of Constantine, Septimius Severus, Drusus, Callienus, and Titus; the most heautifully-proportioned, and at the same time which is in the man, Mathat of Constantine. Ma

# Archmology

departed Roman greatness are in existence in various parts of France, Greece, Spain, and Egypt. In modern days France has the greater number of these strinctures. Paris possesses the triumphal arches of the Porte St. Donis and St. Martin, built respectively in 1673 and 1874, to celebrate the victories of Louis XIV. The fine Arc du Carrousel, forming the western en-trance of the Tuilories, creeted to the honour of the French armies, was commenced in 1906, and finished in 1809, its height being 47 feet, its breadth 55. Surmounting the structure is a grand equestrian group, formed of a chariot, to which four horses are yoked.

the steeds being guided by the allegorical statues of Peace and Victory. But the grandest and most colossal triumphal arch erected by the moderns is that standing at the end of the Avenue des Champs Elysées, at Paris. It was erected in commemoration of the victories of Napoleon I. and his armies, and, although commenced in 1806, was not completed till after the revolution of 1830. It has three arches, the height of the central one being 95 feet. In the interior are graven the names of the most celebrated French generals, with that of their leader. The English capital possesses only two structures of this kind,—the arch at Hyde Park, upon which the equestrian statue of the duke of Wellington is placed, and the Cumberland Gate.

Weilington is placed, and the Cumberland Grate. Archaroctolaria, archeo-sid-dris (Gr. archaios, ancient, kidaris, turban), in Geol., a gen. of turban-shaped sea-urchins, fould in a fossil state, in carboniferous and Permian strata. (See Cidaris.) Archeoniscus, archeo-sid-lus (Gr. archaios, ancient; Lat. oniscus, woodlouse), in Geol., a gen. of fossil crustaceums, occurring in the Purbeck strata, and bearing considerable resemblance to the common woodlouse.

Alcheology, ar-ke-ol'-o-je (Gr. from archaice, old, ancient, and logos, a discourse), the name of the science which causes us to become acquainted with the antiquities of nations that have risen and fullen, and the remains of various kinds which throw a light upon the history of those that exist at the present time. Almost every kingdom now boasts its national archeological society; and in England there are many local associations, the members of which are sedulously engaged in the study and discovery, as well as the preservation, of the antiquities in their immediate neighbourhood, and in the counties in which they have been instituted. The term is capable of a very widely-extended signification, including everything that is connected with the rise and progress of any nation, its history, laws, religious observances, public and private buildings, manners, and customs of all classes of the people, the arts in use among them, and the extent of their acquirements in soicnee and scientific discoveries. The archeologist fallen, and the remains of various kinds which throw science and scientific discoveries. The archeologist seeks to study and preserve any materials which tend to elucidate the subjects already mentioned, and those materials naturally resolve themselves into three great classes, each capable of further subdivision. The first casses, each capable of further subdivision. The first class may be considered to consist of all records, written or printed, legal documents, old chronicles, disries of a public or private nature, state papers, letters, &c. The second may be termed oral, or traditional, in contradistinction to the first, which may be broadly called written archaelogy, and coasists of the ballads, legends, and folk-lore of a people, their sports, superstitions, and the rise and origin of local the hallads, legends, and lok-lore of a people, their sports, superstitions, and the rise and origin of local customs, proverbs, and expressions. The third, termed monumental archeology, consists of works of art, paintings, sculpture, coms, medals, glass, pottery, utensis of wood, metal, and other materials; tools of every description, armour, weapons, darriages, boats, roads, canals, walls, encampments, burisl places, carthen mounds for purposes of defence or sepulture, and over human remains and those of animals. The British Museum contains an abundant store of Egyptian, Assyrian, Greek, Roman, British, and other antiquities; and in many local collections, both of a public and private character, there are ample gatherings for the study of archaeology; but they are principally materials of a monumental nature. Additions to these collections are continually being mode by exploration. In the the oldest, being that of Titus, whose conquest of a monumental nature. Additions to these collections Judga it was built to celebrate. The sriumphal arch which is in the most perfect state of preservation is great works now constructing under London itself, that of Constantine. Many similar monuments of many feet below the present surface, tesselated pave-

ments, coins, tools, walls, and other remains, are constantly laid bare, which, in conjunction with such discoverice as that of the buried Roman city of Uriconium, or Wroxeter, lately found near the borders of Wales, are invaluable in illustrating the habits of a people that once held Great Britain as a tributary province, unrolling a page in which the antiquary can read many a fact traced in characters which cannot be mistaken. Societies such as the Roxburgh, Bannatyne, and Mattland clubs, have principally turned their attention to the preservation and reproduction of old printed records, and the publication of old writings of all sorts; while Sir Henry Ellis may be considered as one of the most active promoters of the preservation of traditional archaeology, or folk-lore, as his edition of Braud's" Popular Antiquities," published some twenty years since, will fully show. The government of this country, which formerly looked with suspicion on the enrolment of a society of archaeologists, now offers every facility and inducement to encourage the study of this science. The Society of Antiquaries, the parent society of all the associations now in existence in England, was founded in 1572, and broken up about thirty years after, by order of James I. It was mistaken Societies such as the Roxburgh, Bannatyne, ence in England, was founded in 1872, and broken up about thirty years after, by order of James I. It was revived in 1707, and the members received a charter of incorporation in 1751. In 1780 the Scottish Society of Antiquaries was founded, and, sir years after, the Royal Irish Academy, instituted for a similar purpose. All these societies have given their attention to the collection of archæological records of all sorts, and possess valuable museums. Among other societies of a similar nature on the continent, may be mentioned the Royal Society of the North, at Copenhagen. The museums of Paris and Naules nessess flue collections museums of Paris and Naples possess fine collections of Egyptian, Greek, and Roman antiquities, the officers of the latter especially collecting Roman remains from the excavations made on the sites of the cities of Pompeii and Herculaneum, buried by an eruption of Vesuvius in the year 79. Every country possesses, in a greater or less degree, relies of antiquity of the greatest interest to the archerologist. From the sculptured stones and obelisks of Egypt and Assyria, records have been unravelled by Rawlinson, Layard, and others, that throw great light on the early history of these countries, and offer convincing testimony to the indisjoutable truth of Holy Writ. In Mexico and Central America, evidences have been traced of the existence of a clever and ingenious people that had passed from the surface of the earth before the discovery of the Western hemisphere by Columbus. In the excavations made on the sites of the cities of Pomall countries, especially those under British rule, col-lections of antiquities are eagerly made; and in pro-portion to the encouragement and advance of archa-ology, history will become the record of a people's customs and household words, instead of a stern cata-logue of bloody wars and the ruthless deeds of kings and ambitious men who sought to make the people stepping-stones by which they might gain the objects of their desire.

of their desire.

ARCHAISM, ar'-kai-ism (Gr. archaios, ancient), is a term employed in Lit. and Rhet. to denote the use of an obsolete word or phrase, in order to give an air of antiquity to the passage in which it occurs.

ARCHAIGEL, ark'-ain-jet (Gr. arche, chief, and aggelos, an angel), a term employed to denote a high order of angelic beings. In Scripture the term is only applied to Michael, and is nowhere employed in the plural. Holy Writ seems to indicate that there are different degrees and orders aronn archie beings. different degrees and orders among angelic beings, but gives no specific information on the subject.

but gives no specific information on the subject.

ARCHARGLIG, ork-im-jet'-i-ki, in Bot., the herb Archangel, a gen. of plants belonging to the nat. ord. Umbellifere. The species are mostly herbaceous and perennial, natives of the cold and temperate regions of the northern hemisphere. A. officinalis, the garden angelica, is an indigenous biennial, growing in watery places, but somewhat rare in this country. It grows in moist situations, and flowers from June to September, the blossoms being greenish-white. Its root is large and flesby, resinous, and pungently aromatic. It is imported from Hamburg in the dried state for medicinal purposes, being stomachic and carminative. The fruit, improperly termed the seed, has similar porennial, natives of the cold and temperate regions of the northern hemisphere. A. officinalis, the garden angelics, is an indigenous biennial, growing in watery places, but somewhat rare in this country. The fruit, improperly termed the seed, has similar properties. The tender stems and mid-ribs of the properties. The tender stems and mid-ribs of the originally merely the chief of the deacons, who were leaves are boiled in syrup, and, when dried, constitute

candied angelica, which, taken as a dessert, is a very agreeable stomachic. The plant is cultivated for the purpose of candying in the neighbourhood of Loudon. Large quantities of angelica are consumed by the rec-tifiers in the preparation of London gin and the liquor known as "bitters."

liquor known as "bitters."

ARGENISHOF, arch-hish-op (Gr. arche, chief, and episkopps, bishop), is 'the title given to a bishop who, besides exerciaing episcopal authority in his own diocese, has an admitted superiority, and a certain jurisdiction, over the bishops in his province, who are sometimes called his suffragans. He is also sometimes called primate or metropolitan. The title came into use in the 4th century. At first the term was considered as equivalent to patriarch, or bishop of an imperial diocese; as Rome. Constantinople, Angioch, Alexandria, Ephesus. After the 6th century the srch-bishop of Rome assumed the title of Pope. In England there are two archbishops, of whom the one has his seat at Canterbury, the other at York. The archbishop of Canterbury is styled Primate of all England, and is the chief medium of communication between and is the chief medium of communication between and is the chief medium of communication between the crown and the olergy, being consulted by the ministers on all questions touching the ecclesiastical part of the constitution. He has precedence of all temporal peers except those of the blood royal. The Lord-Chancellor takes precedence after the archbishop of Canterbury, and before the archbishop of York, who is styled Primuste and Metropolitan of England. His province consists of the six N. counties, with Cheshire, Nottinghamshire, and the Isle of Man, and he has six suffragans—the bishops of Durham, Carlisle, Chestor, Ripou, Manchester, and Sodor and Man. The rest of England constitutes the province of the archbishop of Canterbury. The precise amount of superintendence England constitutes the province of the archisano of Cauterbury. The precise amount of superintendence or control which may be exercised by an archisano over the bishops of his province does not seem to be very accurately defined; but if a bishop introduces irregularities into his diocess, or is guilty of immoral-ties, the archisanop may call him to account, and even deprive him of his office. In Ireland there are two Protestant and four Roman Catholic archbishops. Of the former, the archbishop of Armagh is styled Primate of all Ireland, and has five suffragan bishops; the archof all freiand, and has are surragan bishops; the archishop of Dublin is Primate of Ireland, and has also five suffragan bishops. The election of an archbishop does not differ from that of a bishop (see Bishop); but while a bishop is only installed in his offlice, an archbishop is enthroned. An archbishop is styled "Grace," and "Most Reverend Father in God," and "Grace," and "Most Reverend Father in God," and writes himself "by Divine Providence;" a bishop is styled "Lord," and "Right Reverend Father in God," and writes himself "by Divine Permission." During the vacancy of a see, the archishop is guardian of the spiritualities; and he also nominates to the benefices or dignities at the disposal of the bishops in his province, if not filled up within six months. Every bishop, whether created or translated, is bound to make over he dead the next presentation of such henging or directions. whether created or translated, is bound to make over by deed the next presentation of such benefice or dig-nity belonging to hissee, as the archbishop may choose. The archbishop of Canterbury claims the right of placing the crown upon the head of a king at his cor-nation; and the archbishop of York claims to perform the same office for the queen consort.—Ref. Knight's English Cyclopædia.

English Cyclopadia.

ARCHDRACON, arch-de'-kon (Gr. arche, chief, and diakonos, a servant or officer), is an ecclesiastical dignitary next to a bishop. Each diocese comprises one or more suchdescoury, over which one of the clergy is appointed to preside. He must be a priest of at least six years' standing; and his duty is to visit his archdeacouries from time to time; to see that the churches, and especially the chancel, are kept in repair, and that everything is done conformably to the canons; and to receive from the churches arms arms are transported in the chance of t

#### Archduke

affairs. His functions were confined to attending upon amairs. Its functions were commed to attending upon and assisting the bishop in the discharge of his spiritual duties, and the management of his diocese, without laving at first any jurisdiction. There are intra-seven archiesconries in England and Wales.—Ref. Knight's English Cyclopadia.

ARCHDURE, arch-duke', a duke-whose authority and power is greater than that of other dukes. In France, power is greater than that of other dakes. In France, in the reign of Dagobert, there was an archduke of Austrana; and, at a later period, the provinces of Brabant and Lorraine were termed archduchies. The dukes of Austria assumed the title of archduke in the

dukes of Austria assumed the title of arconduct in the year 1165; but the dignity was not confirmed till 1453. In the present day, none but the princes of the house of Austria affect the title.

Archægosatheus, ar'-ke-go-saw'-rus (Gr. archegos, beginning, sanros, lizard), in Geol., the name signifying 'primeval lizard,' given by Goldfuss to a reptile of the Carboniferous era, allied to the existing reptiles, the preference of levidoriser.

the tarbonnerous ers, and to the existing repriles, the proteins and lepidosiren.

ARCHER, (See Archers).

ARCHER-Fish, ar'-cher fish, a curious little fish inhabiting the Chinese seas. Lurking near the surface of the water, it awaits the approach of an insect, and then condens to curious within including suddenly squirts at it a drop of water, which infallibly brings it down. It is about seven inches long, and has a wide mouth, with the lower jaw considerably pro-longed. The Chinese keep these fishes in jars, and amuse themselves by watching the effect of suspending a fly above a jar with a thread.

ARCHERY, ar'-che-re, the art of shooting with a bow and arrow, so called from the Latin word areas, a bow. With respect to the origin of archery, we nothing more than that it must have been practised at a very early period; for we are told that Hagar, in order not to see her son die, set herself down a good way off, as it were a how-shot; and soon after it is said that Ishmael dwelt in the wilderness, and became said that Ishmael dwelt in the wilderness, and became an archer. The bow and arrow are frequently mentioned in Scripture, more particularly in the accounts of the wars of the Jewish people. Indeed, down to the introduction of gunpowder, the bow-and-arrow was an implement of warfare among all nations in all states of civilization. Great dependence was usually placed upon the archers in war; and frequently the success of a battle hag been attributed to their means, as at Cressy, Politiers, and Aguicourt. It is believed that the long-bow was common in England long before the Sayon invasion. The Sayons were expect archers that the long-bow was common in England long before the Saxon invasion. The Saxons were expert archers, both in battle and in field sports. The Normans brought with them the arbalest, or crossbow; but, from the reign of Edward II., the long-bow, the favourite national weapon, seems to have been fully established. Edward III. directed the sheriffs of shires to see that the people exercised themselves in their leisure time in archery, in place of following uscless or unlawful games or amusements. Chancer, in his prologue to the Canterbury Tales, gives the following carefully-drawn picture of an archer of his day :

"And he was clad in coat and hood of green;
A sheaf of peacock arrows, bright and keen,
Under his belt he bare full thriftily. Well could he dress his tackle yeomanly; His arrows drooped not with feathers low, And in his hand he bare a mighty bow. His head was like a nut, with visage brown : Of woodcraft all the ways to him were known:
An arm-brace wore he, that was rich and broad,
And by his side a buckler and a sword; While on the other side a dagger rare, Well sheathed, was hung; and on his breast he bare
A large St. Christopher of silver sheen.
A horn he had, the baldric was of green,—
A constant truly was he, as I guess." A forester truly, was he, as I guess.

A forester truly, was no, as I guess."

Under Edward IV. a precept was issued, commanding that every Englishman and Irishman in England should have a bow of his own height; and butts were ordered to be set up in every township for the inhabitants to shoot at; and, if any one neglected the use of his bow, he was subject to a fine. In the reign of Henry VIII. it was ordained, that every man under sixty, except spiritual men, justices, &c., should use shooting with the long-bow, and have a bow and arrows continu-

# Archery

ally in his house; that every father shall provide a bow and two arrows for his son when he shall be seven years old; and that every servant above seventeen and university years of age shall pay 6s. 3d. if he he without above and arrows for one month. Latimer, in one of his sermous before Edward VI., published in 1549, strongly the practice of archery, saying,—"In my old; and that every servant above seventeen and under sermous before Edward VI., published in 1549, strongly enforced the practice of archery, ssying,—"In mytime my poor father was as diligent to teach me to shoot as to learn me any other thing; and so, I think, other men did their children. He taught me how to draw, how to lay my body in my bow; and not to draw with strength of arms, as other nations do, but with strength of the body. It is a godly art, a wholesome kind of exercise, and much commended in physic." After the destruction of the Spanish Armads, fears being entertained lest the king of Spain should send an emissary to attempt the life of Queen Elizabeth, a number of obblemen of the court formed themselves into a bodynoblemen of the court formed themselves into a body-

ENGLISH ARCHERS.

guard, for the protection of her person, and, under the denomination of the "Companie of Liege Bowmen of the Queene," had many privileges conferred upon them. Upon the accession of James I. this company was disbanded, although those who composed it re-tained the privileges which had been conferred upon them by Elizabeth. Upon the breaking out of the civil war, Charles I. reorganized this body-guard, which attended him against the parliamentary forces, and afterwards emigrated with Charles II. At the Restoration this company was maintained, and, under the title of the "Royal Company of Archers," received a new charter; it afterwards merged in the Artillery Company of London. Recently, archery has come to be revived as an anusement, and societies have been formed for the practice of it in various parts of the country. The Toxophilite Society of London was first formed for the practice of it in various parts of the country. The Toxophilite Society of London was first established in 1781. One of the largest and most flourishing of these societies is the "Royal Company of Archers of Scotland." It is said to owe its origin to the commissioners appointed by James I. of Scotland to superintend and regulate the practice of archery throughout the country, when a number of the most expert archers were selected to form a body-guard for the king. They claimed the honour of action in this the king. They claimed the honour of acting in this the king. They claimed the honour of acting in this capacity on the occasion of the visits of George IV. to Edinburgh, and they now constitute part of the royal household in Scotland. The principal instruments of archery are the bow, string, arrow, gleve, and brace. Hows are of two kinds, called self-bows and back-bows. Self-bows are those that are made of only one piece of wood, the best being foreign yow. Back-bows are composed of two kinds of wood, being strengthened by a nices of ash or other tough wood, firmly glued to the a piece of ash or other tough wood, firmly glued to the

#### Arches. Court of

back. An arrow is furnished with three feathers, one of which, of a different colour from the others, is placed uppermost on the string, and is called the cookfeather. The piles or heads are made either blunt or charp; the advantage of the former kind being, that they are more easily extracted than the latter. The weight of the arrow should be proportioned to the strength of the bow. For bows of 5 feet, arrows of 24 inches are commonly used; and for those of 5 feet 9 inches, arrows of 28 or 29 inches. The nock of the arrow is asnally cased with horn, and should be made so as to exactly fit the string. The shooting-glove is used to protect the fingers from being injured by the string, and consists of three linger-stalls, back-slips, and a cross-strap buttoned round the wrist. The brace is a piece of stout polished leather, buckled round the bow arm, to protect it from the string, as well as to allow the string to glide sharply and quickly over it. Besides these, there are the quiver, a tin case for holding the arrows not immediately in use, and the belt, worn round the waist, from which are suspended the tassel for wiping the arrows, and the grease-box, containing a composition with which the fingers and brace are occasionally anointed, and which has also a pouch for holding arrows intended for present use. To be a good archer demands long and continuous practice. The muscles of the body must be brought into a certain degree of strength and firmness, the mind must be caim and collected, and the eye steadily fixed

must be caim and collected, and the eye steadily fixed upon the mark. The principal points to be attended to in practice are standing, necking, drawing, holding, and loosing on each of which much useful information will be found in the Toxophilus of Roger Ascham. The distance to which an arrow can be sent by a good archer is generally from 200 to 250 yards.

ARCHES, COURT OV, ar-ches (Lat. curia de arcabus), the chief, and most ancient consistory court, belonging to the archbishop of Canterbury, for debating of spiritual causes, whereof the judge (who sits as a deputy to the archbishop) is called the Dean of the Arches; because he anciently held his court in the church of St. Mary-le-Buc, in Cheapside (Sancta Maria de Arcubus), though all the principal courts are now holden at Doctors' Commons. Bow Church is so named from the steeple, which is raised by pillars built archwise, like so many bent

AMCHETYPE, ar'-ke-tipe (Gr. archetupos, from arche, chief, and tupos, form), properly signifies the pattern or model after which anything is made. In Phil, the term was used by Plato to denote the idea or pattern of the world which existed in the mind of Deity previous to its creation, and according to which it was made. Hence, all things were formed after original archetypes in the divine mind, which thus possessed within itself an archetypal world corresponding to this sensible world; while our minds, as partisking of the nature of the divine, also have archetypal forms

of sensible objects.

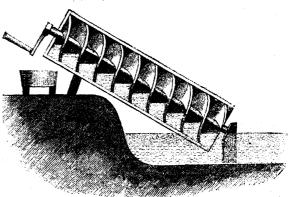

ARGHI, or ORCHIL, or 'kil or arch'-il.—The red, violet, and blue colouring matters known in commerce by the names of archil or orchil, cudbear and litmus, or turnsole, are obtained from the Rocella tinctoria, and other lichens growing on the rocks of the Canary and Cape de Verde Islands, the Cape of Good Hope, the Pyrenees, and other parts of the world. The colouring matter, which is termed by chemists crysthress, does not exist in the lichens ready formed; but they contain certain acids, which, under the influence of alkalies, are transformed into colouring matter. The lichens are first cleaned and made into a paste with stale urine, to which lime has been added. This mixture is exposed to the air for some weeks, fresh urine being added from time to time. The paste thus obtained is dried, and constitutes the archil of com-

## Archimedes, Principle of

merce. Cudbear is obtained similarly from the Lenanona tarturea. Litmus is prepared from Rovella timetoria, carbonate of potash and carbonate of simmonia being substituted for the urine. It is made up for the market into little cubes with chalk or plaster of Paris. These dyes are rarely used alone, from their want of permanence; but they are extremely valuable in imparting bloom and force to other dyes.

ARCHIMANDRIER, ark'd-mein'-drife (Gr. arche, chief, and mandra, a fold or monastery), in the Greek church is the title of the superior of a monastery, and is equivalent to abbot.

ARCHIMEDEAN SCREW, or SPIRAL PUNP, ar-ki-medde-da, a pachine invented by Archimedes, the celerated Syracusan philosopher, while studying in Egypt, in the third century n.c. Observing the difficulty of raising water from the Niet to places where the flood tide could not reach, he is said to have devised this screw as a means of overcoming the obstacle. It consists of a pipe twisted spirally round a cylinder, which, when at work, is supported in an inclined position. The lower end of the pipe is immersed in water, and when the cylinder is made to revolve on its own axis, the water is raised from bend to bend in the spiral pipe until it flows out at the top. The Archimedean screw is used in Holland for raising water and draining low grounds. The Dutch water screws are mostly large, and are moved by the wind one windmill furnishes the motive power to several screws.

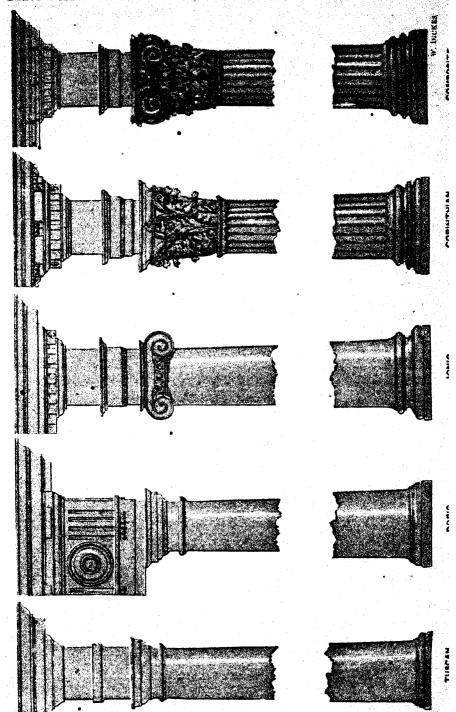

ARCHIMEDRAN SCREW. (SECTION.)

ARCHIMEDES, PRINCIPLE OF, ar-ki-me'-dees, a celebrated principle in the science of Hydrostatics, the discovery of which is attributed to the Syracusan philosopher whose name it bears. This important theorem may be thus expressed: when a solid is immersed in a fluid, it loses a portion of its weight, and this portion is equal to the weight of the fluid which it displaces, that is, to the weight of its own bulk of the fluid. An experimental proof of this highly-important principle is obtained in the following manner:-From one of is obtained in the lonowing manner:—From one of the arms of a balance is suspended a hollow cylinder, having a cylindrical mass of any substance capable of exactly fitting into it hanging from it by means of a thread. From the other arm of the balance hangs a scale-pan, into which weights are placed until the solid cylinder and the hollow one are exactly counterbalanced. Water is then poured into a vessel around the solid cylinder, until it is completely immersed; upon which the weights in the scale-pan will preponderate, the solid cylinder seeming to have lost a considerable portion of its weight. The balance will, however, be once more brought into equilibrio if water be poured into the upper hollow cylinder until it is quite full. Now, as this hollow cylinder is of such a size that the solid mass exactly fits its interior, it follows that the water with which the hollow cylinder. is filled is precisely equal in bulk to the solid cylinder. which proves that the apparent loss of weight suffered

¢

# Plate VIII.—ARCHITECTURE.

### Architect

by the latter is precisely equal in weight to a mass of water equal in bulk to itself. This very ingenious water equal in bulk to itself. This very ingenious method forms one mode—not the most exact, howtained. (See Specific gravity of solids is ascortained. (See Specific Gravities.) A wonderful story is told in connection with the discovery of this story is told in connection with the discovery of this celebrated principle. Hiero, kingof Syrasuse, intending to make an offering to the gods of a crown, commissioned a goldsmith to manufacture one of pure gold. After a time, the crown was brought home, of the full weight; nevertheless, it was suspected that a part of the gold had been stolen, and a like weight of silver substituted. Arobimedes was desired to devise a means of selecting the found and while anguard in selection

of detecting the fraud, and while engaged in solving the difficulty, he happened to go into the bath, where, observing that a certain quantity overflowed, equal to the bulk of his body, he instantly saw that what Hiero sought to know might be obtained. Carried away by his ardour and delight, he is stated to have hastened home without waiting to dress, crying out, "Eureka! eureka!" (I have found it! I have found it!)

Architect, ar's-teets (fr. architecture, or the art of building, who forms plans and designs for edifices, and under whom the work is conducted to completion. A thorough knowledge of mathematics is an indispensible will article and a second control of the second c sable qualification in an architect; he should also be expert in perspective-drawing. His emoluments are appear in perspective-trawing, it is emoluments are appearally 5 per cent, on the amount of money expended.

Perhaps the most remarkable instance of a departure from this catchingted principle are a few forms. from this established principle was made in the case of the late Sir Charles Barry, the architect of the Westminster Palace. Some time after the commencement of this structure, it was arranged that the architect's remuneration should consist of £25,000, a sum which, although subsequently increased, was immeasurably below that which he would have received had the ordi-

below that which he would have received had the ordi-nary rate of requital been followed.

ARCHITECTURE, ar-ki-tek'-ture (Lat. architectura, art of building; Gr. archas, chief, and tekton, a builder or workman), the science of building or construction, consisting of three principal divisions,—civil, naval, and military architecture. Civil architecture is that branch of the science which instructs us in the art of creeting buildings of a public and private character, bridges, and other works, in wood, iron, and masonry; the construction of buildings, such as churches, the atres, and houses of all kinds, belonging to architecture, properly so called; while that of bridges, docks, har-bours, tunnels, breakwaters, &c., is the especial pro-vince of the civil ongineer. Naval architecture, in which the English particularly excel, treats of the different methods of building ships and vessels of all kinds, with reference to speed, strength, and capacity for stowage (see SHIPUTILDING); while military archi-tecture, or fortification (see FORTHICATION), is the art of constructing works of defence, such as citadels, fortresses, and their outworks, and other constructions used for protection in warfare, by means of which we may most effectually guard against the attack of an enemy, that might be made by sea or land, on any place in which government stores are kept, naval and commercial harbours and ports, and towns situated on the frontier line of continental powers. There are five orders of architecture, known as the Tuscau, Doric, Ionic, Corinthian, and Composite, proceeding from forms of extreme simplicity to others of great benuty and elegance in design, replete with highly-elaborated ornamentation. There are also numerous styles of this important art, notices of which will be found under their respective headings. (See Arabian, Assyriam, Byzantine, Celtic, Egyptian, Gothic, Greek, Hinnoo, Norman, Renaissance, Roman Architecture, &c.) The science generally may be broadly considered under three grand divisions,—ancient, mediaval, and modern; in the first of which it may be traced from its origin to its improvement forms of extreme simplicity to others of great beauty it may be traced from its origin to its improvement under the Greeks and Romans; in the second, its state and style under the Goths, Saxous, and Normans; and in the third, the present practice of the art, and its adaptation to the requirements of our own times. Architecture in its early stages seems to have advanced hand-in-hand with civilization. The necessities of man would at first induce him to seek for some means of shelter and protection from the heat of the sun, the

## Architecture

cold wind, and dreuching rain, in the construction of the simple cone-shaped but of poles, interfaced with osiers and twigs, covered with bark, and plastered with mud, or the adaptation of the rude cave, which chance had thrown in his way, as a temporary retreat from the inclemency of the weather. After a while, from the inclemency of the weather. After a white, when the first germs of society and social life appeared, and small communities were formed by families living and small communities were formed by families living in close proximity to each other; for mutual protection,—when the earliest principles of trade and barter began to be understood, attention was naturally directed to the construction of edifices presenting, at first, greater durability and convenience, and afterwards some rude attempts at decoration; that the dwelling of the chief of the associated families, or the dwelling of the chief of the associated families, or the dwelling of the chief of the associated families. building in which any ccremonies of a religious or public nature were performed, might be distinguished from the huts of the community at large, even as we may see in our own times, in the krauls of the Hottentots and South-African tribes, the wigwams of the North-American Indians, and the huts of the Maoris, or New Zealanders. The straight upright trunks of trees would then have been used as columns to support the poles which formed the framework of the covered with bark or rushes, secured and bound to-gether with pliant twigs and ropes formed of the twisted stalks of climbing plants that were sufficiently tough for the purpose. From the rough saplings laid on the tops of the trunks of trees so used, would be derived the architrare; and, as human progress furnished tools to shape and fashion blocks of rugged stone into forms of symmetry and elegance, the trunks themselves of the trees would suggest the shapely column, with the torus, or swell above the plinth, a flat stone on which the base of the wooden pillar rested, as a foundation more solid and stable than the earth The lower ends of the branches of a tree, cut off a little above the spot where they began to grow outwards from the trunk, would give the first notion outwards from the trunk, would give the first notion of the capital, presenting, from his spreading form, a wider basis, to receive the superincumbent beams of the roof; and the abacus would have originated in a flat stone, placed on the top of the wooden shaft, to prevent any settlement of rain in the hollow at the top. Materials twisted toggsher, to bind and secure the columns, would furnish ideas for the astragal and fillet, while the frieng and compine and their regions fillet; while the frieze and cornice, and their various ornaments, would be derived from boards fastened to the ends of the transverse beams that formed the ceiling, decorated with such simple devices as short billets of wood might furnish, that were attached to the woodwork in patterns suitable to the form of the material at hand.

Ancient Architecture .- The most simple structures in stone that can be mentioned are the circular and oblong inclosures made by the Druids and priests of the Oeltic nations, of rough, unhewn, upright blocks, surmounted by similar pieces laid transversely from top to top of these rude columns. They bear some resem-blance to the undressed altars, and stones of remembrance and witness, that the worshippers of God, in the patriarchal times, and even after the entrance of the Israelites into the promised land, were accustomed to creet in his honour; and these may be taken as the general types of the commencement of the science among all nations, and in all ages. The next step would be the construction of rough irregular walls, exemplification of which may be found in the cyclopean walls of Tiryns, built by the Pelasgi, and the defensive works round Mycenae. These Grecian structures, and the tomb of Atreus, near Mycense, adorned with rude figures supposed to represent liens, with similar remains in Italy, such as the Etruscan walls at Fiesole, represent the second stage in the constructive art of huiding, which would rapidly advance from this point. The Egyptians, Assyrians, and Persians, the rulers of the known world wall as the second stage and discussed the amountains and the second stages are second stages are second stages and the second stages are second stages are second stages are second stages and second stages are second stages are second stages and second stages are second stages and second stages are second in early ages, soon discovered the convenience and comfort of dwellings made of brick and stone, and in a short time carried their architectural works to an a snort time carried their architectural works to the interedible extent. At this period, ornament began to be combined with mere building in stone; and from this combination architecture may be considered to be produced; for ornament is essential to architecture, and without the appliance of decorative features no building can be said to possess any architectural design. The

115

### Architecture

pyramids, supposed to have been built in honour of the sun; the ruins of Anders in Upper Egypt; the re-mains of Persepolis, so vast and grand 1,300 years after its destruction by Alexander the Great, that the Arubs of that date imagined the city to have been built by the agency of evil spirits; the discoveries at Nimroud and Khorashad; the sculptured relics of past ages that still exist throughout the land of Egypt, all these bear silent testimony to the constructive powers, and won-derful mechanical contrivances, of men whose build-ings, for extent, and grandeur, and sublimity of concepthey are unequal to them for harmony of proportion and examples any structures of our own times, though they are unequal to them for harmony of proportion and exammetrical beauty. That architecture was brought to great perfection by the Jows, the temple and palaces built by Solomon furnish abundant proof, and the gates and fortifications of the sacred city; and after this period Assyrian architecture reached its culminating point under Nebuchaduezzar, the most magnifect thuildings of that empire having heav resied by nating point under Nebuchaduezzar, the most magni-ficent buildings of that empire having been raised by him after models and ideas probably suggested by the grand and gorgeous works of the inspired architect at Jerusalem. From Egypt and Assyria, the Grecks, in all probability, derived their knowledge of architecture; the rows of columns in a Grecian temple, surmounted by the flat and massive architrave, bearing a strong resemblance to the heavy square roofing of the Egyp-tian palaces and banqueting halls, raised on sculptured supports of massive size and cumbrous appearance. But the gloomy magnifieence of the buildings of Egypt was not copied by the Greeks, who substituted forms of beauty and symmetry, and were influenced by a due regard for proper proportion of length, breadth, and height, in making designs for their temples and public heigh, in making designs for their temples and public buildings. They also changed the stiff, almost grotesque imitations of the human figure, as it appears in specimens of Egyptian sculpture, into copies of men and animals, faulities in outline, for the adornment of frieze and portico; and for the colossal images that were hewn by the Egyptians out of the living rock with infinite labour and toil, they produced exquisitely chiselled statues, which are still renowned as models of perfect elegance, combining health with mainsty of perfect elegance, combining beauty with majesty of expression, and strength with symmetry of form. Grecian architecture may be considered to have reached its height about 440 B.C., when the sculptor Phidias flourished, and Pericles, one of the first of Grecian statesmen, lived. In an ancient province of Italy, then called Etruria, now named Tuscany, there lived a people who had attained, some 350 years prior to this period, a high degree of civilization, proofs of which are given in the figures, vases, cups, sarcophagi, and other articles made by them, which still exist. From this nation the Romans doubtless derived the greater part of their customs and veremonies; they were well skilled in building, and Tuscan architects designed and built, and Tusean artists adorned, the temples of the gods and great public works of ancient Rome under her seven kings. The temple of Jupiter Capitolinus, and the arched sewer (the Cloaca Maxima), as well as the aqueducts that were first built to supply Rome with water, show that they well understood the science and practice of building, and made practical application of the utility of the arch, which the Egyptians and Greeks neglected, although evidence exists to show that the former nation at least were well acquainted with, though they rarely used, the principles of its construction. When Greece was conquered by the Romans, the knowledge that they had acquired of the science the knowledge that they had acquired of the science of building was extended by their intercommunication with the Greeks, who had improved the art to the utmost extent of their powers by blending utility with elegance; and from the combined skill of the Greeks and Romans we derive the five established orders of architecture,—the Tuscan, Doric, Ionic, Corinthian, and Composite—distinguished from each other by difference of proportions, as well as by the form of the column, hear, christal, and entablature. base, capital, and entablature.

hase, capital, and entablature.

Theorem of order.—This order generally has the first place assigned to it in treatises on architecture, on account of the extreme simplicity. Its general character seems to be that it has few parts, is devoid of ornament, and appears able, from its massive construction, to support the heaviest burden. It derives its name from the province Tuscany, as the Tuscans were fond

of introducing it into every edifice of great size. It is considered by some to be debased Dorio, but there is great uncertainty respecting its origin. Vitruvius is great uncertainty respecting its origin. Vitravius does not give a single example of structures of this order in his work, although he mentions its proportions. order in his work, although he mentions its proportions. The following are the comparative proportions of the order, according to Sir William Chambers, taking the diameter of the base of the column as the unit of measurement:—Height of column 7, including base §, capital §, and shaft, with upper cincture and astragal, 6; entablature 13, which is divided into 10 parts,—3 for architrave, 3 for frieze, and \$for cornice. The dimution at the top of the column should be never more than §, or less than § of the diameter at the bottom; and this proportion is observed by some in all the orders. (See Plates VIII. and IX.)

\*\*Doric Order.\*\*—This is considered to be the most

Doric Ordor.—This is considered to be the most ancient of the five orders, and takes its name from Dorus, who, according to Vitruvius, built a temple of this order to Juno, in the ancient city of Argos. At first its proportious were far more massive than at present; remains still existing in which the height of the columns does not exceed four or five times the diameter of the base. The old form of the Doric had no projecting base; and, from this circumstance, the statement made above seems to be substantiated, that the first idea of a stone column was taken from the trunk of a tree; the flutings, which appear in very early specimens, being suggested by the splitting of the bark, from heat or other causes. In the very form of the ornamentation peculiar to it, it retains more of the primitive but than any other order; the triglyph, its characteristic mark, giving the ides of the project-ing joists sawn off close, and ornamented with trian-gular billets of wood, or pieces with the edges chamfered, and the mutules, or indentations, like the teeth of a cog-wheel, under the cornice, representing the ends of the rafters. The space between the trigly his is generally curiched with ornaments, the skull of an is generally curiched with ornaments, the skull of an an and fillets or garlands being the most common. The theatro of Marcellus is always mentioned as affording the best proportions for this order. The height of the column, taking, as before, the base as the unit of measurement, is 8, including base \(\frac{1}{2}\), or a little more, shaft 7; entablature 2, divided into 8 parts, being 2 for the architraws, 3 for the frieze, and 3 for the cornice. In the second stage of the Dorio order the proportion of the column was taken from the height of a man, which is, as nearly as possible, six height of a man, which is, as nearly as possible, six times the length of his foot. (See Plates VIII. and IX.)

Ionic Order.—This order is named after Ion, the son

of Xuthus, who is said to have built a temple to Diana, seeking to imitate, in the columns which adorned it, the grace and elegance of the female form. It seems to have gained favour among the early Greek architects because the proper adjustment of the various parts of the Doric entablature was attended with considerable the Doric entablature was attended with considerable difficulty. The column was lighter than that of the Doric order, being eight times the diameter of the base. A base was added, and the capital adorned with volutes (see Voturs); the shaft of the capital was also fluted. In the ancient Ionic columns the volutes were parallel to each other; but, in the modern form, were parallel to each other; but, in the modern form, the volutes project in an angular manner, as in the Composite order. Michael Augelo was considered to have originated this change; but one or two specimens have been discovered at Rome of columns with the volutes projecting angularly. The base and capital are often enriched; but it is, for the most part, plain in character. The modern proportions of the order are as follows:—Height of column 9, including base \$, capital  $\chi_{5}^{\prime}$ , and shaft  $8_{13}^{3}$ ; or, according to the mode of measurement used by architects, in which the diameter of the base of the column is divided into two parts of the base of the column is divided into two parts called modules, and each module into thirty minutes, the capital measures 21 modules; the height of the entablature is 2½ (diameters of the base), which is divided into 10 parts,—3 for the architrave, 3 for the frieze, and 4 for the cornice. (See Plates VIII. and IX.) Corinthian Order.—This order is similar to the Ionio many respects, the same form of base being need; and a similar entablature. The great point of difference is the capital, which is richly ornamented with the larges of the divise or nearther although the agent the

leaves of the clive or scanthus, although the acanthus is said to belong rather to the Composite order. The

### Architecture

proportion between the column and entablature is the same, the entablature being one-fourth the height of the column; but the column itself is more slender and graceful than those belonging to the orders already described, being 10 diameters in height. The base is half a diameter, and the capital rather more than a diameter, or about 70 minutes. It is said that the Corinthian capital was originated by Callimachus, a sculptor of Corinth, who flourished about 540 n.c.; and that it was suggested to him by the beautiful appearance of the leaves of a root of the acanthus growing round the sides of a basket which had been placed upon it. The basket had been covered with a tile, and, when the leaves reached it, they had curled over in an outward direction, forming a kind of volute. The in an outward direction, forming a kind of volute. The extent of enrichment of the column depends on the extent of eprichment of the column depends on the degree of adornment given to the entailature. In interior decorations the fluting of the column is sometimes filled up to about one-third of the entire height with what is termed "cabling," which may be carved in various forms. From the delicacy of its proportions and the richness of its decorations, it has been called the Virginal order by Scamozzi. (See Plates VII. & IX.) Composite Order.—This order, sometimes called the

Composite Order .- This order, sometimes called the Roman order, is exactly similar to the Corinthian in its proportions, but possesses greater capabilities for enrichment. It is supposed to have been formed by the Roman architects that flourished under the Cresars, the forman arentects that nonrished under the cassars, by the union of the Ionic and Corintinan orders, as the capital partakes of both styles, having the enrich-ment of acanthus-leaves which surround the capital, surmounted by the angular Ionic volute, ornamented with the same description of foliage. This arrangement tends to give a form of greater boldness and elegance tends to give a torm of greater boiliness abut degance to the Composite order. The best examples set found in the triumphal arch at Rome, created in honour of Vespasian and Titus. (See Plates VIII. and IX.)

The national character of a people has a marked influence on the style of architecture peculiar to it.

The poetic temperament and national pride of the

The poetic temperament and national prince of the Greeks were plainly shown in the beauty of design exhibited in their temples; while the ambition of the Romans appeared in their vast public works and private dwellings, all indicating a desire for worldly power, and individual, as well as national greatness. But with the rise and spread of Christianity, architectures are the statement of the st But with the rise and spread of Christianity, architecture soon received flew features, and a striking difference was shortly perceptible between heathen temples and Christian churches, the horizontal lines that marked the sacred architecture of Greece and Rome giving place to the light and free appearance of the pointed architecture of Christian Europe.

Mediaval Architecture.—As the styles of architecture originated during the mediaval period will be noticed as perceptible of the pointed architecture originated during the mediaval period will be noticed to the period will be noticed to the period will be noticed to the period will be separately under their respective headings. it will be

separately under their respective headings, it will be sufficient here to point out, that with the advance of the Christian religion, and the division of the empire of Rome into the Eastern and Western empires, fresh or kome into the Eastern and Western entires, fresh modes of building were rapidly produced. At Constantinople, or Byzantium, as it was then called, Byzantine architecture assumed a marked character, and was, in its turn, the parent style from which Arabian architecture sprung. At Rome, a style of building was conceived which has been called Romanseque; then came the Goths from the north, asserting their supremacy over the effeminate people of Southern Europe, and bringing with them architectural forms of strength and solidity which harmonized well with their rude customs and unpolished manners. These their rude customs and unpolished manners. These styles were gradually amalgamated and improved, and this blending of modes produced, about the 13th century, the Pointed or Gothic style, modifications of which have neen generally adopted by the architects of all European nations. The origin of the term Gothic is unknown; but Bloxam says that it appeared "about the close of the 17th century, when it was employed by such writers as Evelyn and Wren, as an epithet intended to convey a feeling of disesteem for the structures of mediaval architecture." It is generally used to denote the modes in which all buildings of the Middla Ages were constructed, referring more parused to denote the modes in which all buildings of the Middle Ages were constructed, referring more particularly to those styles in which the pointed form of nrch was especially used. It is applied to all forms of English ecclesiastical architecture, from the 6th to the 17th century. (See NORMAN, SEMI-NORMAN, 117

## Architrave

EARLY ENGLISH, DECORATED ENGLISH, FLORID OR PERPENDICULAR ENGLISH, and DEBASED ENGLISH styles.)

Modern Architecture .- To the decay of the feudal system, and the subsequent suppression of the monas-teries by Henry VIII., may be traced the gradual decline and fall of Gothic architecture, until, in the time of Elizabeth, it had assumed a form which rapidly passed into what is called Debased English, in which the use of the arch was almost superseded by the adoption of the architrave. There was then a per-ceptible inclination to return to the old classic styles ceptible inclination to return to the oid classic styles of Greece and Rome, and this tendency splainly shown in the churches, museums, theatres, and other public edifices that have been erected since the reign of Charles I.; among which may be mentioned St. Paul's Cathedral, built by Sir Christopher Wren. In the or the Gothic style of architecture, which, although pre-eminently suited for buildings of an ecclesiastical character, is not well adapted for the construction of character, is not well adapted for the construction of public offices or private dwelling-houses, as the comfort of the interior is too often disregarded for the sake of the symmetry of the exterior. The architecture of every country and age must be adapted to the requirements of the times and general progress, and every building, whatever it may be, must be especially contrived to suit the purposes for which it is required; and, although it may be produced out of any of the styles of architecture that have freviously existed, it should never be designed with slavish adherence to the ascented rules for the construction of either of should never be designed with slavish adherence to the accepted rules for the construction of either of them, but to suit every needful demand for convenience and utility, modified in outward appearance, in all cases, to suit the locality in which it may be placed and the objects by which it may be surrounded. In exemplification of this, no better proof can be adduced than that peculiar form of building, always marked, and often picturesque in character, which has sprung, up since the unroduction of railways, and may, with up since the introduction of railways, and may, with propriety, be termed railway architecture. The more important architectural features will be found under their several heads (see ARCH, COLUMN, CORBEL, &c.);

their several heads (see Arch, Column, Corbel, &c.); while buildings of a particular nature (see, Amphitheatre, Basilica, &c.), and parts of buildings (see Basment, Roof, &c.), will also be separately described.—Ref. Bloxam's Gothic Architecture; Glossary of Architecture; English Cyclopadia—Arts and Sciences. Architecture; Maglo-Saxon.—The period during which this style of building prevailed in England extends from the arrival of St. Augustine, in 597, to the middle of the 11th century, or the Norman invasion. It is characterized by great simplicity. The following are its peculiar features:—The semicircular arch of brickwork similar to the arches of the Romans; the walls formed of rough masonry or rubble-work, with a walls formed of rough masonry or rubble-work, with a tie or bond of hewn stone at the angles, and narrow ribs of the same material running up the wall at intervals, dividing it into long and narrow sections resemvals, dividing it into long and narrow sections resembling panels; the doorways and recesses generally with semicircular headings, though many are found with headings of a triangular form, rudely constructed with long blocks of stone, inclined towards each other, and supported on imposts projecting over the jambs. The long blocks of stone, inclined towards each other, and supported on imposts projecting over the jambs. The belifty windows are also peculiar in form, consisting of two semicircular-headed lights, divided by a column resembling a rude baluster. They are distinguished from windows of the Anglo-Norman style of similar construction by the double splay of the jambs, the space from side to side of the whole aperture being narrow in the centre and becoming wider both towards the exterior and interior of the wall. There are many old churches in Northamotonshire, amone which may old churches in Northamptonshire, among which may be named those of Brixworth and Barnack, that afford excellent examples of the coclesiastical architecture of the Anglo-Saxons.—Ref. Bloxam's Principles of Gothio Architecture

Architecture.

ARCHITRAVE, ark'-i-traiv (Gr. arckos, chief; Lat. trabs, a beam), in Arch., the beam, or portion of the entablature that rests immediately on the columns. The architrave is a prominent feature in the Egyptian, Greek, and Roman styles of building: it was superseded by the arch in mediaval architecture. The use of the architrave and arch respectively forms the most striking point of difference between ancient archi-

tecture and the different styles of the Middle Ages. The architrave of a door is the moulding and woodwork surrounding the opening, the head being called the

distel, and the sides the jumbs.

ARCHIVES, ar'-kiess (Gr. archeia, public registries), strictly, the record office in which public papers and documentaare kept; but, by a common figure, the term is also applied to the papers or documents themselves. Some derive the word from area, 'a chest,' wherein the records, charters, and other papers and evidences of a state, house, or community, are preserved. The urchives of ancient Rome were in the temple of Satura. The principal depositories in England for public records are the Record Office, the Tower of London, and the British Museum. (See RECORDS.)

ARCH-LUTE, a large lute, or double-stringed by the

ARCH-LUTE.

orbo, formerly used by the Italians for the base parts, or as an accompaniment to or as an accompaniment to the voice. In Corelli's so-natas, the base staff is as-signed to the violone; i.e. double base, or arcilento. According to Kircher, this instrument was about five feet in length, and propor-tionately large in the body. It had fourteen notes, the highest whereof was A, the fifth line of the base; and the lowest, the double G below. It is supposed to below. It is supposed to have been invented in the 16th century, and, in the be-giuning of the last century, was much in use. Haudel himself employed it in several of his earlier operas. In the Chapel Royal, the office of lutenist still continues a part of the estab-lishment, although its duties have ceased for nearly a hundred years.

ARCHOGRAPH. CLOGRAPH.)

ARCHON, ark'-on, is a Greek term, signifying literally a ruler or commander, and was the title given by the Athenians to their chief magistrate. On the by the Athenians to their chief magistrate. On the abolition of the regal government in Athens, after the death of Codrus, the chief power was vested in his son Medon, with the title of archon. He held the office for life, and it was continued in his family for a considerable time. They were, however, responsible to the people for the acts of their government. In 752 n.c., the term of office was limited to ten years, and, in 714, the exclusive right of the Medon family to the office was abroarded and it was throw over the office was abrogated, and it was thrown open to all once was abrogated, and it was thrown open to all persons of noble birth. About 683 the duration of the archonship was limited to one year, and eight others were associated with him in a council of state, who were also termed archons. The first was called the archon, and had also the title of eponymos, or namegiver, because the year in which he served was named after him; the second was study head. after him; the second was styled basileus, or king, and had the care of religious matters; the third was polemarches, or commander in-chief; and the remaining six were styled thesmotheta, or lawgivers. Solon made the qualification of archon to depend not on birth, tiut on property; and Aristides abolished the property qualification altogether, and threw open the archon-ship and other magistracies to all the citizens. From the time of Solon downwards, the popular assembly continued to encrosch more and more upon the powers of the archons, who at length sunk from ministers of state into high municipal officers. They appear to have been originally elected by suffrage, the franchise being probably confined to the noble class from which being probably confined to the noble class from which they were taken. The right of suffrage was probably enlarged by Solon, and, in later times, the election was made by lot.—Ref. Smith's Dictionary of Greek and Roman Antiquities; English Cyclopadia.

ARCTIC AJA. (See TIGER-MOTH.)

ARCTIC, ark'-tik (Gr. arktus, a bear), in Astron., a crown applied to the north pole, or the pole raised place, from its being usually covered with sand. It is

above our horizon. It receives its name from the constellation of the Little Bear, the last star in the tail of which nearly points out the north pole.

ARCTIC CIRCLE, in Astron., a circle of the sphere paralleleto the equator, and distant from the north pole 23° 30′. This and its opposite, the Antarctic Circle, are also called the Polar Circles, wherein the largest day and because they have a three than the contract of the co longest day and longest night are 21 hours, and within which at one time of the year the sun never sets, and

which at one time of the year the sun hour, at the opposite season never rises.

ARCITE FOX. (See FOX.)

ARCITESTAPHYLOS, ark-tos-tiff-i-los, in Bot., a gen. of plants belonging to the nat. ord. Bricacea.
The species A. uva-uvsi, the common bear-berry, is In e species A. wa-urs, the common bear-perry, is found wild in the mountainous parts of England and Scotland, and generally over the whole of Northern Europe. It is a trailing shrubby plant, with leathery dark-green leaves. The flowers are white, tinged with pink, small, and in clusters; the berries small and red, resembling those of the hawthorn. The whole plant possesses astringent properties, and is sometimes used in tanning, and for dyeing a greyish black. The leaves are frequently employed as medicinal agents in those cases where vegetable astringents are required; they have also been used as an antidote in poisoning by ipecacuanha.

ARCTURUS, ark-tu'-rus (Gr. arktos, the bear, and oura, tail), a star of the first magnitude, in the constellation Boötes, or Arctophylax. The star is so called because it is situated near the tail of the Bear. It was supposed to be the nearest star to our system visible in the northern hemisphere; but this idea is now

exploded.

ARDEA. (See HERON.)
ARR, ar, the modern French measure of surface, which forms a portion of the new decimal system adopted in France. It is obtained as follows:—The adopted in France. It is cotained as 1010ws:—Into metre, or measure of length, being the 40,000,000th part of the whole meridian, as determined by the survey, is 3:2809167 English feet; and the are is a square, the side of which is 10 metres long. The hectare is gene-rally used in the measurement of land. It is 2:4711095

English acres; or 4012 hectares make 1,000 acres English measure.

AREA, air'-e-a, denotes the same thing as superficies, or quantity of surface; but is applied exclusively to plane figures: thus, we say, the surface of a sphere; the area of a triangle. The word is also used to signify any open space; whence in modern houses, that por-tion of a site which is not built upon is generally termed the area. I. Math., the measuring unit of every area is the square described upon the measuring unit of length: thus, we speak of the square inches, square feet, or square miles which an area contains.

ARECA, a-re'-ka, in Bot., a gen. of plants belonging to the nat. ord. Palmacea—the Palms, containing two species, each remarkable for the purposes to which it is applied. A. Catechu—the betel-nut palm, has been described as the most beautiful palm in India. The stem is remarkably straight, and often from 40 to 50 stem is remarkably subsigns, and notes from the confect high, and generally about 20 inches in circumference. It is cultivated throughout India for the sake of its seeds, which are known as betel, areca, and pinang nuts. The nut is one of the ingredients in the pinang nuts. The nut is one of the ingredients in the famed masticatory of the East called betel (which see). Charcoal prepared from the nuts, and termed areca-nut charcoal, is used in this country as a tooth-powder; but it is doubtful whether it is in any way superior to ordinary charcoal. An extract is made from the nuts in the south of India; and this constitutes one of the commercial varieties of catechu (which see). The timber the leaf staller and the matter that the contractions of the commercial varieties of catechu (which see). The timber, the leaf-stalks, and the spathes of this palm are timier, the seat-states, and the spaties of this post and made use of for various purposes; and in Malsbur an inebriating beverage is prepared from the sap. A. oberacea, the cabbuge-palm, is a native of Jamaica and other West-India islands. The trunk, which is seldom observed, the cumple-paint, is a matter of a consider of the thirds is laint's. The trunk, which is seldom more than six or seven inches in dismeter, grows to a height of from 100 to 200 feet. This majestic palm is frequently cut down for the sake of the single terminal bad, called the cubbage, which is esten either raw or bailed as a wagetable.

### Arenaceous

now frequently used in a general sense to denote a place where any contest or display of power takes

ARENACEOUS ROCES, de e - nai'- shus (Lat. arena and), in Geol, are those composed of grains of said, or which contain sand in any notable degree, as grits and sandstones. Compound rocks containing sand are termed Arenacce-arithmosely Arenaceo-calcarsous, and so on, according to their composition.

ARENG. (See GOMUTO.)

ARENGOLITES, är'-en-i-ko-lites, in Geol., a term applied to circular holes or markings which have been observed on the upper surface of many sandstones, and which are supposed to have been worm-burrows, like those of the arenicols or lob-worm.

ARKOLA, dire'-o-lä (Lat., a small open space of circle, diminutive of area), in Anat. and Physiol., is applied to the small interstices of minute cellular or other tissues, through which the smallest vessels and nerves . It is also applied to the small red or brownish กลระ circle which surrounds the nipples of females, or the ring which surrounds the pustule of small or cownoë.

AREOMETER, ar-s-om'-c-ter (Gr. araios, thin, metreo, I measure), a term sometimes applied to the instrument commonly called hydrometer. (See Hydrometer, a term sometimes applied to the instrument commonly called hydrometer. (See Hydrometer, a term of the hydrometer), are open of the hydrometer and the instrument of the hydrometer of hydrometer of the hydrometer of hydrom

Mary), was the name of a nil or rocky eminence ying to the west of the Acropolis at Athens, and was the place of meeting of the chief court of judicature of that city, hence called the Council of Areopagus. It was of very high antiquity, and existed as a criminal tribunal loug before the time of Solon. He, however, so far changed its character and constitution, as to be in some measure entitled to be called its founder. He in some measure entitled to be called its londer. He enlarged its sphere of jurisdiction, and gave it extensive powers of a censorial and political nature. He made it to consist of exarchors, who had passed with credit the acrutiny they were subjected to at the termination of their period of offlice. As a court of justice it took cognizance of capital crimes, as murder, arson, &c.; and it also exercised a certain control over the ordinary courts. Its censorial duties were of a very extensive and inquisitorial nature, for the preservation of order and deceney. Religion was also within its jurisdiction, and impiety in any form was punished by it. Pericles succeeded in greatly diminishing the power of this council, and deprived it of many of its hereditary powers. It still, however, seems to have retained a great degree of power; but in later times, retained a great degree of power; but in ager times, when corruption of manners came to presail among the people, it necessarily pervaded also the members of the council, which thus, in a great measure, lost its moral influence and authority; but it continued to exist down to a very late period. Some hold that the apostle Paul was taken before this council; but the Scripture does not bear out this idea. It seems rather that the Athenians had taken him to the hill in order to hear him expound his new doctrines.

to hear him expound his new doctrines.

ARGALA LEPTOPTILOS. (See ADJUTANT.)

ARGALA LEPTOPTILOS. (See ADJUTANT.)

ARGALA (Oris Ammon), in Zool., a species of wild sheep inhabiting the mountains of Siberia, Kamschatka, and the higher regions of the Himalayas. Dr. Hooker, in his Himalayan Journal, thus describes the animal:—"We came suddenly upon a flock of gigantic wild sheep feeding on scanty tufts of dried sedge and grass: there were twenty-five of these enormous animals, of whose dimensions the term when gives no idea they are a learned at the second standard and the second standard at the second second standard at the second sec onormous animus, of whose dimensions the term sheep gives no idea; they are very long-legged, stand is high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when deteched and bleaching on the barren mountains of Thibet." The horns of the male of this species of wild sheep are about 4 feet in length and 14 inches in circumference at their triangular-shaped

14 mones in circumterence at their triangular-shaped base. The name of the nuimal is Mongolian. The Rocky-Mountain Sheep, or Big-horn, has also been termed the American Argaii. (See Sheke).

Angand Lamp, ar-gand, a kind of lamp invented by M. Argand, a Frenchman. It consists essentially of a reservoir, from which proceeds a tube carrying the oil to the burner. The burner is a cylindrical tube, within which is inserted another tube of similar form, the diameter of which is a curatter of an inch loss the diameter of which is a quarter of an inch less tart in sma than that of the outer one. Between these two is of Tarran.) Argol

placed the wick, which is also tubular, and can be raised or lowered by means of a screw or rack. To the lower part of the burner is screwed a cap to prevent the oil falling through, but with holes in the upper portion to allow the air to pass upwards. A glass tube with a shoulder is fitted over the burner, and creates a draught both inside and outside the wick, which is still further concentrated upon it by means of the shoulder inst mentioned. The draught means of the shoulder just mentioned. The draught causes an increased supply of oxygen, and consequently a more complete combustion and a brighter flame. The same principle is applied to gas. Dr. Frankland has lately contrived an argand burner in Frankind has lately contrived an argand burner in which the air passes the heated portion of the glass tube before reaching the flame, which thus becomes supplied with hot air instead of cold. This contrivance effects a saving of 50 per cent. of fuel, whether oil or gus. Efforts have been made to construct candles in this way, but as yet without success. Furnose made on the argand principle—i.e. with streams of air introduced into the centre of the flame—are now much need in metallurgical operations. used in metallurgical operations.

used in metallurgical operations.

ARGEMORE, ar-gen'-o-nc, in Bot., a gen, of plants belonging to the nat. ord. Papaverace, the Poppy family. A mexicana, the Mexican or gamboge thistle, is an annual herbaceous plant, with large yellow flowers, and sessile, waved, and sinuated spiny leaves. It is a native of Mexico, but is cultivated in England and other parts of Europe as an ornamental plant. The seeds possess narcotic and purgative propertica, and an oil is obtained from them which has been recommended as a remedy for cholers. In the West Indies the seeds are used as a substitute for ipecacu-

anha.

ARGENT, ar'-jent (Lat. argentum; Fr. argent, silver), in Her., a term from the French, to express the metal silver in armorial bearings. It is generally left white in the fields and charges of all coats of arms, whether coloured or engraved.

coloured or engraved.

ARGENTAN, \*\*r-jen'-bin, German silver, 2 parts of copper, 1 of nickel, and 1 of tin.

ARGENTIFEROUS, \*\*ar'-jen-bij'-e-rits, silver-bearing.

Applied to minerals, veine, or metals containing silver-ARGENTIE, ar', jen-lite, one of the most important ores of silver. It is occasionally found in crystals, but more frequently in malleable blackish lead-coloured masses. It is found in granite and porphyry, in different parts of the world, and consists of 86 parts of silver to 14 of sulphur,

ARGENTOMETER, ar-jen-tons'-c-ter (Lat. argentum, silver; Gr. metron, a measure), a graduated cylindrical glass vessel employed for ascertaining the amount

of silver in a certain solution.

ARGENTEM DET, ar-jen'-tum de'-i (God's penny), was anciently the name given to earnest-money, or money given to bind a bargain. In some places it is called artes, or ertes, and by civilians and canoniste,

arrhæ,

ARGIL, or ARGOIL, ar'-jil (Gr. argillos, a white pure earth, from argos, white), clsy, lime, and sometimes gravel; also the lees of wine gathered to a certain hardness.—Ref. Law, Fr. Diet.; Cowell; Blunt.

ARGILE PLASTIQUE, ar'-sheel plas-teck (Fr., plastic clay), in Geol., the term applied to extensive deposits of sand, with occasional beds of clay, used for pottery, near the base of the tertiary system in France.

ARGILLACEOUS ROCKS, ar-jil'-lai'-she-us (Lat. argillow) in Geol.

ARGIDIACEOUS MOCKS, ar.jut.-lat.-she-us (Lat. argilla, cisy), in Geol., are those composed of clay, or having a notable proportion of clay in their composition; as roofing-slate and shale. All such rocks emit a peculiar odour when breathed upon. Compound clayer rocks are described as argillo-calcarcous, argillo-arcaccous, and so on.

ARGO, or ARGO NAVIS, ar-go, the ship Argo, a constellation, the greater part of which hes in the southern hemisphere. It is of considerable extent, and is divided by astronomers into four parts or regions.

Augor, ar'-gol, the crude tartar which is deposited

ARGOL, ar-got, the crude tarear which is by all wines as a crust upon the inside of the casks in which they are stored. Argol is the source from which are obtained tartaric acid and common cream of tartar, which is a tartrate of potash. Argo is dissolved in hot water, which, when cold, deposits the cream of tarter in small oblique rhombic prisms. (See CREAM

## Argonauta

ARGONAUTA. (See PAPER-NAUTILUS.)

ARGONAUTIC EXPEDITION, ar-go-naw-tik, in the Anc. Hist. of Greece, is an event frequently referred to by ancient writers; but the accounts given of it are very different. Generally it was an expedition under-taken by Jason in the ship Argo, to bring back the golden flesce from Colchis, and is usually said to have taken place about the middle of the 13th century before

ARGOSIE, arr-go-se, is a name given by old writers to a ship of great burden, whether for war or commerce. It occurs in Shakspere, Besumont and Fletcher, and others, and was probably derived from Argo, the name of the vessel in which Jason sailed in quest of the Calder Flaces. Golden Fleece.

ARGUMENT, ar'-gu-ment (Gr. argos, clear; Lat. argumentum), signifies properly that through which a conclusion is established; or, generally, it means any piece of reasoning expressed in intelligible language. a. Logicians have divided arguments according to their forms, into syllogisms, enthymemes, inductions, &c.; and specially recount various kinds of arguments which are usually reckoned as fallscies, but which are not necessarily so. They can only be accounted sophistical when they are employed with the intention to deceive the listener; that is, when they are unfairly used. Such are the argumentum ad hominem, or personal argument, where an appeal is made to the peculiar character and opinions of the opponent; the argumentum ad verecundiam, or appeal to our sense of reverence for some respected authority, or for some venerable institution; the aryumentum ad populum, where an appeal is made to the prejudices and passions of the crowd; the argumentum ud rem, or ad judicium, which bears directly upon the real question at issue. b. Rhetoricians again divide their arguments with respect to the topics from which they are drawn, irrespective of whether they are logically classified or not. These arguments are usually divided as follows:—1. Into regular and irregular; 2. into probable or moral, and demonstrative or nece sary; 3. into direct or indirect (the latter is largely used by geometricians as the reductio ad absurdum); 4. into those from example, from testimony, from cause to effect, from analogy, &c. Many of these rhetorical arguments will be found, on examination, to contain each other; but this the rhetorician does not regard, as his business is to touch the feelings of his audience, and not properly to convince them, which is the sphere of not properly to convince them, which is the sphere of the logician. c. The argument prefixed to a book, as to one of the divisions of Milton's Paradise Lost, is that which shows the purport or contents of it: and the same holds good for the devices on shields, &c., as the buckler of Milton's rebel angel, which was "ravious with boastful argument portraid." d. Lastly, an argument in astronomy is a quantity upon which an equation of these comments are radiating to the rection. tion or other circumstance relating to the motion of a planet depends.—Ref. Whately's works on the Art of Logic.

ARGUS PHRASANT, art-gus (Argus giganteus), a rare and beautiful bird, native of many parts of the Indian islands. The adult male measures between five and six feet in length from the beak to the extremity of the tail, and the plumage is wonderfully varied and

ARIADNE, ar-i-ad'-ne, one of the asteroids, or group of small planets, revolving between Mars and Jupiter, (See ASTEROIDS.) It is the forty-third in order of discovery, and was first noticed by Mr. Pogson, at Oxford, April 15, 1857.

ARIANS, air'-i-ans, a name usually given to all who adhere to the opinions advanced by Arius, a bishop adhere to the opinions advanced by Arius, a bishop of Alexandria, respecting the relation of the Father and the Son in the Holy Trinity. Athanasius alleges, in his second oration (§ 24), that Eusebius of Nicomedia and Asterius agreed with Arius in maintaining that God, being willing to create the universe, and seeing that it could not be subject to the working of his Almighty hand, made first a single being, whom he called Son, or Logos, to be a link hetween God and the world, by whom the whole universe was created. In other words, the followers of Arius maintain that Christ, the son of God, is the most exalted of all created things, but inferior to God the Father, and produced by his free will. The opinion itself was first broached about 318 A.D., and it was

## Aristocracy

publicly condemned at the council of Alexandria, which was held in 320 A.D., and in the council of Nice, which was held in 325 A.D. The orthodox church maintained the perfect equality of essence of both Father and Son, and could only express their relation by terming it eternal generation. The articles of both the Nicene and the Athanasian creeds arose out of this great Arian controversy. Arius and his party were banished by the former council; but as he had powerful adherents, he soon found means to return, at the express command of the emperor Constantine. He was on his way to receive the oath of ministerial allegiance to the orthodox views of the church at Constantinople, when he died, very suddenly, some said by poison, in 336 A.D. His followers gained great accessions after his death, and the emperor Constantino is said to have been baptized into the Arian communion a short time before his decease, in 337 a.D. Under Constantius, Arianism became the religion of the court; and it penetrated as far as Rome, which was obliged to receive into its communion an Arian bishop, Felix. But the divisions among the Arians themselves prepared for the Catholic church an easy victory over them, and led to their final extinction. The first split in the Arian faith took place in the western part of the Roman empire, where all opponents of the doctrine of Athanasius, that the Son was homeousies, or of the same essence with the Father, were called Arians; but some of these opponents clung to the doctrine already taught in the school of Origen, that the Son was homoiousies, or of similar essence with the Father. Those received the name of Semi-Arians; but the secti broke up into some ten or twelve separate communions before it finally disappeared from the history of the Church. But the Arians made a bold struggle for existence. They ascended the throne with Valens, in 304 A.D.; but Theodesius hurled them to the ground, and restored the dominion of the ancient church. The creed was altogether extinct in the Roman empire at the beginning of the 5th century. It continued to flourish among the Goths, the Suevi in Spain, the Burgundians, the Vandais, and the Lombards, among birgunatas, the vancais, and the Lombaras, among which latter people it survived down to 662 A.D. In England the doctrine was partially revived by Dr. Samuel Clarke and by William Whiston, and may still be occasionally met with in certain remote corners of society; but, generally, the name Anti-Trinitarians, or Unitarius, is preferred to the old creed of Arianism, which both of those sects profess

ARIES, air'd-ces (Lat., a ram), the first of the twelve signs of the zodiac, and a constellation giving its name to a space of 30° of the ecliptic, which the san enters in March, measured from the vernal equinox. Owing to the constant change of the position of the vernal equinox, arising from the precession of the equinoxes, the sign Aries no longer corresponds with the constellation of that name, but has moved about

30° to the westward of it.

Arillus, ü-rill-lus, in Bot., the term applied to an integument which is occasionally found covering, wholly or partially, the testa, or outer coat of a seed. The seed of the Passion-flower exhibits this covering, which commences at the base and proceeds towards the apex. In the nutmeg, the additional coat proceeds from above downwards, and constitutes the substance called mace, which is extensively employed as a spice.

ARIBEMA, "ir-i-se'-m", in Bot., a gen. of plants belonging to the nat. ord. Arace, the Arum family. The species A. atrorubeus, Dragon-root, or Indian Turnip, is a native of North America. From the tuber a nutritious fecula is obtained. In medicine, the tuber is also occasionally used, being given internally as a stimulant in rheumatism and bronchial diseases, and being also employed as an application to apthous affections in children.

Arista, or Awn, "-ris'-ti, in Bot., a solitary pointed bristle, growing in the flower of a grass, either from a

oristic, growing in the flower of a grass, either from a glume or from a palea. (See Graminaceze).

Aristocracy, är-is-tok-rà-se (Gr. aristokratia, the rule of the best; from aristos, best, and krateis, to rule), in its original acceptation, denotes that form of government in which the ruling power is vested in the best men, whether by birth, wealth, or personal distinction. Personal excellence, however, was usually regarded as

## Aristotelian Philosophy

a necessary element in the character of those consti-tuting an aristocracy. It was opposed to oliqurchy, which was regarded as a perversion of aristocracy, and in which the dominant power was in the hands of a few, who ruled for their own advantage. In the idea of who ruled for their own advantage. In the idea of aristocracy, therefore, was included that the administration of affairs should be for the general good, and not for any one class. In modern times, those governments have usually been termed aristocratic in which named privileged class of noble or wealthy persons either governed absolutely or shared the government, in various proportions, with the sovereign or the people. In a more general sense, it is applied to any form of government in which a minority of adult males congovernment in which a minority of adult males constitute the ruling class; and is opposed to democracy, in which the ruling power is vested in a majority of adult males. Lord Brougham's definition is somewhat different. "Where," says he, "the supreme power in any state is in the hands of a portion of the community, and that portion is so constituted that the rest of the people cannot gain admittance, or can only gain admittance with the consent of the select body, the government is an aristocracy; where the people at lurgo exercise the supreme power, it is a democracy. Nor does it make any difference in these forms of Nor does it make any difference in these forms of government that the railing body exercises its power, by delegation to individuals or to smaller bodies. Thus, a government would be aristocratic in which the select body elected a chief, to whom a portion, or even the whole of its power, should be intrusted. Sometimes the word eristocracy is applied not to any form of government, but to a particular class of persons in whate. In this sense it was nover used in ancient in a state. In this sense it was never used in ancient times; but it is common with modern writers. The f rmer distinction is dropped, and an aristocracy in this sense is not necessarily connected with the government, and may exist under any form of rule. It is in this way sometimes used as synonymous with nobility; in a wider sense, it is applied generally to the rich as distinguished from the rest of the community.

ARISTOLOCHIACEE, u-ris'-to-lo-ki-ui'-se-e, in Bot., a nat. ord. of plants of the class Dicotyledones, sub-class Monaclamydea, consisting of herbs or shrubby climbers, which are sparingly distributed in several parts of the world, but are very common in the tropical portion of South America. There are nine genera and 130 species. The typical gen. Aristolochia, Birthwort, is species. The typical gen. Aristologial, Birthwort, is distinguished by a tubular oblique periauth, generally inflated at the base, the mouth diluted on one side, and by stamens adherent to the style. Several species of this genus have been employed for centuries in of this genus have been employed for centuries in medicine, principally on account of their supposed commenagogue properties; and hence the name Birth-wort. The roots of A. longa, A. rotunda, and A. cle-matitis are most commonly used. They have all stimulant and tonic properties. The powdered root of A. longa is one of the ingredients in the duke of Portland's powder for the gout. A. anguicida is supnesed by Lindley to be the celebrated guaco of the Columbians. The juice of the root is said to stupefy snakes, so that they may be handled and played with. The rhizome and root-fibres of A. serpentaria, commonly called serpentary, or Virginian snake-root, are officinal. Serpentary was originally introduced as an antidote to snake-bites, but it is now known that it has no efficacy in such cases. It is a valuable stimuhas no checky in such cases. It is a vanuance some last, tonic, and disphoretic, and is especially useful in fevers of a low or typhoid character. The roots of A. reticulata, A. tomentosa, and A. hastata are said to be mixed in commerce with those of A. serpentaria. Several species of this important genus are cultivated in bothouses as ornamental plants.

Austrotella, ir-is-lo-le-li-n, in Bot., a gen. of plants belonging to the net. ord. Thiacce, the Lime-tree or Linden family. The most important species is A. Macqui, which produces an edible fruit, from which a

hind of wine is prepared.

Aristotelian Philosophy, ar-is-to-te'-li-an, is one of those systems of speculation which arose from the teachings of Socrates, and which, from the unity and grandeur of the genins of its founder, took a strong hold of the mind of Greece, and, since the revival of letters, of Western Europe. Aristotle attempted in his philosophy to steer a middle course between the high ideality of his master Plate and the low sensa-

tionalism of the physical school of Eles. It is said that he listened to Plato's lectures in the Academy for twenty years; that Plato was accustomed to call him, twenty years; that risto was accustomed to call him, by way of eminence, "the Thinker;" and that he was of small stature, and vain of his personal appearance. Whether the latter facts can be substantiated or net, he was unquestionably, perhaps, the forement scientific thinker that ever lived. His genius was wide as nature. the studied everything, and seemed to know everything better than every other body. His knowledge was quite amazing; and he extended the boundaries of science almost to an encyclopadic extent. Abstract science almost to an encyclopedic extent. Abstract science and physical science—nothing came wrong to him. His genius was at once lofty and minute, highly speculative and curiously detailed. Aristotle combated with much keenness the ideal theory of Plato, or that which expounded the Deity as holding in himself the archetypal ideas after which the world was fashioned, and which it was the business of Reason and Science to discover. But, while denying these ideas of his master, he nevertheless agreed with him in the view, that knowledge contains an element radically distinct. that knowledge contains an element radically distinct from sensation. He differed again from the Eleatics and the Epicureans, inasmuch as he denied that sensa-tion could account for the whole of knowledge; but maintained, with them, that without this sensation, knowledge would be impossible. The celebrated maxim, that "there is nothing in the intellect which was not previously in the sense," if not Aristotle's, at least expressed well a side of his doctrine; but, when he insists upon the distinction between the necessary rises altogether above the sphere of Sensation, and and the contingent, the absolute and the relative, he takes his place emphatically with the Reason. Thus he steered a middle course between what he regarded as the Scylla and Charybdis of speculation,—idealism and sensationalism; but in what precise line he moved is by no means clear. He nowhere has expounded his doctrines, and he is very charry of definition; so that no two Aristotelians of the present day are agreed respecting the details of his philosophy. Perhaps the best characterization of it is to say, that it was a system of empiricism, or one bused upon experience, modified, often considerably, by the rationalism of Plato. The language in which his philosophy is couched is brief, pregnant, and poculiar; and his system not only has afforded a test of the critical acumen of those who have taken to studying him, but it has afforded, besides, a nice test of advancement in the knowledge of the Greek language, to read Aristotle with intelligence and promptitude. Philosophy, according to Aristotle, is properly science arising from the love of knowledge. There are two sorts of knowledge, -mediate and immediate. From immediate knowledge, which we gain through the experience of particulars, we derive mediate knowledge, by means of argumentation, whose theory it is the office of logic properly to expound. Logic is therefore the instrument of all science; but only quoad formam, for it is experience which supplies the matter to be worked upon. The formal part of reasoning he accordingly expounds better than any man either before or since his time. He created logic indeed; and this system stands erect through the crumbling waste of centuries, like an Egyptian pyracrumbling waste of centuries, like an Egyptian pyramid, which heat and moisture cannot wear away. He nowhere defines logic; but the book which contains it is ordinarily called the Organon. His successors have only damaged when they have tried to improve his system of argumentation; and, down to the period of Sir William Hamilton, it remained nearly destitute of a single modification or addition. He bases his logic most profoundly upon the laws of contradiction, and of excluded middle, and he even recognizes that of sufficient reason as a registry entirely in the evolution of truth. After logic hat control recognizes that of summers reason as a regi-lative principle in the evolution of truth. After logic he took up nearly all the sciences, rational, empirical, and mixed, except one alone; viz., history. Ho acems to have divided philosophy into logic, physics, and ethics, or into speculative and practical knowledge. ethics, or into speculative and practical advances.

I. Speculative philosophy contemplates the roal order of things, irrespective of human control; practical philosophy deals with affairs voluntary and accidental. Real substances are either invariable or variable; while sublunary affairs are variable and perishable; the Deity of the property of th alone is imperishable and unchangeable. Do men pur-

121

are the real in an abstract way? Then (ta meta ta phusika) Metaphysics and Mathematics emerge. Do they pursue knowledge as to its objects? Then Physics, Cosmology, Psychology, and Theology emerge. 2. Practical philosophy again comprehends Ethics, Politics, and Economy. A word or two on each of these heads; and, first, of Speculative Philosophy. I. Physics, or natural philosophy.—Nature is the sum of all existences which are disclosed to us by our perceptive faculties. The knowledge of mature is properly the knowledge of the laws of bodies in motion. Nature, cause, accident, end, change, infinitude, space, time, and motion, are included in this science. The three elements of existence are matter, form, and privation; and change is possible as respects substance, quantity, quality, and place. Motion, like time, has neither beginning norend; and the first thing to which motion was applied was the heavens. In his Cosmology Aristotle discusses astronomy, using that term in its widest signification. It appears to the modern reader obscure and inconsistent, and is by no means satisfactory. Physiology is sistent, and is by no means satisfactory. Physiology is indebted to Aristotle for its first essay. The soul is, The soul is, according to him, the active principle of organized life. It is distinct from the body, yet, considered as its form or entelecly, it is inseparable from it. Its faculties are production, nutrition, sensation, thought, and will, or impulse. His remarks on the principle of Common Sense, on Consciousness, on Imagination, on Memory, and on Recollection, nearly all of which he was the first distinctly to recognize, are very valuable, and will repay a careful perusal even at the present day. Metaphysics, or, more properly, the first philosophy, according to Aristotle, is his attempt to science Being in the abstract. The leading characteristics of the latter existence he analyzes into the ten categories of substance, quantity, quality, relation, time, place, situation, possession, action, passion. With this arrangement he connected the question of the First Being, rangement he connected the question of the First Being, whose felicity is alone complete, and whose existence is alone immutable. II. The ruling idea of his Practical philosophy was that of a sovereign good, and final end or aim of action. This final end he denominated happiness, which is the result of the perfect energies of the soul, and is the highest of which our nature is capable. It arises from the perfect exercise of reason, and is ordinarily called virtue. This had describes as and is ordinarily called virtue. This he describes as the mean between two extremes, which is the character of nearly the whole of his philosophy. He distinguishes the moral virtues into the seven cardinal ones, of which Justice, in a sense, embraces all the rest. Under the head of Right, he distinguishes that belonging to a family from that belonging to a city. A perfect unity of plan reigns throughout his Morals, Politics, and Economics. Both of the latter have for their object to show how this perfect virtue, already described, may be attained in the civil and domestic relationships, through a good constitution of the state and the household. The principle of the science of Politics'is expediency, and its perfection consists in the suitableness of means to the end proposed. By this principle Aristotle proves the legality of slavery; sud all educa-tion he refers to the ultimate end of political society. Of Aristotle's successors, the only one deserving to be mentioned is Theophrastus, author of the Characteristics. This system long maintained its ground as distinct from that of Plato. In the Middle Ages it distinct from that of ratio. In the latitude lages in became degraded into a noxious system of barren formularies, which were in the end swept away by the revival of Platonism. All except his Logic, which will live for ever, is now nearly forgotten, except by a few

devoted students.

ARTHMETIC, d-rith'-me-tik (Gr. arithmetike, derived from erithmes), the science of numbers, or that portion of mathematics concerned with the properties of numbers. Every number is a ratio or relation ; that is to say, every magnitude, compared with another magnitude, is either equal, or greater, or less, and, therefore, has a certain relation to that with which it therefore, has a certain relation to that with which it is compared. Arithmetic is the art of combining these relations with one another, using for the purpose the signs themselves, by which the numbers are distinguished; thus, the four operations of addition, subtraction, multiplication, and division, include the entire science. For the facilitating of calculations and for commercial purposes, other useful rules have been

invented; such as proportion, interest, discount, decimals, extraction of roots, &c.; but they are but different applications of the four elementary rules. The origin of arithmetic is extremely obscure. According to Plate and Diogenes Laertius, arishmetic and geometry are of Egyptian origin; on the other hand, Josephus affirms, that Abraham, during his stay in Egypt, taught the inhabitants the use of numbers. The precise epoch in which numerical signs and the first methods of computation and calculation were discovered, is enveloped in equal mystery; but there can be little doubt that the decimal system, or method discovered, is enveloped in equal mystery; but there can be little doubt that the decimal system, or method of calculation by tens, originated from the custom of children reckoning by the fingers. (See DECIMALS.) Arabias philosophers were of opinion that it was from the people of India, during the alt or 10th century, that they borrowed the signs which we call Arabic, but which they call Indian numerals. It was not till the commencement of the 18th century that the science of arithmetic became disseminated in Europe. The Greek monk Planude, John Halifax, better known under the name of Sacro Bosco, and, since the invention of printing. Planude, John Halliax, better known under the name of Sacro Bosco, and, since the invention of printing, Lucas de Burgo and Nicolas Tartaglis in Italy, Clavius and Ramus in France, Stifelius and Henischius in Germany, and Buckley, Diggs, and Recorde in England, may be cited as the principal European arithmeticisms at the first dawn of the science. The employticians at the first dawn of the science. The employ-ment of the Arabic or Indian numerals, and the facilities afforded by algebra, have been the chief causes of the immense progress and development of modern mathematical calculations. (See ALGEBEA.) Arithmetic acquires several distinctive appellations from the particular manner in which it is used.—Decimal Arithmetic requires a series of ten characters, the Triamette requires a series of our enancers, the progression proceeding according to the powers of 10. The invention of decimal fractions, which has doubled the practical efficiency of our arithmetical system, is generally ascribed to Regiomentanus.—Duodecima!
Arithmetic, in which the multiples and divisors of unity proceed according to the powers of 12. This method is commonly used by artificers.—Political Arithmetic is the application of arithmetic to researches connected with the government of a country; such as its number of inhabitants, produce of soil, quantity of food required for consumption, &c.—Universal Arithmetic is the term applied by Newton to algebra, or the calcula-

tion of magnitudes in general.

ARK, NOAH'S, ark, the name given to the vessel built by Noah for the preservation of himself, family, and the several species of animals during the Deluge. Much labour and ingenuity have been spent in attempting to determine the form, size, materials, &c., of the ark, but with very little result. As it was not intended for sailing, but neerly to float idly upon the waters, there can be little doubt that its form was not that of a ship, but rather of a large floating house. We are told that it was 300 cubits in length, 50 cubits in breadth, and 30 cubits in height; but, from the great variety of measures of this name, it is impossible to determine its dimensions with any degree of certainty. It was made of gopher-wood, pitched within and without with pitch, and had three stories. It contained, besides the eight persons of Noah's family, one pair of every unclean beast and seven pairs of every clean beast, and of fowls of the air also seven pairs, (See DELUGE.)

ARE OF THE COVENANT, in the religious ceremonial

of the Jews, was a box or coffer of shittim-wood, made by Divine direction by the children of Israel in the by Divine direction by the children of Israel in the wilderness, and afterwards deposited in that part of the temple called the Holy of Holies. It was of an oblong form, two cubits and a half in length, and a cubit and a half in breadth and height; that is, according to the common estimate of the length of a cubit, 3 feet 9 inches in length, and 2 feet 3 inches in breadth and height. It was overlaid within and without with pure gold, and had on its upper surface a crown or border round about. At each of the four CORDETS WAS a rine of pure gold, into which were corners was a ring of pure gold, into which were inserted the two staves of shittim-wood, overlaid with gold, by which it was borne, and which remained there perpetually, even after it was deposited in the temple. The lid or cover of the ark, called also the Mercy-seat, was of the same length and breadth, and was made of

#### Arm

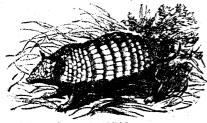

ARK OF THE COVENANT.

There was nothing within the ark save the two tables of stone on which were inscribed the ten command-

ARR, arm (Lat. brackium), is that part of the upper extremity of the body which extends from the shoulder to the wrist. It consists of two portions,—the arm, or brackium, properly so called, and the fore-arm, or anti-brachium; the former having one humerus: the latter two bones,-the radius and ulna. (See ANATOMY.)

ARMADA, ar-mai-da, or ar-mai-da, a Spanish word, signifying a naval armed force or fleet of war, but specially applied to the great Spanish fleet sent by Philip II. of Spain against England in 1588. It was composed of 150 vessels, carrying 2,650 guns, and having on board 20,000 soldiers, besides volunteers, and 3,000 scamen. It was styled by the Spaniards the "Invincible Armada." This vast armament was dispersed, and almost entirely destroyed, by the English Councia

ARMADILLO, ar-ma-dil'-lo (Dasypus), a gen. of mam-miferous quadrupeds, intermediate between the sloths and aut-eaters, and characterized by the possession of molar teeth only. Instead of hair, the armadillos are covered with a species of hard bony crust, forming three bucklers, on the rump, shoulder, and bead, respectively; the two latter being connected by a number of transverse movable bands, very similar in form and

ARMADILLO.

appearance to the plate-armour of the Middle Ages, from which, indeed, these animals have acquired their name of armadillos;—a name of Spanish origin, and a knight, baron, or other warrior, who was clothed adopted by English writers. The anterior surface of from head to foot (Fr. cap-a-pie) in armour, and was

## Armed at all Points

beyond the reach of the hunter, who has no other resource but to smoke out his obstinate game. Once brought to the surface, however, the animal becomes an easy prey, as its only defence is to roll itself up bedgehog-wise, and swait an assault. They are, however, by no means easily unkennelled, and have been known to allow a bunter to hack their tells off while they held on in the their tails off while they held on in the depths of their burrow by their powerful claws. The suimal never attempts to bite any one by whom it is attacked. Its food consists of roots, fallen fruits, and worms. Azara informs us that where armadillos abound, ants are sure to be scarce, as the animals break into the ant-hills and devour the insects as greedily as the ant-eater itself. It will not reject carrion, and has no soru-ples about violating a human grave, should an opportunity occur. The tropical and temperate regions of South America are the original and proper habitat of all the known species of the armadillo.

ARMAMENT, ar'-ma-ment (Lat. arma, throne of God, while the ark itself was his footstool, arms), denotes a force equipped for war, either naval. There was nothing within the ark save the two tables or military. It is also applied to weapons of war em-

ployed either in sea or land service.

Armanur, arm'-a-ture (Lat. armanur, armour), in Phys., a term applied to a piece of soft iron affixed to the extremities or poles of a magnet, in order that its magnetic power may be preserved; for when a magnet is allowed to remain long without an armature, a considerable diminution of its strength takes place, owing to the disturbing influence of terrestrial magnetism. (For an explanation of this phenomenon, see MAGNET, MAGNETISM.)

ARMED AT ALL POINTS, a term which, in the military language of the foundal age, was given to

ARMED AT ALL POINTS.

### Armenian Church

also provided with every weapon necessary for attack. Thus perfectly equipped for either defence or offence, the was said to be armed at all points. (See ARMOUR, and the respective terms there mentioned.)

ARMENTAL CHURCH, or me'nica, is a term applied to that section of the Christian Church which was established in Armenia. As early as the 2nd ceptury Christianity is said to have been introduced into the country, by the exertions of Bishop Gregory; and in the 5th century, by the exertions of Bishop Gregory; and in the 5th century the Bible was translated into the Armenian language by Miesrob. In the controversy respecting the two natures of Christ, the Armenians declared for the Monophysites, and formed themselves into a separate church, which they termed the Gregorian, after Bishop Gregory. They believe that Christ had only one nature, and that the spirit proceeds alone from the Father. They hold the "seven secraments;" but in baptism, with which they conjoin confirmation, they sprinkle three times, and dip as often. At the communion they see pure wine and leavened bread. Extreme unction is only administered to ecclesiastics, and that immediately after, and not before, death. They believe in the worship of saints, but not in purgatory. The head of the Church, called Cutholikos, resides at the monastery of Etschmiadzin, near Erivan; and to this place must every Armenian perform a pilgrimage once in his life. The secular pricests must marry once, but are not allowed to have a second wife. The Armenians, as a body, have always resisted all the attempts of the Roman Catholics to become united with them; yet there are certain of them in Italy, Poland, Galicia, Persia, and some parts of Russia, that have come under the papai supremacy; but they still have their own form of church government. From the wide dispersion of the Armenians, their doctrines are considerably different

ARMENIAK LITERATURE dates from the introduction of Christianity into the country, and its most flourishing period was from the 4th to the 14th centuries. Their writings are chiefly theological works and chronicles, and a great part of them are translations of Greek and Syrian authors, some of which are now only preserved to us through the Armenian; as the Chronicle of Eusebius; some of the writings of Philo; homilies by Chrysogtom, Severianus, and Basil the Creat, &c. The Bible, which was translated by Miesrob and his scholars, a.D. 411, is still regarded as the finest specimen of the classic style. The best edition is that published at Venice, 1805. Of Armenian historical and geographical works, several have been preserved to us. The most important theological and philosophical authors are David, the translator and commentator of Aristotle, and Esnik, both of whom flourished in the 5th century; Joannes Ozniensis, in the 8th; Nerses Klajensis, in the 12th; and Nerses Lampronensis. In poetry, the literature is very poor. With the 14th century, Armenian literature begins to sink, and only a few important works have since appeared at distant intervals. Yet have the Armeniano, even down to the present day, taken an active interest in their national literature; and in all their settlements the printing-press is to be found in operation. The most interesting of their settlements is that of the Mechitarista, on the island of San Lazaro, near Venice. The Armenian language belongs to the Indo-Germanio stock. The old Armenian, the language of literature, is no longer a living tongue; while the new, or vulgar Armenian, is split up into four dislects, and is much corrupted by Turkish.

ARRENIA, ar-meer'd-a, in Bot., a gen. of plants belonging to the nat. ord. Plumbaginacea. Thrift is the common English name for this genus, which includes many pretty species suitable for growing on rockwork and in pots. The dried flowers of the common thrift,

A sudgaris, are diuretic.

ARMGER, ar'mi-jer (Lat. arma, arms, and gerere, to bear), literally one who bears arms. The expression was formerly applied to the attendant or esquire of a knight. It is a term of dignity now obsolete, entitling the bearer to hold rank above a gentleman, but below knight. (See ESQUIRE.)

ARKILLARY SPREER, ar-mil'-la-re (Lat. armilla, a bracelet), an instrument representing the great circles of the celestial sphere, the equator, ecliptic, tropics, 124

## Arminians

equinoctial colure, &c. It is constructed of rings of metal, representing these circles, fastened together in their relative po-

ARMILLARY SPHERR.

their relative positions, and morsible on a axis passing through the poles: it is furnished with an horizon and meridian similar to those attached to the terrestrial and the celestial globes. It was formerly much used by the cally astroidmers, but is now superseded by the celestial globe. The earth on which the observer stands is supposed to be in the centre of this skeleton sphere.

senting the imaginary circles above named, traced on the apparent sphere of the heavens around him, by which the position of any star may be determined.

(See ASTROLABE.)

Aminians, armin'-i-das, are the followers, or those who entertain the opinions of, Arminius, a Protestant divine, who flourished in Holland about the beginning of the 17th century. He maintained that God had predestinated the salvation or condemnation of individuals only from having foreseen who would not when results of the control of Good market. and who would not accept of offered mercy. His chief opponent was Gomar, who, with the Calvinists, asserted that God had from all eternity, of his free good pleasure, elected some to everlasting life, while he had left others to unbelief and perdition. After his death in 1000 his children with his contract with the contract of the c death, in 1609, his followers rapidly increased, and were vehemently attacked by the Calvinists. In 1610 were vehemently attacked by the Calvinista. In 1610 they addressed a petition to the States of Holland for protection, from which they got the name of Remonstrants. The Calvinists put forth a counter-remonstrance, and, in 1614, the States issued an edict granting full toleration to both parties. This displeased the Calvinists, who continued their persecutions, and at length, in 1619, the doctrines of the Arminians were were driven from their churches, and their clergy were driven from their churches, and forbidden to exercise the ministry in public. In consequence of were given from their courtness, and sormated to exercise the ministry in public. In consequence of this decision, many left the country, and took refuge in France, England, and other places. The views of the Arminians are summed up in the following five articles:—1. That God had, from all eternity, determining the service of the country of the coun mined to save all who, he foresaw, would persevere in the faith, and to condemn all who should continue in the faith, and to condemn all who should continue in unbelief. 2. That Christ died for all men; but that only those who believe are really saved by his death. 3. That man is of himself incapable of true faith, and therefore must be born again, of God, through Christ, by the Holy Spirit. 4. That all good works are to be attributed to the grace of the Holy Spirit, which, however, does not force a man against his own inclination. 5. That God gives to the trule faithful the nation. 5. That God gives to the truly faithful the power to resist sin. With respect to the possibility of a fall from the state of grace, Arminius and his immediate followers were undecided; but his followers came afterwards to believe that it was possible. After 1630, the Arminians were again tolerated in Holland; but, from this time, their opinions underwent a considerable change. They have inclined more and more sucrease change. They have meaned more and more to freedom of thought and the rejection of creeds and confessions. They build chiefly upon the necessity of moral duties and good works, and allow each oue to interpret the Holy Scriptures for himself. They reject many articles of faith, and do away aimost entirely with the necessity of ancour from the Holy Spirit. The Arminians have, however, dwindled away to a very small body; but their tenets, more especially regarding predestination, have been adopted by various other denominations, as the Wesleyan Methodists, as

### Armistice

well as by numerous individual members of other

ARMISTICE, ar'-mis-tis (Fr.), is a truce or suspension of hostilites between two armiss or nations at war, by mutual consent. It sometimes takes place when both parties are exhausted; at other times it is had recourse to with a view to arrange terms of peace. It may be either general or partial; the former between two countries, the latter limited to particular places, as between two armies, or between a besieged fortress and the besiegers. The former in general requires ratification, but the latter is in the power of the commanders of the troops.

ARLET, arm'-let (Lat. armilla), a bracelet or large ornamental ring worn by the ancients upon the wrist or arm. With the Medes and Persians, it was worn by both the male and female sex; but, with the Greeks, it appears to have been adopted by the women only. The wearing of the armilla, or armlet, is of high anti-quity; and we read in 2 Sam. i. 10, that the Amalekite who slew Saul "took the crown that was upon his head, and the bracelet that was upon his arm." Although it was regarded as a mark of effeminacy for a Roman to wear this ornament, it was nevertheless a custom with the Roman generals to bestow armillæ upon soldiers, as a mark of respect for extraordinary deeds of valour. The materials out of which the

ARMLETS.

armillæ were made were as various as the designs into which they were fashioned, a twisted serpent being one of the most favourite forms. The Danes, Norse-men, and Anglo-Saxons also wore the srmlet. William of Malmesbury states that when, in 1940, Earl Godwin made peace with Hardicanute, he ratified it with a splendid present,—a ship the stern of which was inlaid with gold, and on board which were eighty magnificently-equipped soldiers, each wearing an armlet of pure gold weighing 16 ounces. Armlets of gold have been dug out of the bogs of Ireland, and several have been found in England.

ARMORACIA, ar-mo-rail-si-ā, in Bot., a gen. of plants belonging to the nat. ord. Crucifers. The species A. rusticana is cultivated for the sake of the root, which is the common horseradish, so much used as a condiment. The plant is frequently met with, growing wild by the sides of ditches and on the banks of rivers. A volatile oil, resembling oil of mustard, may be obtained from horseradish by distillation, and there can be no doubt that all the valuable properties of the plant depend on this principle. The odour of the oil is extremely powerful, that arising from a single drop being sufficient to fill a whole room. The root is considered to be antiscorbutic, anti-rheumatic, stimulant, diaphoretic, and diuretic, and is frequently used in medicine. Applied to the skin, it produces vessication. A syrup, made with an infusion of the root and sugar, has been used, with success, as a remedy for hoarseness, arising from relaxation. Burnett states that horseradish steeped in milk forms one of the heat averaging states that horseracisn steeped in mink horizon of the best cosmetics. As a dietetic, it is used scraped, or in the form of a sauce, with roasted meat and fish. When caten on an empty stomach, it is deleterious. Some lamentable cases of poisoning have occurred from the substitution of acouste, or monkshood root, for horseradish, which it is supposed to resemble. In the *Pharmaceutical Journal*, Bentley gave the following distinctions between the two roots:

### Armour

irritating; taste, bitter or sweet, according to droumstances, and very pungent. The roots of monisheed and horseradish may also be distinguished by the different appearances they present when scraped with a knife. The former will then be observed to be of a a kine. The former wat then be observed to be or a succulent character, and the acraped portions soon acquire a pinkish, or reddish hue; whilst the latter scrapes firm and dry, and does not after in colour."

scrapes irm and dry, and does not alter in colour. ARNOSIAL BRAENGS, ar-mori-dil, a term applied, collectively, to the shield and its charges, the creat, helmet, and motto, belonging to any gentleman entitled to bear arms. The supporters, belonging, with very few exceptions, solely to peers of the realm, are also included in this expression. It is, however, properly applied to the devices on the shield only. The assessed taxes on armorial bearings for persons chargeable with home-duty or for any agreement. only. The assessed states on armorial bearings for persons chargeable with house-duty, or for any carriage taxed at the rate of £3. 10s. annually, amount to £2. 12s. 4d. per annum, but for persons not so chargeable, 13s. 9d.

Armour, ar'-mor (Lat. armor), the name for all such habiliments as were used to protect the person of the wearer from the weapons of an enemy. From the ear-liest dawn of the historic era, we find mention of this defensive covering. Those ancient nations who were the most civilized, employed leather, brass, iron, and even gold, in the fabrication of their defensive clothing. Goliath of Gath, as is recorded in 1 Sam. zvii. 6, put on greaves to protect his legs, and Homer tells us, that at the siege of Troy the Greciums were "well-greaved." Even at this early period, the greatest skill and care were lavished upon the decoration to Homes the armour of will tarm leader. were layisned upon the decoration of the armour of military leaders. According to Homer, the golden armour of Glaucus was worth a hundred oxen; and, from the description in the Iliad, we may gather how highly ornamented was the shield of Achilles. The Eligin Marhles likewise frequently exhibit a Greek warrior wearing a beautifully-wrought helmet and cuirass. Nor was the war-dress of an ancient Greek less complete, in a defensive sense, than its elaborate ornamentation. In proof of this, we have only to give a minute description of the attire of a heavy-armed a minute description of the attire of a heavy-armed Greek soldier. Having his tunic already upon his body, he put on, 1. his greaves, or leg-guards; 2. his cuirass, or thorax, which, being composed of a back and breast plate, formed a defence for his chest, back, and abdomen; 3. his sword, which was suspended upon his left side by a bolt passing over his right shoulder; 4. his massive round shield; 5. his helmet; 6. he took up his spear. For further information as to these articles, see their respective headings. With the Egyptians, metal armour appears to have been worn only by the metal armour appears to have been worn only by the monarchs and nobility, the soldiery being defended by helmets of quilted linen, their shields being usually of wood. Among the Romans, the lorics, or cuirass, was originally of leather; but subsequently it was made of brass, like the rest of the Roman body-armour. The attire of a Roman soldier was substantially the same as that of the Greek warrior, already described. By Servius Tullius it was decreed that the military equipment of a Roman soldier should consist of six articles, —the ocrea or greave, the lorice or cuirens, the ensis or sword, the clipeus or shield, the cassis or helmet, and the hasta or spear (see these words). All these portions, except the spear, are alluded to in a celebrated passage of St. Paul (Eph. vi. 17). With respect to the armour worn in England, it is supposed that the early Britons had acarcely any other defensive armour than a shield. The Anglo-Saxons, however, possessed a more complete equipment. From old illuminated manuscripts, one of the laws of Athelstan, and other data, we learn, that at various periods they ment of a Roman soldier should consist of six articles, illuminated manuscripts, one of the laws of Athelatan, and other data, we learn, that at various periods they wore the shield, helmet, neck-guard, and breastplate, the whole of which is believed to have been made of leather or rough bides. They are also stated by Alcuin to have worn a well-fitting linen tunic, which "Aconite—root conical in form, and tapering perceptibly to a point: confiee-coloured, or more or less brownish externally; odour merely earthy; tasts at first bitter, but afterwards producing a disagreeable tringling and numbuses. \*\*Horseralisk\*-root slightly conical at the crown, then cylindrical, or nearly so, and almost of the same thickness for many inches; Norsemen, a tunio with long sleeves, and a hood and white, or with a yellow tinge; odour especially de-white, or with a yellow tinge; of white, or with a yellow tinge; of white, or with a yellow tinge; of when the Danes first arrived in Britain, their defensive covering appears the point of have consisted of a broad leather collar, encircing their neck and chest, and shin-pieces; but during the ohied of a broad leather collar, encircling their neck and chest, and shin-pieces; but during the ohied of a broad leather collar, encircling their neck and chest, and shin-pieces; but during the ohied of a broad leather collar, encircling their neck and chest, and shin-pieces; but during the ohied of a broad leather collar, encircling the intervence of the point of the way and the work of performed in Britani, their defensive covering appears to have consisted of a broad leather collar, encircling the reck and chest, and shin-pieces; but during the point of the same thickness for many inches; and the production of the same thread the point of the shield, or well-defensive covering appears and the point of the shield, or well-defensive covering appears and the poi

#### Armourer

or mascles. On their head they also were a conical skull-cap, probably of leather, from which pieces could be let down, and thereby afford a perfect protection for the whole of the face. This helmet was surmounted by an apex or circular knot, from which, as a centre, a painted circle of star-rays radiated. For offensive arms, they had battle-axes, swords, and spears. In the Norman period, an entire suit of armour, frequently termed harness, consisted of a casque or belmet, a gorgot, cuirass, gauntlets, tasses, brassets, cuisses, and leg-coverings (see these words). This was the usual wear of feudal lords, knights, and cavaliers, whether in battle or in the tournament, and was called armour cap-a-pic. It underwent various changes during the reigns of Bufus, John, Henry III, and Edward III. Until the time of the last-mentioned monarch, armour was generally of chain-mail; but, in the 14th century, plate-armony came into use, and, becoming more and more elaborate and richly-ornamented, reached its climax of splendour during the reign of Richard III., when it was often beautifully damascened and inlaid with gold. Fluted and engraved armour was much in fashion in the days of Henry VII and VIII.; but, in the reign of James I., the general use of armour fell into disrepute, and the steel coverings for the lower limbs were almost wholly laid aside. Charles I. endeavoured to revive the fashion of wearing a complete suit of armour; and we may learn how much attached he was to iron habiliments, from his being so often represented in them in paintings. The only armour worn in the days of the Protectorate was only armour worn in the days of the Protectorate was the helmet and cuirass, both of which are, by the way, still retained in several élite corps of the European armies, such, for instance, as the English life and horse-guards, the cent-gardes of France, the imperial guard of the czar of Russia, &c. These remnants of an iron-clad age may, however, be said to be less awardeally thus though an interesting recar serviceable than showy. An interesting paper, com-municated to the Society of Antiquaries by Sir Samuel Meyrick, explains the mode in which a knight attired himself in his suit of steel. He commenced with his tynes, or steel clogs; 2. his greaves, or shin-pieces; 3. his thigh-pieces, or cuisses; 4. his breech of mail; 5. his tuillettes, or overlapping pieces below the waist; 6. his cuirass, or breast plate; 7. his vambraces, or coverings for the arms; 8. his rerebraces, or coverings for the remaining portions of his arm to the shoulder; 9. his gauntlets; 10. he hung his dugger; 11. he put on his short sword; 12. he donned his cloak; 13. his on his short sword; 12. he donned his cloak; 13. his bacinet; 14. his long sword; 15. he took into his left hand his pennoncel; 16. he took up his shield.—When thus "locked up in steel," the knight was said to be armed cap-à-pie, an old French phruse for 'head to foot; in other words, he was armed at all points, either for offence or defence.—Hef. Meyrick's Critical Inquiry into Ancient Armor; Gough's Sepulchral Monuments; Hewitt's Ancient Arms and Armour; English Cyclopadia—Arts and Sciences.

Armoures, armorer, in the British army, is a

ARMOURE, ar-mor-er, in the British army, is a soldier whose duty it is to keep in repair the barrel, stock, lock, and other parts of the rifles, pistols, or carbines of the troop of cavalry or company of infantry to which he belongs. His remuneration for these services is regulated by a tariff of prices, and he is also paid by the captain of his troop or company a asso paid by the captain of his croop or company a penny a month for each soldier's rifle or carbine, the lock of which he is required to take to pieces and clean. In the British navy, the armourer is a warrant officer, assisted by a subordinate who is called armourer's mate. On ship-board the armourer has under his care

mate. On ship-board the armourer has under his care all the pistols, rifles, cutlasses, boarding-pikes, &c.

Arms, arms (Lat. arma), or weapons of offence, may be divided into two principal classes,—those that act by explosion, and those that do not. To speak first of the earliest of these arms, those wielded without the assistance of gunpowder, the simplest and most natural perhaps of all arms is the club; but the earliest affective weapons, properly so called werethe how and the earliest of these arms, those wielded without the assistance of gunpowder, the simplest and most natural perhaps of all arms is the club; but the earliest offensive weapons, properly so called, were the bow and arrises, and we read in Holy Scripture of Isaac telling Esau to take his bow and quiver, and go forth into the field and take venison (about a.c. 1760). Employed altitude take venison (about a.c. 1760). Employed with China, in 1860, with remarkable effect, invented altitude to the being required as a weapon of war.

## Armstrong Gun

The sling was, in all probability, its successor in mili-tary operations. Lucretius, tracing the progress of offensive arms, says :-

"Arma antiqua, manus, ungues, dentesque facre, Et lapides, et item sylvarum fragmina rami, Et flamme, atque ignes postquam sunt cognita primum ;. Posterius ferri vis est, grisque reperta;

Et prior æris crat quam ferri cognitus usus."

"Man's earliest arms were fingers, teeth, and nails, And stones, and fragments from the branching woods Then fire and flame they joined, detected soon, Then copper next; and last, as latest, traced The tyrant iron, than the copper vein Less freely found, and sturdier to subduq.")

After the bow and arrow, the pike, lance, spear, dart, javelin, dagger, mace, axe, chariot scythe, dirk, bayonet, sword, &c., came to be employed. The balista, catapults, and battering-ram, may be said to be the precursors of the modern artillery. The invention of gunpowder led to the introduction of an immense vaof gunpowder led to the introduction of an immense variety of weapons of offence, acting by the agency of this destructive compound. As most of these arms will be severally described at length under their own headings, it will not be necessary to furnish more than a brief enumeration of them in the present article. The hand-cannon, probably the earliest in date, was a simple tube fixed on a straight stock of wood, and furnished with a touch-hole and trunnions, like the large cannon of the present time. The hand-gun was cast in brass, and was used in England as far back as the year 1446, and rendered important service at the siere of brass, and was used in England as far back as the year 1446, and rendered important service at the siege of Constantinople in 1453. The arquebus, or harquebus, is mentioned as early as 1476. The harquebut, hakebut, or hagbut, differed from the arquebus in having a bent stock, an improvement which enabled it to be brought nearer to the level of the eye. The deraihaque was a long pistol with a butt curved almost into a semicircle. The musquet was invented by the Spaniards, and was first used at the battle of Pavis. The Italians invented the rose-lock, or wheel-lock, and introduced it into warfare about the time of Henry introduced it into warfare about the time of Henry VIII., as an improvement upon the matchlock. The snaphaunce superseded the wheel-lock, but was commonly used in the reign of Elizabeth, and was in turn supplanted by the caliver, carabine, esclopetta, and fusil. This latter,—from which the term fusilers, applied to certain of our English miantry regiments, was derived, was invented by the Freuch in 1630. During the certain of our linguist inlantly regiments, was invested by the French in 1630. During the reign of Charles II, the blunderbuss, so called from the Dutelf donderbus (thundering gun), seems to have been imported from Holland. Somewhat resembling this latter weapon was the dragon, so called from having the muzzle ornamented with a dragon's head. The conjecture is, that the modern term dragoons was derived from this weapon. The musket, a better form of firelock, continued to be used until quite a recent date in military operations; but, at the present time, date in military operations; but, at the present time, the rifle, the most complete portable weapon of offence acting by explosion, has become general throughout the armies of England, France, &c. The rifle is not, however, a newly-invented weapon, although it has lately been so wonderfully improved. (See RIFLE, BAYONET, &c.) For an account of non-portable explosions are accounted to the right of the righ sive weapons, see ABTILLERY.)-Ref. Gross's Military History; Sir S. Meyrick's Memoir on the Introduction of Fire-arms.

ARMS, BELLS OF, in Mil., a conical-shaped tent, which is pitched in the field, to contain the whole of the arms of a company of infantry. They are also called bell-tents," and are usually painted with the colours of the regiment and with the royal arms.

and qualities of the Armstrong gur, which render it poculiarly valuable in modern warfare:—1. Its light-ness in comparison with every description of cannon in general use, which it is rapidly superseding; the weight of an Armstrong 32-pounder and one of the ordinary kind being about 28 cwt, and 57 cwt, rethe ordinary kind being about 26 cwt. and 87 cwt. respectively. 2. The economy effected in the consumption of powder, half the quantity used to charge an ordinary cannon being sufficient for an Armstrong gun of the same calibre. 3. The great length of range attained, shot and shell having been thrown by this arm to a distance of more than five miles. 4. Its non-liability to injury arising from repeated firing, from the peculiar method used in making the gun. 5. The great accuracy of aim to be attained, objects of strail size being histographic fire and the control of th being histories times out of ten, at a distance of 4,000 or 5,000 yards, at which they are but just perceptible to the naked eye, the apparent size, at that distance, of an object ten feet square, being less than a postage stamp. 0. The adaptation of the convenient method of loading at the breech of the gun. And lastly, the peculiar construction of the clongated shells formed peculiar construction of the clongated shells formed of separate pieces, lifty in number, fitted together in an external covering of iron, and provided with fuses that can be regulated with such exactness, that the missile can be fired through a thick mass of solid tim-ber without injury to itself, or that explosion can be insured with the slightest degree of concussion, or at any point of its path between the muzzle of the gun and the object at which it is directed. To insure and the object at which it is directed. To insure strength, coupled with lightness and durability, the gun is made of pieces of the very best wrought iron, which are put together in a manner similar to that used in making gun-barrels out of nails, horseshoes, and pieces of iron rods, which are twisted round a steel bar, and hammered together. The bars used for the Armstrong guns are flat, and about two inches wide. They are brought to a white heat, twisted round a steel core, and then welded together; more bars are then twisted over these in a contrary direction, and then twisted over these in a contrary direction, and the process is repeated until the required degree of thickness is attained. The hollow cylinders of welded iron thus formed are about three feet long, and, from iron thus formed are about three feet long, and, from these pieces, guns of any desired length can be made, by fitting the ends carefully together, and joining them with rings of wrought iron. The bore of the gun is riled by machinery, with a large number of small grooves close together. These grooves form a complete twist round the bore in a distance of ten feet, and there are as many as forty in a gun of 2½ inches bore. It differs in this respect from an ordinary rifled gun, which has only two, three, or four grooves, and from the Lancaster and Whitworth guns, the former of which has an oval, and the latter a polygonal bore. which has an ovel, and the latter a polygonal bore. The shot and shell used for the Armstrong guns are clongated, the length being about three times the diameter. Bands of thin lead are attached to them, that they may take the form of the rifled interior of the bore when forced forward by the explosion of the charge, and acquire a rotatory motion as soon as they have left the muzzle. In order to load the gun at the breech, an aperture is cut into the bore at the breech end from the upper side, rather wider than the bore end from the upper side, rather wider than the bore itself, and long enough to admit the shot or shell, with the charge of powder, which is pushed forward into the bore by the hand. After loading the gun, this aperture is closed by a movable breech-piece, faced with a disk of copper, at the end next the charge. This disk is forced into the bore immediately behind the charge, by a screw which passes through the breech end of the gun, and presses forward the breech-piece when turned by the hand-lever attached to it: the copper expands at the moment of explosion, and prevents all escape of gas. The end of the breech-piece mearest the charge, as well as the copper disk, is bored vents at escape of gas. The end of the breech-piece nearest the charge, as well as the copper disk, is bored to receive a small discharging cartridge; and the touch-hole for the detonating plug which fires this eartridge is formed in the upper side of the breechcarriage is formed in the upper side of the breechpiece, and passes into the bore which contains it; so
that when the gun is to be discharged, the detonating
plug is struck, and the small discharging cartridge
thereby fired, which communicates its fire to the
charge. Many of our men-of-war and fortresses are
furnished with Armstrong guns of very large calibre,
time capable of discharging shot 100 lbs. in weight.

The lightness of the 9- and 12-pounders renders them well suited for field batteries and horse artillers. ARMY, orm'-e, is a term formed from the French word AREY, ormi-q, is a term formed from the French word armée, and denotes a body of men trained and disciplined for military service, under the command of a chief or leader, with a regular gradation of subordinate officers. This term is usually applied to the regular or standing army of a nation; sometimes, however, it is employed to include also the militia and volunteers. A number of regiments sent out on a particular expedition under the assumed of one person is also called dition under the command of one person is also called an army. The person in command is termed the general or commander-in-chief; when two or more allied armies are under the chief direction of one officer, he is usually styled generalissimo. A general has under him lieutenant-generals, major-generals, colonels, lieutenant-colonels, majors, captans, and subalterns. An army is composed of a certain number of corps, each consisting of brigades, regiments, battalions, and squadrons. Though people must have gone to war with each other at a very early period of the world's history, and must have soon recognized the importance of a certain amount of skill in carrying on their operations, yet it must have been come time later before they could be said to have had armies. The possession of a body of men trained and disciplined for attack or defence, denotes a comparatively high state dition under the command of one person is also called attack or defence, denotes a comparatively high state of civilization. The earliest trained army of which we attack or defence, denotes a comparatively num whose of civilization. The earliest trained army of which we have any account was that of Sésostris, king of Egypt, who flourished about sixteen hundred years before Christ. It was organized for the purpose of conquering the world, and consisted, according to Diodorns Siculus, of 600,000 infantry, 24,000 cavairy, and 27,000 war-chariots. In the reign of David, who increased the standing army which Saul had introduced, the Jews acquired considerable skill in the military art. Solomon introduced cavairy into the army, and also chariots. Subsequently, the Persians came to be distinguished for their military solievements. The strength of Subsequently, the Persians came to be distinguished for their military sohievements. The strength of their army, however, consisted in its cavalry, who were noted for their bravery, and impetuosity in attack. Their infantry seems to have been little better than an armed mob, and hence the repeated defeats that they sustained from comparatively small defeats that they sustained from comparatively small bodies of Greeks, The army with which Kerxes invaded Greece is said, including the sea forces, to have amounted to upwards of two millions and a half of fighting men. According to Arrian, Darrias brought into the field against Alexander 1,000,000 infantry, 40,000 cavalry, 200 chariots armed with scythes, and 15 clephants. Allowing for the exaggerations in these numbers, they still may be taken as evidence that the Porssian army was very great. In Greece split may numbers, they still may be taken as evidence that the Persian army was very great. In Greece, split up as it was into a number of petty states, a warlike spirit was early engendered. Hence we find that one great object of their rulers was to organize a physical training and an education specially fitting them for war. To the institutions of Lycurgus the Spartans were indebted for the military pre-eminence which they held among the states of Greece. They were taught to accustom the body to hardships and the mind to suffering, to despise luxury and refinement, and to practise abstinence and self-denial. Indeed, the entire training of a Spartan was with a view to making him a good of a Spartan was with a view to making him a good soldier; so that for skill and a high state of discipline, sonder; so that for skin and a high state of discipline, the Spartans were unrivalled among the Greeks. They paid great attention to arrangement, and were the first to introduce the phalanx, a particular mode of arranging the infantry. The Spartan phalanx was eight files in depth, the files in open or marching order being six feet apart; in close order, three feet; and in locked rect apart; in close order, three feet; and in location order, for receiving an attack, a foot and a half. The military system of the Athenians agreed in its leading features with that of the Spartans, but was carried out with less exactness. The Spartan was steady, devoted, and firm; the Athenian bold, enterprising, and dexterous. They had three classes of troops,—the heavyand arm; the Athenias bold, enterprising, and exterous. They had three classes of troops,—the heavy-armed infantry, who fought in phalant, armed with spears, swords, corsistes, and shields; the light-armed infantry, armed with light spears and shields; and a kind of irregular infantry, for harassing an enemy on the march, being armed with javelins, bows and arrows, and sings, but with no defensive armour. As regards the military strength of the Athenians, we see told that they had 10,000 heavy-armed troops at Marathon,

Army and 8,000 heavy-armed, and as many light-armed, at Plates. Philip of Macedon made several improvements in the arms and arrangement of his soldiers. He made the phalanz deeper and closer than it had been among the Spartens, and introduced spears 24 feet in length; so that in the phalanx the spears of the fifth rank projected three feet beyond the first rank. He also organized bodies of cavalry, first rank. He also organized bodies of cavalry, and was the first to maintain a standing atmy in Greece. The Macedonian army was further improved by his son Alexander, in the train of whose army we, for the first time in Greek history, find artillery in the shape of ballitic and catapultic. The strength of the Macedonian army in the time of Philip probably did not exceed 30,000 fighting men. During the reign of Alexander, however, it was much increased; and, at the battle of Arbela, the Macedonian army consisted of 32,000 havers armed infants. 16,000 light armed of 32,000 heavy-armed infantry, 16,000 light-armed infantry, and 4,000 cavalry, besides several thousand suxiliaries; making in all probably about 60,000 fighting men. The army of the Carthaginians differed from the Greek armies in that it was composed chiefly of mercenary troops, or at least levies from different countries; and yet these troops defeated the Romans in several pitched battles. Livy tells us that Hannibal in several pitched battles. Lavy tells us that Hainnoal set out on his expedition against Haly at the head of 100,000 foot and 10,000 horse; but that he lost 30,000 med in crossing the Alps. This seems to be an overstatement; for, according to Livy himself, Hannibal at Trebia had only 30,000 infantry and 10,000 cavalry, and at Canama 40,000 foot and 10,000 horse. Seeing, however, that Hannibal left two armies in Spain, the however, that Hannibal left two armies in Spain, the Carthaginian forces may be moderately estimated at, at least, 100,000 men. The Roman army in its best days surpassed in organization and discipline that of any nation that preceded it. The military age was from 17 to 48 or 50; and, in pressing emergencies, every citizen between these ages was obliged to serve as a soldier; but usually the more youthful of the population were preferred. Their training was of the severest description, not being confined to mere military matters but directed also to the descloyment of severess accertpion, not being commen to mere min-tary matters, but directed also to the development of their physical and mental powers, inuring them to labour, fatigue, and hardships, and inspiring them with boldness and self-reliance. The basis of the Roman army was the legion, which comprised both infantry and cavalry, and at first consisted of about 3,000 men; but afterwa rds the number was increased, till, in the later period of its history, it amounted to from 5,000 to 6,000 men. The legions were formed annually, the magistrates choosing from the different tribes of citizens those whom they considered best fitted for military service. A legion was commonly composed of from 1,200 to 1,500 or 1,600 hastati, who were young men in the flower of youth, and who were placed in the first line in battle; a like number of principes, or men of middle age, who formed the second line; and about mindle age, who formed the second line; and about 600 triaris, or veterans, who constituted the third line. Besides these, each legion had 300 cavalry and about 1,200 velites, or light infantry, who were the youngest men in the legion, and were armed with hows, slings, and javelins for harassing the enemy. When drawn up in order of battle, the hastati formed 10 ccrps, each corps having 16 men in front and 10 deep; the principes, or second line, were drawn up in the same manner; the triarii were also divided into 10 corps, but had only 10 men in front and 6 in depth. The velites had no particular station. Afterwards the legion came to be slivided into cohorts, without regard to the lines. There were 10 cohorts in a legion, 3 manipules in a school and 2 contains in a There were 10 cohorts in a legion, 3 manipules in a cohort, and 2 centuries in a manipule. Accordingly, in a legion of 6,000 men, a century consisted of 100; and hence its name. The cavalry were divided into 10 furms, or troops, and each furms into 3 decuries, or bodies of 10 men. The distinguishing characteristic of the legion was its astonishing mobility, by which it was emplied to adapt itself to every change and every variety of gircumstence. It was admirable suited either was empired to anapt useful to every change and every variety of circumstance. It was admirably suited either for attack or retreat. The arms of the heavy-armed infantry were a sword, the pilum, or heavy dart, and the pike. The pilum was originally a weapon only of the veterans, but afterwards was used also by the hostatis and principes. The pike was used only by the veterans. Their defensive armour consisted of a large

Army

made of wood and covered with a bull's hide; a helmet or head-piece of brass for covering the head, and formed so as to protect likewise the neck and shoulformed so as to protect likewise the neck and about ders; a outrass, or breastplate, made of brass, and about a foot square; and the ocrea, a boot or greave fortified with iron, and worn for the protection of the right leg. The light infantry had swords and javelins, and were also fushished with bows and slings. The cavalry had nearly the same armour as the heavy-armed infantry. The total number of Roman legions under Augustus was 25, under Alexander Severus 32; but, during the civil wars, the number was much greater. In the latter days of the empire, the luxury, corruption, and love of ease which characterized the Roman people, soon manifested itself in the army. people, soon manifested itself in the army. Their manners were corrupted and discipline was relaxed, till at length their aplendid army degenerated into a feeble militis, unable to withstand the attacks of the barbarians of the North, by whom the empire was at length overthrown. After the subversion of the Roman power, the feudal system which was introduced was hostile to great military achievements, or the establishment of large armies. Military service was the tenure ment of large armies. Military service was the tenure by which occupiers held their lands; and, while the by which occupiers held their isnut; and, while the barons enjoyed unlimited authority over their vassals, and were frequently at war with their neighbours, there were no great armies. In the lith century the Crusades roused the minds of men, and called forth the whole energy of Europe. Mighty armies were marched into Asia to deliver the Holy Land from the dominion of the internal control of the control of t of the infidels. Many sanguinary battles were fought; but the combatants on both sides were little better than tumultuous masses impelled by fanaticism to deeds of valour. Charles VII. of France was the first to introduce standing armies in Europe, after the fall of the Roman empire. After his war with England of the Roman empire. After his war with England (1445), under pretence of keeping always in readiness a force sufficient to defend the kingdom against sudden invasion, when he disbanded his other troops, he retained under arms a body of 16,000 infantry and 9,000 cavalry. He appropriated funds for their support, and appointed officers to command and discipline them. This occasioned an important change in the affairs and nolicy of Europe. By depriving in the affairs and policy of Europe. By depriving the nobles of that direction of the military force of the state which had raised them to such power and importance, a deep wound was given to the feudal aristocracy; while the establishment of a national force always at the command of the sovereign was a new and powerful engine for repressing their turbu-lence and strengthening the authority of the crown. The kings of France were enabled to carry on operathe kings of rance were enabled to carry on opera-tions with greater vigour and to a greater extent than formerly; and the expedition of Charles VIII, into Italy confirmed the superiority and reputation of a standing army. This led to an entire change in the military system of Europe. Those who had to contend with France had to adopt similar establishments, till at length standing armies became general all over Europe. Before this time the introduction of firearms had in a great measure changed the organization and equipment of the army. Personal courage, strength, and dexterity lost their exclusive importance, and the The advantages of regular tactics began to be felt, and war came to be more and more reduced to a system. It is usual to divide the history of armies in modern times, or since the invention of gunpowder, into seven periods. The first period begins with the employment of cannon, and extends to the campaign of Charles VIII. in Italy. The second period extends from the latter event to the commencement of the wars in the Netherlands, or from the end of the 15th to the middle of the 16th centuries. It comprises the wars of the French, Germans, and Spaniards in Italy. The third period comprehends the great war of independence carried on by the Netherlands in order to throw of the yoke of Spain, and extends from 1568 to the general suspension of hostilities in 1609. This war led to great improvements in the organization and tactics of armies. Improvements in the organization and tectures armies. By skill and discipline, a people, mostly merchants and manufacturers, howed down by oppression, were able to cope with and at length ignominiously expel from their country, the forces of the first power in Europe. The fourth period comprises the Thirty Years' war in

buckler or shield, 4 feet in length by 24 in breadth,

Army

Army

Germany, and extends from 1881 to 1648. In this war Gustavus Adolphus greatly changed the character and tactics of armies. He departed from the dense forma-tion of his predecessors, introduced lighter weapons, and made many improvements in the artillery, by which quicker and more complicated movements be which quicker and more complicated movements became practicable. The fifth period comprehends the wars of the French in Italy, in Germany, and in the Netherlands, as well as the Northern and Turkish wars, and embraces a period of ninety years, namely from 1648 to 1738. In the wars of Louis XIV., during this period, great improvements were introduced in the art of carrying on military operations, under such generals as Turenne, Luxembourg, and Condé, while opposed to them were Marlborough, Eugene of Savoy, and other aminent generals. Standing armies now and other emineat generals. Standing armies now attained an extent hitherto unexampled. Instead of the 14,00 men maintained by Henry IV., Louis XIV., after the peace of Nimeguen, had an army of 138,000 men. To this period, too, belong the wars of Charles XII., under whom the Swedish infantry attained a high degree of perfection. The sixth period includes the three Silesian wars, and extends from 1740 to the breaking out of the French Revolution in 1792. The Prussians had been for some time increasing their standing army and improving their military discipline, so that when Frederick the Great ascended the throne, in 1740, he found himself at the head of an army of about 80,000 men, in a high state of efficiency. This army he greatly increased and improved during his successive wars, till Prussian tactics became a pattern for all the other states of Europe. The seventh and last period extends from the period of the French Revolution to the present time. The standing armies and the military science of this period far outnumber and surpass those of any one preceding.—We shall conclude this article with a short account of the armies of the principal states, beginning with our own. The British army, according to the Army Estimates for 1869-70, consisted of 191,073 men of all ranks, of whom 63,707 are on the Indian Establishment. They are thus divided :-

Regiments.	Men.	Total.
Royal Horse Artillery	1,768	
Riding Establishment, Royal }	225	
Life and Horse Guards	1.308	
Cavalry of the Line	9,048	
Royal Artillery	15.384

General and Departmental Staff		875
Establishments		434
Miscellaneous Establishments		529
Total British forces		127,366

The cavalry of the British army consists of the Royal Horse Artillery, two regiments of Life Guards, the regiment of Royal Horse Guards, seven regiments of dragoon guards, and twenty-one regiments of dragoons, both light and heavy. The infantry includes the regiment of Royal Artillery, comprising twenty-seven brigades, the Royal Engineers, the Military Train, Grenadier, Coldstream, and Scots Fusilier Guards, one hundred and nine regiments of foot, the Rifle Brigade, the Army Hospital Corps, Commissariat Staff Corps, three West-India regiments, and several colonial corps.—In the French army the duration of service in the active army is five years; at the end of this term the soldier enters the reserve for four years longer. The young men who have not been comprised in the active army have to serve four years in the

reserve and five years in the National Garde Mobile. The army is recruited by conscription; but the young men drawn for the active army are allowed to provide men drawn for the active army are allowed to provide substitutes. This privilege is not allowed to the men of the reserve. The government greatly encourages the re-enlistment of old soldiers. The price to be paid for substitutes is regulated by the government; in the year 1868, the Minister of War settled the price to be paid at £100. This sum goes to the army-fund, from which substitutes are paid a certain sum on joining the army, an increase of pay at the end of seven years, another at the end of fourteen, and a pension of a franc por day after forty-flve years, service. A years, snother at the end of fourteen, and a pension of a franc per day after forty-live years's service. A soldier is permitted to re-enlist so logs as he is fit for service. On the peace footing the organization of the French army is as follows:—Infantry: three regiments of imperial grenadier guards, 6,600; four regiments of imperial voltigenrs, 8,800; a hundred regiments of infantry of the line, 198,871; seven regiments of bassaurs 18,103, four regiments of Fourage. ments of chasseurs, 16,103; four regiments of Zonaves, 9,746; one regiment of African light infantry, 1,659; one regiment of foreign legion, 2,577; three regiments one regiment of roreign legion, 2,377; three regiments of triallieurs of Algeria, 6,000; one regiment of veterans and other troops, 2,296;—total, one hundred and twenty-four regiments of infantry, consisting of 252,652 men. Cavalry: one squadron of Cent-Gardes, 221; two regiments of carabiniers, 1,764; twelve regiments of currassiers, 10,915; thirteen regiments of drugoons, 11,631; nine regiments of lancers, 8,103; of dragons, 1,051; line regiments of mounted chasseurs, 11,676; one regiment of imperial guides, 1,047; eight regiments of lussars, 7,546; three regiments of chasseurs d'Afrique, 3,381; three regiments of spahis, 3,489; two regiments of remonté and cavalry school, 2,285; total, sixty-six regiments and one squadron of eavalry, with 62,793 men and 48,143 horses. Artillery: six with 62,799 men and 43,143 horses. Artillery; six regiments of foot artillery and sixteen regiments of horse artillery, comprising 32,850 men; two regiments of artificers, 1,639; three regiments of train artillery, 3,709; two regiments of armourers and gummakers, 1,634;—total, twenty-nine regiments of artillery, 16,636 horses, 39,852 men, and 1,362 guns. The regular army is completed by several regiments of expiners by the candarmeria and the trops of the engineers, by the gendarmerie and the troops of the administration. The latter consist of 1,174 staff administration. The latter consist of 1,174 stationficers, 819 chaplains, surgeons, and apothecaries; 370 veterinary surgeons; 5 companies of mechanics and engineers; 2,575 officers and privates of the Invalides; 2,490 officers and pupils of the military schools; 2,894 men of the Garde de Paris; 1,299 schools; 2,50s men of the Garde de Faris; 1,205 pompiers, and various other troops, amounting altogether to 15,066 men, with 5,442 horses on the peace footing, and 33,365 men and 12,000 horses on the war footing. We borrow from Martin's Statesman's Year-Book for 1870 the following tabulated statement:—

## Summary of the French Army.

อแนกเฉา	y of the	rrenon 2	ur my.	
	PEACE F	COTING.	WAR FO	OUTING.
	Men.	Horses.	Men.	Eorses.
Staff	1,773	160	1,841	200
Infantry	252,652	324	515,937	450
Cavalry		48,143	100,221	65,000
Artillery	39.882	16,646	66,132	49,838
Eugineers	7,486	884	15,443	1,400
Gendarmes	24,535	14,769	25,688	15,000
Troops of the Ad- ? ministration }	15,066	5,442	33,365	12,000
Total	404,192	86,369	758,727	143,233

In the French army the staff is thus organized:—Nine field-marshals; 170 generals of division, of whom 40 are in the reserve; 340 generals of brigade, of whom 180 are in the reserve; there are 1,251 staff-majors, of whom 352 are in the reserve; finally, there are 75 military interpreters. All general officers must retiro from active service at the age of sixty-six; but there is an exception to this regulation in favour of generals who have commanded in face of an enemy.—The Prussian army:—The military organization of the kingdom, dating from the year 1812, is based on the principle, that every man capable of bearing arms shall receive military instruction and enter the army for a certain number of years. There are practically

some exemptions from military service, though no substitution whatever is allowed. Every Prussian subject is curolled as a soldier as soon as he has completed his twentieth year. He has to be in service during seven years, of which three years—from 20 to 23—must be spent in the regular army, and the remaining four years—from 23 to 27—in the army of reserve. At the end of this term the soldier enters the 'landwehr,' or militia, for nine years, with liability to be called upon for actual practice, and to be incorporated in the regular army in time of war. Leaving the 'landwehr' the soldier is finally enrolled, till the age of 50, in the 'landsturm,' which body is only called upon for service within the frontier of the country in ease of invasion. There are various exemptions from this law of military service in favour of the nobility, clergy, and some other classes of the population. A certain amount of education and fortune constitutes also a partial exemption, inasmuch as young men of twenty who can pay for their own equipment and pass a light examination, have to serve only one year in the regular army, instead of three. But in this case the liability to service in the army of reserve—the landwehr and the landsturm—remains the same." Official returns made up at the close of last year gave the strength of the Prussian army as follows:—

Officers.	Rank & File	. Horses.
6,697	188,948	3,255
352		112
431		3
1,898	52,786	55,810
1,672	31,854	10,037
234	6,489	91
156	2,925	1,599
1,484	4,715	2,400
12,924	299,704	73,307
	6,697 352 431 1,898 1,672 234 156 1,484	352 8,480 431 3,512 1,998 52,786 1,672 31,854 234 6,489 156 2,925 1,484 4,715

The above tabulated statement shows the constitution of the Prussian army on a peace footing. On a war footing the numbers can be raised to 700,000 men. The mobilization of the reserve troops may be completed in about a fortnight's time.—The Russian army, according to the latest returns, is thus constituted:—

	On Peace	On War
1. REGULAR ARMY.	Footing.	Footing.
Infantry	364,422	694,511
Cavalry	38,306	49,183
Artillery	41,731	48,773

3. ARMY OF 2ND RESERVE.		
Troops of all arms	254,036	199,380
General Total	892,648	1,135,973

In addition to the regular army there are the Cossacks, of whom there are in military service in various parts of the empire, in round numbers, 129,000 fighting men. We footing. — The army of Beigium is recruited by Robles, magistrates, clergymen, and students are exempted from serving in the Russian army; merchants and traders are likewise exempted. The regular army is recruited, chiefly by conscription, from the various of this army is,—Infantry, the artisan and peasant classes, every individual member of which is liable, with but few exceptions.—

The Austrian standing army is formed by conscription, to which every male who has reached his twentieth year is fished. The war footing of this army is,—Infantry, 74,000; cavalry, 7,903, and 6,572 horses; artillery, is well as about 25,000 minus.—

Every man who has reached his twentieth year is scribed at 40,000 men. In addition to the army there is the Garde Nationale composed of citizens between which are spent in active service, and the remaining 20 and 40 able to bear arms. The Garde Nationale

seven in the reserve. In addition to the standing army there is the landwehr, the term of service in which is twelve years. In the Tyrol and on the military frontier there is the landstum, or general levy of able-bodied men. The standing army of Austria is thus constituted:—Infantry: Eighty regiments of the line, 121,940 on a peace footing, 485,540 on a war footing; fourteen military-frontier regiments, 12,307 on a peace fobting, 53,923 on a war footing; one regiment of Tyrolese jäger and thirty-three battalions of field jäger, 20,251 on a peace footing, 54,463 on a war footing; twelve companies of ambulance and hospital service, 1,150 on a peace footing, 3,376 on a war footing;—total of infantry, 155,578 on a peace hospital service, 1,180 on a peace footing, 3,786 on a peace footing;—total of infantry, 155,578 on a peace footing; on a war footing 597,602. Cavalry: Fourteen regiments of dragoons, fourteen regiments of hussars, and two regiments of lancers, on a reace footing 35,793; on a war footing 58,794. Artillery: Twelve regiments of field artillery, 17,480 on a peace footing, on a war footing 43,836; twelve battalions of footrages and two hytellogy of recentain settliery. footing, on a war footing as,830; twelve nattained of fortrees, and two battalions of monatain artillery, on a peace footing 7,778; on a war footing 18,938;—total of artillery on a peace footing 25,658; on a war footing 62,774. The total of engineers and train on a peace footing is 9,868, on a war footing 45,134. Of miscellaneous establishments, consisting of the commissarint, survey, sanitary, topographical, and other departments, there are 23,858 on a peace footing; on a war footing 33,762. Total of Austrian standing army, inclusive of troops of reserve, 278,470 on a peace footing, 838,700 on a war footing. — The army of the kingdom of Italy is formed by conscription, the term of service being ten years. Should there be an interval of peace in these years, the men are allowed to go on furlough during half the period. Every male subject is liable to the conscription. According to the latest return, this army was thus consti-tuted:— Infantry of the line, 118,85°) on a peace footing, 303,122 on a war footing; bersaglieri, 14,727 trative troops, 4,463 on a peace footing, 8,215 on a war footing; military instruction, 2,964 on a peace footing, and the same number on a war footing;—total, 199,557 on a peace footing, 445,5(4) on a war footing.—The entire strength of the military forces of the North German Confederation amounts to 319,358 men on the peace footing, and to 977,262 men on the war footing.

The forces of Denmark comprise twenty battalions of infantry of the line, five regiments of cavalry, and trades bettering of writings. The total stages have twelve batteries of artillery. The total strength of the army, exclusive of the reserve, is 30,782 men and 1,068 officers on the peace footing, and 47,925 men, with 1,328 officers, on the war footing. In addition, there is a reserve. In the Swedish army there are ive distinct classes of troops: they are-1. The indelta, or national militia, maintained not by the government, but by the landowners, assisted by a cer-tain proportion of the income of the state domains. 2. The conscription troops, which are drawn by annual levy from the male population between the ages of 20 and 25 years. The privilege to purchase substitutes is allowed. 3. The enlisted troops. 4. The volunteers. 5. The militia of Gothland. With the exception of the volunteers, amounting to 40,000 men, there are in the volunteers, amounting to 40,000 men, there are in the army of Sweden 85,000 infantry of the line, 6,000 cavalry, 5,000 artillery, as well as about 48,000 militia.

—Norway possesses a separate army, consisting of 12,000 men on a peace footing, and 18,000 men on a war footing.—The army of Belgium is recruited by conscription, to which every male who has completed his nineteenth year is liable; but substitution is allowed. The war footing of this army is,—Infantry, 74,000; cavalry, 7,903, and 6,672 horses; artillery, 14,513, and 4,050 horses and 152 guns; engineers and train, 2,534 men;—total without officers, 69,70 men. In times of peace the strength of the army is pre-

numbers 125,000 men without, and 140,000 men with, the reserve.—The Dutch army consists of infantry, 44,591; cavalry, 4,501; engineers, 1,125; artillery, 10,831; the colonial army consists of 12,287 Europeans and 15,182 natives.—The Spanish army, comprising the active army, the provincial militia, and the national guard, was as follows by the official returns —Infantry, 0,890; engineers, 2,368; cavalry, 11,840; provincial militia, 44,926; carabiniers, 12,002; national guard, 10,330.—The forces of Switzerland are divided into four classes.—I. The Bundesanzug, or federal army, which includes all men capable of bearing arms between the ages of 20 and 32. By the articles of the Swiss constitution, each state is oblined numbers 125,000 men without, and 140,000 men with, articles of the Swiss constitution, each state is obliged to furnish at least three per cent. of its population to the federal army. This class contains 85,138 men. the federal army. This class contains 35,138 men.

3. The army of reserve, consisting of all men who have served in the first class, from the age of 33 to
40. Affout one and a half per cent. of the population are taken for this class, which comprises 50,559 men.

3. The Landwehr, or militia, includes all men between the ages of 41 and 45. This class amounts to 64,823 men.

4. The Landsturm, or army of defence, which comprises all men capable of military service from the age of 45 upwards. The number of men in this class arrounts to about 150,000. Total of Swiss federal age of 45 upwards. The number of men in this class amounts to about 160,000.—Total of Swies federal forces, 350,020 men.—The Turkish army is composed of the Nizam, or active troops, and the Redif, or reserve. At the last return the whole numbered or reserve. At the last return the whole humbered about 216,000 men. — Before the war between the Federal and the Confederate states, the United States of North America possessed a very small army, amounting only to about 12,000 men; but during the struggle between the North and South, the Northerners had in the field an army of 600,000 men; whilst, for a long period, the South was not greatly inferior in numbers.—Ref. Martin's Statesman's Year-Book for 1870.

ARMY AGENTS are persons authorized by government to manage the monetary affairs of the different regiments in the army. Every regiment has its army agent, selected by the colonel, who draws money from the War Office, and applies it to the regular expenses of the regiment. Army agents further pay soldiers' remittances to their families, distribute prize-money, and manage the sale and purchase of commissions.

and manage the sale and purchase or commissions.

AEMY LIST is the name of a publication issued monthly by authority of the War Office, and containing the names of all the commissioned officers in the British army, the Royal Marines, militia, yeomanry, and volunteers, with the dates of their commissions, and other information of a like nature. The Annual Marine Little and the commissions of the sale of the sale of their commissions. Army List is a work of a similar kind, published also by authority, and giving "a list of the officers of the army, and of the corps of Royal Marines, on full, retired, and half-pay." The New Army List, published by H. G. Hart quarterly and annually, is a non-official work, but gives much more information, containing, besides the list of officers in the army and militis, with the dates of their commissions, "a statement of

what the dates of their commissions, "a statement or the war services and wemads of nearly every officer in the army, ordnauce, and marines." Amy Schools.—Of late years much has been done in the way of establishing regimental and garrison schools, for the education of our soldiers and their children. In 1889 upwards of 200 schoolmasters, and a like number of schoolmistresses, were so employed; and the annual sum expended in connection with these schools is nearly £40,000. Besides these, there are schools is nearly £40,000. Besides these, there are certain army educational establishments for the instruction of the officers, and for increasing the military efficiency of the men. The principal of these are the Royal Military Academy at Woolwich, the Royal Military College at Sandhurst, the Royal Hibernian Military School, the establishment at Chatham for the instruction of the Royal Engineers, £c., in military field-works samping mining nontroping the and they

ARMY-WORKS CORPS .- A suggestion was n 1854, during the Crimean war, that a number of skilled labourers, such as railway navigators, miners, and the instruction of the Royal Engineers, &c., in military field-works, sapping, mining, poutconing, &c., and the schools of musketry at Hythe and Fleetwood.

ARMY RETIMATES are estimates which are prepared in the spring of each year by the War Office, of the purpose of assisting the British army which was obliged to winter outside Sebastopol. There was no proper road between the harbour of Blackava and the probable expenses of everything connected with the tion of these, the Secretary of State for War applies to the railway between the two places first suggested the tion of these, the Secretary of State for War applies to the heads of the various departments under him for the heads of the various departments under him for raised and organized the first body of men who went estimates of their probable requirements, and these others, should be enlisted, and formed into a corps for the purpose of assisting the British army which was obliged to winter outside Sebastopol. There was no proper road between the harbour of Balaclaya and the

men; but Lord Raglan soon perceived the value of their services, and wrote home for reinforcements. At the close of 1855 the Army-works Corps comprised 3,500 men. No drilling nor tedious instructions were necessary to teach these men their duty. They entered upon their work fully acquainted with it; and the orperiment was altogether useful and satisfactory, as showing how an army in action can be materially assisted by ordinary workmen.

Arms grant (Res Ards), an inhabitant of the high-

ARNEE, ar-ne (Bos Arde), an inhabitant of the high-lands of Hindostan, and closely allied to the common manus on rinduction, and closely affect to the common wild buffalo. It is remarkable for strength and courage, qualities admirably seconded by a pair of horns measuring from four to six feet in length, and arching in the form of a bold erescent. In Bengal this animal is known as Arris.

ARRICA, ar'.ni.-kä, in Bot., a gen. of plants belonging to the nat. ord. Composita. The most important spe-cies is A. montana, known by the names of Mountain-tobacco, and German Leopard-bane. It is a perennial tobacco, and German Leopard-bane. It is a perennial herbaccous plaut, found growing in the meadows of the cooler parts of Europe, and also of the western states of North America. The florets are of a yellow colour, tinged with brown. The whole plant, when fresh, possesses a strong and disagreeable odour and an aorid, bitter taste. strong and disagreeable odour and an aorid, bitter taste.
All parts of the plant have striking medicinal properties, but the flowers constitute the part generally preferred. The preparation known as tincture of Arnica, which is obtained by macerating the flowers with alcohol, is now largely employed by the public as an external application for bruises; and notwithstanding the contempt with which its powers have been spoken of by eminent members of the medical profession, it has gradually gained ground among practitioners, and will probably be included with other novelties in the revised Pharmacopeia. The flowers, though not much used internally in this country, have been occasionally employed as a substitute for Peruvian bark, and are said to have proved beneficial in cases of amaurosis and chronic rheumatism. Preparations of arnica are much used by the homeopathists.

AROMA, a-ro-ma (Gr., pleasant perfume), the principle in plants or other substances which constitutes their fragrance. In some plants this resides in a vola-tile oil; but in others the portion containing this prin-ciple cannot be detected. It is of an extremely subtle ciple cannot be detected. ciple cannot be detected. It is of an extremely subtle nature, filling the air of rooms, or even the whole atmosphere around gardens; and, although constantly being imparted for years, -as it may be, for instance, in the case of the musk, so as perpetually to fill the air of a well-ventilated room,—yet never causing to the substance from which it emanates any diminution of The aroma of plants is imparted to oils and

spirits by maceration.

AROMATICS, & ro-mat'-iks, substances, as plants, drugs, and medicines, which emit agreeable odonrs, and are usually characterized by a warm pungent taste. and are usually engracterized by a warm pungent taste. Such are the spices ginger, cinuamon, pepper, balsams, frankincense, &c. They generally contain a peculiar volatile oil, mixed with resinous substances. The animal kingdom furnishes some aromatics, as ambergris, musk, civet, &c. They are employed in the manufacture of perfumery, and in medicine as antispasmodies, &c.

AROMATIC VINEGAR, a very popular perfume, the base of which is acetic acid. One of the best recipes for it is

Concentrated acetic acid ... Otto of English lavender ... 2 drachms. 1 drachm. cloves ... ... ...

1 oz.

camphor

The bruised camphor to be first dissolved in the acetic and the perfuses are then added. After being allowed to stand during a few days, with occasional agitation, the compound is to be strained, after which it is ready for use. The most popular of the aromatic production of the aromatic popular of the aromatic production of the aromatic production. ready for use. The most popular of the aromatic vinegars is that of Dr. Henry, the recipe for which is so follows:—Dried leaves of rosemary, rue, wormwood, sage, mint, and lavender-flowers, each \$\dot\ oz.; bruised nutmeg, cloves, angelica-root, and camphor, each \$\dot\ oz.; concentrated acetic acid, 16 oz. The materials to be macerated for a day in the cloth of the acid the acid that the said than to be added allowing the whole

ARROGIO, ar-pedi'-e-o (Ital, from arpa, hsrp), in Mus., signifies reiterated successions of the several notes which compose any chord. The violoncello, viola, violin, and all instruments played upon with a bow, are all the compositions of the several properties of the composition of the compositio are capable of performing an arpeggio; but it is to the harpsichord and pianoforte that its execution more particularly appertains.

ARPENT, or ARPENS ar'-pain(g) (Fr. arpent), an acre or furlong of ground. According to Domesday-book, 100 perches make an arpent. Some account it but half an acre. The old French arpent contained 100 perches,

of 18, 20, or 22 French feet each.

ARQUEBUS, or HARQUEBUS, ar'-kws-bus (Ital. archi-buso, iron bow), was a kind of hand-gun used before the invention of the musket. The carliest hand-guns were fired by applying a match with the hand to the souch-hole. Afterwards a contrivance, suggested by the trigger of the crossbow, was introduced, by means of which the burning match could be instantaneously applied. This was called an aquebus, and is first men-tioned by Philir, de Comince, in his account of the tioned by Philip de Comines, in his account of the battle of Morat, in 1476. On the formation of the Yeomen of the Guard, in 1485, many of them were armed with arquebuses.

ABRACACHA, arra-ka'-ka, in Bot., a gen. of plants belonging to the nat. ord. Umbellifera. It includes one species of great importance, namely, A. esculenta, a plant much a plant much cultivated in the tropical regions of South America for the sake of the root, which is a very valuable article of food. This is about the size of a parsnip, which it somewhat resembles in flavour. It has been recommended as a substitute for the potato, and attempts have been made to cultivate it in Britain, but without any very satisfactory results. The starch obtained by rasping and washing the root is similar to

arrowroot.

ARRACK, ""r"r"k, the name given in eastern countries to any kind of ardent spirit, but which is generally tries to any kind of ardent spirit, but which is generally understood to apply to a spirit made either from rice, or from the juice of a palm-tree. (See Rice, Toddy.) Arrationem Arration-ment (Lat. ad rationem powers; Crd Fr. ad reson, or, abbreviated, a reson, to call to account or answer), in Law, is the calling of the offender to the bar of the court to answer the matter charged upon him. In felonies it is absolutely necessary that the prisoner should attend his trial personally, though it is not so in misdemeanours. The indictment must be read to him distinctly in English although he has had a cony delivered to in English, although he has had a copy delivered to him. He is then called upon to plead "Guilty" or "Not Guilty." If he refuse to plead, the court may order a plea of not guilty to be recorded. (See

ABBEST, ar-rest (Lat. arrestum; Fr. arreter, to stop or stay), it. Law, is the beginning of imprisonment, where a man is first taken and restrained of his liberty by power of the law, with or without the process of some court or legal functionary. Arrests are either in civil or criminal cases, with this difference, that none shall be arrested for any cause of action, suit, or other civil matter, but by virtue of a precept or commandment out of some court; but for treason, felony, or breach out of some court; but for treason, felony, or breach of the peace, every man has authority to arrest without warrant or precept. For contempt of a superior court, the person may be attached or given into the custody of an officer of the court, until the contempt be purged by compliance, or the offended dignity of the court be appeased or satisfied with the punishment undergone. A ciergyman cannot be arrested (except in a criminal matter) in the church or churchyard while attendant there, or in going to or returning from the same for the purpose of Divine worship; and it is a misdemeanour in the party arresting, if he knew the clergyman was on his way to perform Divine service. Barristers, attorneys, and witnesses are privileged from arrest in going to, staying at, and returning from a court or an arbitration in a cause or matter in which they are actually engaged. Peers, by virtue of their numer, cloves, angelica-root, and camphor, each 10z.; described alcohol, 4 oz.; concentrated acetic acid algority, are exempt from arrest in civil cases at all times; and members of the House of Commons are spirit; the acid then to be added, allowing the whole forty days after every prorogation, and forty days to digest during a week. Ref. for several recipes of a before the next appointed meeting. Arrest in all civil cases before judgment is abolished, except the plaintiff can by affidavit show to a judge of a superior court or of a county court, a reasonable presumption for believing that the defendant means to go abroad shortly, believing that the defendant means to go abroad shortly, and to reside abroad; in which case he will grant leave for his arrest by writ of capies, directed to the sheriff. The claim must, however, be £20 or upwards. An action will lie for a malicious arrest. No person can be arrested in a civil case on Sunday. (See Lyquest, Judgment.) Arrest of Judgment.—For defects in substance, appearing plainly upon the face of the record, not amendable nor cured by verdict, the court will in general arrest the judgment. After argument on demarrer, the party cannot move in arrest of iudgment

general arrest the judgment. After argument on de-murrer, the party cannot move in arrest of judgment for any defect or objection of which he might have availed himself on the argument of the demurrer. The motion in arrest of judgment must be made after the exparation of four days from the time of trial, if there are so many days in term; but it cannot be made after the expiration of the term. Defects may be amended. (See Judgment non obstants Verbiller).

ARRONDISSEMENT, ar-rond'-is-mawn(g) (Fr.), a term employed in France to distinguish any portion of and held under the control of civil, military, or ecclesiastical authority. France is divided into departsantical authority. France is divided into departments, which are subdivided into arrondissements, and named accordingly; as the arrondissement of the Justice of Peace, the Maritime Arrondissement, &c. Paris is divided into twelve arrondissements, or mairies, equivalent to the wards of the city of London.

ARROW. (See ARCHERY.)

ARROWHEAD. (See SAGITTARIA.) ARROWHEADED CHARACTERS.

(See CUNBIFORM

Inscriptions.)

Arrowsoot, ar-ro-root, the name given to various kinds of starch used as food by man. True West Indian arrowsoot is obtained from rhizomes or root-stocks of the plant Maranta orundinacea, and is one of the purest and best-known of the amylaceous substances. It forms avery firm jelly with boiling water, and, thus prepared, is a common article of diet for invalids and children. The name arrowroot is derived from the fact of the bruised rhizomes of the plant being employed by the native Indians as an application to the poisoned wounds inflicted by arrows. East-Indian arrowroot is obtained

ARROWROOF PLANT (Maranta arundinacea).

from the rhizomes of angustifolia. Curcuma and is sometimes called cureuma starch. West-Indian plant is, however, cultivated to some extent in the East, and supplies of the true arrowroot are brought from Singapore. Tahitained from the plant named Tacca oceanica, and the substance called Portland arrowroot is extracted the from Arum maculatum, a common hedgeweed in this country. In an inco-cases, the fecula concases, the fecunicists of starch-grains, sists

which are produced in great quantity, before the season of rest, in the succulent rhizomes or root-stocks of the plants. These grains are separated from the cellular risanc, and often acrid juices, by a very simple process, which consists simply in washing the grated root-stocks. Arrowroot is frequently adulterated with potato-starch and refined sugo-flour, sometimes with rice-starch, and the starch of common wheaten flour. The granules of these inferior starches can readily be distinguished under the microscope by their different forms and sizes. (See STARCH.)

ARSENAL, ar'-se-nal (Lat. arx, arcis, a citadel), is applied generally to any place where naval or military applied generally to any piace where naval or military stores are kept, more particularly to a large public establishment where the munitions of war are manu-factured and stored. The great Erglish arsenals are Woolwich, Portsmouth, Plymonth, Deptford, Sheer-ness, and Pembroke. In France, the principal are Cherbourg, Brest, and Toulon.

ARSENIO, ars'-nik (Gr. arsenikus).—The substance which, in commerce, goes by this name, is the oxide of the metal arsenic, or arsenious acid. Arsenic was known in different combinations by the ancients, but has only lately been shown to be of metallic origin. It is, however, so unlike a metal in many of its properties, that certain French chemists consider it as belonging that certain French chemists consider it as belonging to the non-metallic elements. It conducts electricity, and possesses metallic lustre, and is very much allied to phosphorus. Arsenic is prepared in the state of arsenic acid or oxide, by roasting the arsenical sulphide of iron. Metallic arsenic possesses a brilliant grey-lustre, which is unmistakably metallic. It may be reduced to powder in a mortar. When heated in close vessels, it sublimes unaltered; but in a current of air, it absorbs oxygen, and burns with a bluish flame, depositing a white mealy powder. A minute quantity of arsenic is added to lead, to diminish its cohesion, during the manufacture of shot. The only important combinations of arsenic are,—arsenicus acid, AsO<sub>3</sub>, the white arsenic of the shops; arsenite of AsO<sub>3</sub>, the white arsenic of the shops; arsenite of copper, or Scheele's green, a poisonous pigment which ought to be legally prohibited; the Schweinfurth green, ought to be legally prohibited; the Schweinfurth green, which is a double acetate of arsenic and copper; the bisubphide, or realgar, which is used in pyrotechny; and the tersubphide, or orpiment, which is the king's yellow of the artist. Arsenic also forms a terhydride with hydrogen, analogous to the ammonia-like compounds formed by antimony and phosphorus. (For testing for arsenic, see TESTS.) Arsenic forms the connecting link between the non-metallic elements and antimony, which is certainly only a little more metallic than itself. In cases of poisoning by arsenic, freshly-precipitated hydrated oxide of iron, or calcined magnesia, should be at once administered. The inmagnesia, should be at once administered. The influence of a minute quantity of arsenic on the human frame is a very curious question. In Styria, it is a common thing for the peasants to take twelve or thirteen grains per day of white arsenie, to improve their wind. It appears to do them no harm, as long as they relinquish the use of it gradually when they reach 50 or 60 years of age. They begin by taking a single grain per day, increasing the dose until they arrive at their maxing. If the doses are discontinued suddenly. maximum. If the doses are discontinued suddenly, death, with all the symptoms of arsenical poisoning, is

the result. Arson, ar'-son (Lat. ardeo, I burn), at Common Law, is the maliciously, voluntarily, and actually burning the house or outhouse of another man, or wilfully setting fire to one's own house, provided one's neighbour's house is thereby also burnt; and all, not only the bare dwelling-house, but all outhouses that are parcel thereof, though not contiguous thereto, nor under the same roof, as barns and stables, may be the subject of arson. The statute law has made the malicious or wilful setting fire to almost every description of

crous or winth setting the to almost every description of building or property subject to the same punishment as attached to the crime of arson.—See statute 24 & 25 Vict. c. 97, ss. 1 to 10.

ART, art (Lat. are), as distinguished from Science, consists of the truths disclosed by that species of knowledge disposed in the most convenient order for remaining instead of the heat cate for thought. Asset snowing g disposed in the most convenient order for practice, instead of the best order for thought. Art proposes to itself a given end, and, after defining it, hands it over to Science. Science, after investigating the causes and conditions of this end, returns it to Art, with a theorem of the combination of circumstances under which the end desired may be effected. After receiving them, Art inquires whether any or all of those scientific combinations are within the compass of human power and human means, and pronounces the end inquired after attainable or not. It will be obend inquired after attainable or not. It will be observed here, that all that Art supplies is the major premiss, or the assertion that the given aim is one to be desired. The grounds of every rule of Art are to be found in the theorems of Science. An Art can then only consist of rules, together with as much of the speculative propositions (which lose all their speculative look as soon as they come into the artist's hands) as comprises the instillection of these rules. hands) as comprises the justification of those rules. Though Art must assume the same general laws as Science does, yet it follows them only into such of their detailed consequences as have led to certain practical rules, and pries into every secret corner, as well as into the open stores of the household of

### Art and Part

Science, bent on finding out the necessities of which she is in search, and which the exigencies of human life demand. Hence, as Edmund Burke wisely remarks, in his treatise on the Sublime and Beautiful, "Art can never give the rules that make au art." It must always owe them to Science. Whatever speaks in precepts or rules, as contrasted with assertions regarding facts, is Art; and hence it always adopts the imperative mood, whereas Science nearly always adopts the indicative. Science is wholly occupied with declathe mucative. Science is wholly occupied with occu-rations, while Art is wholly engaged with injunctions, that something should be done. Thus, the builder's art desires to have houses, the architect's art desires to have them beautiful, and the medical art desires to cure diseases in the human body.—For further information on this subject, see Mill's Logic, vol. ii. c. xi.; and Dr. Brown's Hore Subsective.

ART AND PART (Lat. ars, cunning, invention; pars, a party in), in Law, is a term used in Scotland and the north of England, when one charged with a crime; committing the same was both a contriver of and

acted his part in it.

ARTANTIE, ar-ion-the, in Bot., a gen. of plants belonging to the nat. ord. Piperacea. The species are natives of the tropical regions of America. The dried leaves of A. elongata regions of America. The dried leaves of A. elongata are much used in medicine. (See MATICO.) The dried fruits of A. adunca are employed as a substitute for pepper. The spikes of fruit of A. crocata are used for dycing yellow.

ATTENISTA, ur-te-mist-i-ii (from Artemis, one of the perpendiction of the perpendiction) in Both according to the perpendiction of the perpendiction.

names of the goddess Diana), in Bot., a gen. of plants belonging to the nat. ord. Compositæ, and comprehending several interesting and valuable species. A. Absinthium, the common wormwood, is an indigenous perennial, often met with in waste places and by roudsides. The flowers are arranged in globular heads, and are of a buff or yellowish colour, blossoming in August. The principal constituents are a volatile oil, a bitter principle called absinthin, and carbonate of potash. The latter was formerly known as "salt of wormwood;" but it possesses no specific virtue other than belongs to carbonate of potash generally : it is still, however, regarded as a patent remedial agent by the agnorant. The dried herb, or flowering-top, under the pame of wormwood, is used as an aromatic bitter tonic, and as an anthelmintic. It is also employed in the preparation of liquetrs. The species A. Abrotanum is the southernwood, a fragrant plant employed on the Continent in making beer. The Persian species A. acetica is said to have the odour of strong vinegar; hence its name. The species A. alba and others are said to serve as nourishment to the herds of the Kirghese and Calmucs. The anthclmintic known by the names Semen-scriphii and Barbotine consists of the flower-Semich-serrom and Darroome consists of the Roma-heads of A. carulescens, a Mediterranean plant. A. chinensis, and other species, are stated by Lindley to yield the Moxa of China. It is prepared from the cottony or woolly covering of the leaves, and used as a cautery, by burning it upon parts affected with gout and rheumatism. (See MOXA.) A. Draenweuler is the tarragon, the leaves of which are used for flavouring vinegar in pickles and salads. A. gallica, termed in France sanguerie or sanguerite, possesses similar properties to the species carulescens. A. indica and madraspatuna, both Indian species, are much used by madruspalana, both Indian species, are much used by the native doctors. A. mutellina and spicata, both Alpiue plants, are said to furnish between them the famous inquor called oreme d'absinthe, which a modern French writer styles "the emerald poison." The substance sold as wormsced, and known under the names of semen-contra, semen-cine, and semen-santo-nicum, consists of the broken flower-stalks, involucres,

nicum; consists of the broken flower-stalks, involuces, and flower-buds of A. contra., paucifora, lercheana, sieberi, and toliuna. It is employed as a vermifuge.

AREKRIOTOMY, ar-te'-ri-o''-o-me (Gr. arteriu, an artery, and temno, I cut), in Surg., is the term applied to the opening of an artery for the purpose of drawing blond, and is distinguished from phlebotomy, or venescation, which is the opening of a vein. In ordinary cases, the latter is always preferable to the former; not sometimes, when it is necessary to take a large quantity of blood from the system very rapidly, as in aborolley, arteriotomy is adopted, and then it is geneapoplexy, arteriotomy is adopted, and then it is generally the temporal artery that is selected.

Autuny, ar'-te-re (Gr. aer, air, and tereo, I keep),

## Artesian Well

is literally an air-duot, and was a name applied by the ancients to certain vessels of the human body, which were believed by them to contain air, from their being were believed by them, to contain an, from the return dening found empty after death. The arteries are those vessels which convey the blood from the heart to all parts of the system. They are membraneous cylindrical tubes, composed of three coats; viz., the external, which is firm, strong, and elastic; the middle, which is firm, attrong, and elastic; the middle, which is muscular, contractile, and brittle; and the internal, which is brittle, smooth, and transparent, and lined with epithelium on the side washed by the blood. The action of the arteries called the pulse corresponds with that of the heart, and is effected by the contraction of their muscular coat and the great elasticity of their outermost one. Besides the arteries which carry the purified blood from the heart to all parts of the body, there is the pulmonary artery, which emerges from the right ventricle of the heart, and carries the impure blood from the heart to the lungs. The other arteries all spring from the aorts. (See Anaromy.) The principal arteries will be found noticed under their respective names.

respective names.

ARTESIAN WILL, ar-te'-zi-in, a well from which water is obtained at a very great depth below the surface of the ground, by boring through strata of various kinds through which water camoot pass, such as clay, to others of a light and povous character, which are charged with water. The flow of water is obtained by hydrostatic pressure. The principles of an artesian well, and the way by which the water is obtained, may be better understood by reference to the accompanying diagram, from which it will be the accompanying diagram, from which it will be presently seen that it would be useless to attempt to bore an artesian well on hills or elevated ground; but that they can only be made with satisfactory results in basin-shaped hollows of considerable extent, the porous strata of which, that contain the water, crop out or come to the surface of the land above the level to which the water is required to rise. Let the figure represent the section of a basin-shaped tract of country, such as the London or Paris basin, and suppose au to be a stratum of clay through which water cannot make its way; bb, an underlying stratum of light

ARTESIAN WELL

sandy formation, or porous chalk-beds, which will contain water; and cc, another stratum impervious to water, like aa. Now all the rain which fails on the surface of the porous stratum at bb, and on all ground above it in elevation, and sloping towards it, from which, if impermeable to water, the rain will trickle down to the porous stratum, will be absorbed by it and held in the same, as the clay stratum as prevents the rising of any springs to the surface of the ground between the points aa, and the stratum cc, of a similar character, prevents the water from oozing away below. In a basin such as that described above, some miles in extent, having impermeable strats lying immediately under the thin surface of the soil, there must necessarily be a deficiency in the supply of water, and it is for these districts that artesian wells are especially serviceable; for if a hole be bored from d to e, the pressure of the water in the parts of the porous tratum bf, bf, above the level ff, will cause the water accumulated below that level to rush through the bore in considerable quantities, and rise to some height above the level gg, the level of the ground at the mouth of the well. Artesian wells are said to derive their name the well. Artesian wells are said to derive their name from the province of Artois, in France, water having been obtained there from wells of this kind from a very early date. There are many in the neigh-bourhood of Vierns, and in the basins of London and Paris; among which may be mentioned those which supply the fountains in Trafalgar Square, and the famous well of Greuelle, near Paris, from which, after boring for eight years, with frequent interruptions arising from the obstructions and accidents that occurred during the prosecution of the work, water was obtained at the depth of 1,800 feet below the surface, a distance of 1,700 feet below the sea-level. The water from this well rushes upwards with such force as to rise 30 feet above the level of the surface, and it is said to have risen at first to four times that height. The temperature of this water never varies, and is about 81° Fahrenheit, or a little more. The French government have caused many artesian wells to be such in different parts of Algeria, round which some of the wandering Arab tribes have settled, and formed villages. The operation is performed by rods from 15 to 20 feet in length, which can be attached to each other by male and female screws. A borifg-tool is fasteneds to the end of the lowest rod, and, to the uppermost one, a lever turned by hand, by which the whole machine is turned round. The machine somewhat resembles a gigantic anger or gimlet, and operates in a similar manner.

ARTHRON, arth-ron, is a Greek word signifying a joint, and, in composition, is used in a number of medical terms; as, arthrosis, an articulation; arthritis, inflammation of a joint, the gout; arthrodynia, pain in a joint; arthroposis, a collection of pus in a joint; arthrodosis, a collection of pus in a joint; arthrodosis, a received into the superficial cavity of another, so as to admit of motion in every direction.

ARTHEODIC, ar-throf-dik (Gr. arthrosis, articulation), in Anat, a term applied to a connection of bones, in which the head of one fits into a shallow cavity in another; by which means motion in nearly every direction is admitted of; as, for example, in the joint between the humerus and the scapula.

ARTHRODIEE, ar-thro-di-se (Gr. arthron, a joint), a term applied to such algae as possess an articulated structure, like Conferva and Oscillatorias.

ARTICHOKE, ar'-ti-choke (Fr. artichaut).—This delicate esculent is the young succellent receptace of the flower-head of Cynara Scolymus, a perennial plant growing wild in the south of Europe, and extensively cultivated in this country. On the continent the artichoke is frequently eaten raw, with salt, pepper, and oil; but in England it is generally boiled before it is sent to the table. (See CYNARA) The esculent tubers of a species of sunflower, Helianthus tuberosam, are known as Jerusalem artichokes; the term Jerusalem being a corruption of the Italian girasole, 'sunflower.' (See ILELIANTIUS.)

Articus, art-ti-kl, in Gram., is a part of speech prefixed to substantives in order to render their meaning more or less defluite. It is derived from the Latin articulas, or Greek arthron, signifying a joint, a term applied by the Greek grammarians to the definite particle, as well as the relative pronoun, as connecting together the parts of a sentence; as in 'I gave you that (or the) book that you asked for; 'the former they called the prepositive article, the latter the postice. The Greek's had only the definite article; the Latins had none, but used, instead, the demonstrative pronouns. In English there are two articles,—the definite the, and the indefinite a or an.

ARTICLE, in Law, signifies a complaint exhibited in the ecclesiastical court by way of libel or declaration. ARTICLES OF THE PRICE are a complaint exhibited

in the courts at Westminster, in order to compel the defendant to find sureties of the peace.

ARTICLES OF THE NAVY are rules and orders made for the government of the royal fleet.

ARTOLES OF WAR are certain regulations incorporated in the annual Mutiny Act, for the government of the military forces of the country, it being considered requisite for the maintenance of exact discipline, that solders who shall mutiny, or stir up sedition, or shall desert her majesty's service, or be guilty of any of the other offences specified in the act, should be brought to more exemplary and speedy punishment than the usual forms of law will allow. For the enforcement of such articles of war, power is given to the crown to convene, or to grant authority to convene, courts-martial, with power to try and punish such offences according to the provisions of the act. There are smilar articles of war issued for the government of the marines and navy; but those applicable to the latter are not included in the annual Mutiny Act.

AUTICLES, THE SIX, in the ecclesiastical history of England, were certain articles of faith imposed by accompany (See ANGLO-CATHOLIC CHURCH)

Caveon.)
ARTICLES, THE THIRTY-NINE, are the articles of religion of the Church of England, agreed upon by the archbishops and bishops of both provinces, and the whole clergy, in the convocation held at London in the year 1562, for the avoiding of diversities of opinions, and for the establishing of consent touching true religion. The substance of these articles was first promulgated in the reign of Edward VI., and formed forty-two in number. Under Henry VIII. as committee had been appointed for the formation of ecclesiastical laws, which was renewed under his successor. It was composed of Crammer, Ridley, and others, who drew up the forty-two articles above referred to, who drew up the forty-two articles above referred to and which were issued by the king's authority in 1553. On the accession of Elizabeth, Parker, archbishop of Canterbury, remodelled these articles, rejecting four of them entirely, and introducing four new ones, and more or less altering seventeen others. The four new ones are the fifth, twelfth, twenty-ninth, and thirtieth, as they now stand. When laid before the convocation of 1562, further alterations were made, and the thirty-ninth, fortieth, and forty-second of King Edward's were rejected. In 1571 the articles were once more revised and ratified. The following is a summary of the several articles:—1. That there is but one true God, and three Persons in the Godhead, of one substance, power, and eternity. 2. That Christ the Sontook upon him man's nature in the womb of the blessed Virgin, uniting the two natures in one person, never of them entirely, and introducing four new ones, and Virgin, uniting the two natures in one person, never to be divided; and was crucified, dead, and buried, to reconcile his Futher to us, and as a sacrifice for sin. 3. That he went down into bell. 4. That he rose again from the dead and ascended into heaven, taking with him his human body. 5. That the Holy Ghost is one in substance, majesty, and glory with the Father and the Son. 6. That the Holy Scriptures contain all things necessary to salvation. 7. That the Old Testament is not contrary to the New. 8. That the three creeds,—the Nicene, Athanasian, and the Apostles,—are to be received and believed. 9, That original sin is the fault and corruption of the nature of every man that naturally is engendered of the offspring of Adam. 10. That in consequence, man caunot, without the grace of God, do what is pleasant or acceptable the grace of God, as what is pieusant or neceptanic to God. 11. That we are accounted righteous before God only for the merit of Jesus Christ by faith, and not for our own works. 12. That good works, the fruits of faith, cannot put away sin, yet are pleusing and acceptable to God. 13. That works done before and acceptable to Got. 15. That works done before justification are not pleasing to God. 14. That works of supererogation, or voluntary works, over and above God's commandments, cannot be taught without arrogance and impiety. 15. That Christ was made like unto us in all things, except in that he was without sin, from which he alone was free. 16. That repentance is not to be denied to such as fall into ain after haptism, or after receiving the Holy Ghost. 17. That God hath from eternity decreed to deliver from curse and dam-nation those whom he hath chosen in Christ. 18. That men can only be saved through Christ; and not, as some say, by the law or sect which they profess, if they be diligent to frame their lives according to that law and the light of nature. 19. That the visible church of Christ is a congregation of faithful men, in which the pure word of God is preached, and the sacraments duly administered according to Christ's ordinance. 20. That the Church hath power to decree rites or ceremonies, and authority in controversies of faith. 21. That things ordained by general councils as necessary to saivation have no strength or authority, unless it may be declared that they be taken out of Holy Scripture. 22. That the Romish doctrines of purgatory, pardons, the worshipping and adoration of images or relies, and the invocation of saints, have no warranty in Scripture, but are rather repugnant to it. 23. That those only can lawfully take upon them the office of public preaching, or ministering the sacraments, who are chosen and called to this work by men having public authority in the congregation so to do. 24. That it is repugnant to the word of God and the custom of the primitive church, to have public prayer,

or to minister the sacraments, in a tongue not understood by the people. 25. That the sacraments are not mere badges or tokens of profession, but rather witnesses and signs of grace and God's goodwill towards us, by which he, working invisibly in us, not only to quicken, but also to strengthen and confirm our faith in him. That there are two sacraments,—baptism and the Lord's suppor; and that those five commonly called sacraments. sacraments, — viz., confirmation, penance, orders, matrimony, and extreme unction,—are not to be counted as such. 26. That the effect of Christ's ordinance is not taken away though ministered by evil but in Ohrist's; and their ministry may be used both in hearing the Word and in receiving the sacraments. 27. That baptism is not only a sign of profession, but also a sign of regeneration, or new birth, whereby they that receive it rightly are grafted into the Church, and the promise of forgiveness of sin and adoption to be sons of God, are visibly signed and sealed. 29. That the Lord's supper is not only a sign of the love that Christians ought to manifest towards each other, but Christians ought to manifest towards each other, but is rather a sacrament of our redemption by the death of Christ; and that transubstantiation is repugnant to the plain words of Scripture. 29. That the wicked, though they do carnally and visibly partake of the Lord's supper, are in nowise partakers of Christ, but rather eat and drink to their own condemnation. 30. That the cup of our Lord is not to be denied to the lay people. 31. That the one oblation of Christ is perfect redemption, propitiation, and satisfaction for all the sins of the whole world, both original and actual: and that the scriffects of masses are blaspheall the sins of the whole world, both original and actual; and that the sacrifices of masses are blasphemous fables and dangerous deceits. 32. That bishops, priests, and deasons are not forbidden to marry. 33. That an excommunicated person ought to be regarded by the faithful as a heathen and publican until he be again openly reconciled by penance and received into the Church. 34. That it is not necessary that traditional deceases he is all places like for the control of the contro tions and ceremonies be in all places alike; for every particular or national church hath authority to ordain, change, and abolish ceremonics or rites of the Church ordained only by man's authority; but that he who, through his own private judgment, doth willingly and openly break the traditions and ceremonies of the Church which are ordained and approved by common authority, and not repugnant to the word of God, ought to be openly rebuked, as he that offendeth against the common order of the Church. 35. That the second Book of Homilies doth contain a godly and wholesome doctrine, as doth the former Book of Homilies, set forth in the time of Edward VI., and are Homilies, set forth in the time of Edward VI., and are therefore to be read in churches. 36. Of consecration of bishops and ministers according to the Book of Consecration, set forth in the time of Edward VI. 37. That the queen hath the chief power in ecclesiastical as well as in civil matters. 38. That the riches and goods of Christiaus are not common; yet every man ought, according to his ability, to give liberally of his goods to the poor. 39. That though vain and rash swearing is forbidden, yet a man may swear when the magistrate requireth, so that it be done in justice, judgment, and truth. judgment, and truth.

ARTICULATA, or ARTICULATED ANIMALS, ar-lik-u-lai-tā (Las. articulatus, jointed), according to the classification of Cuvier, the third great division of the animal kingdom. The great French naturalist subdivided the Articulata into four classes, to which later writers have added four others. The first four of the following classes are those of Cuvier:—1. Annelida, as following classos are those of Cuvier:—I. Annelida, as cleeches, earthworms, &c.; 2. Crustacea, as lobsters, crabe, prawns, &c.; 3. Arachnida, as spiders, mites, secrpions, &c.; 4. Insecta, as butterflies, beetles, flies, &c.; 5. Myriopoda, as centipedes; 6. Cirrhopoda, as barnacles and sea-acorns; 7. Rottiers, wheel-shaped animalcules, aquatic; 9. Entozoa, lowest of the worms, parasites upon or within other animals. (See these words.) The Articulatu derive their names from the fact of their heing composed of segments articulated words.) The Articulata derive their names from the fact of their being composed of segments articulated or jointed together, each segment being formed of one or more rings.

ARTICULATE SOUNDS. (See LETTERS.)
ARTICULATION, ar-tik-u-lai'-shon, in Gram., is a term applied to a consonant, or that portion of a word which can be pronounced by a single movement of the

organs of speech. Hence a good articulation consists in giving every letter and syllable of a word its due pronunciation. Exactness in articulation corresponds to propriety in spelling, and is an object that ought to be aimed after by all. The Greeks and Romans paid particular attention to this subject, which constituted a principal branch of instruction; and the smallest error in pronunciation was regarded by them as disgraceful. An indistinct articulation usually arises from too great precipitancy of speech, or from an improper use of the vocal organs. The latter of these may be cured by attending to the proper position of the tongue, lips, &c., in the formation of each letter; the former

lips, &c., in the formation of each letter; the former is to be got over by continued practice in reading aloud alowly and distinctly.

ARTICULATION, in Anat., is applied to the connection of the bones of the skeleton by joints. (See Anatomy.)

ARTICULE CLERY, artik'-u-ti kle'-ri, are statutes containing certain articles relating to the church and cleryy, made in the 14th Edward III.

ARTICULE ARTICULES ARTICLES OF THE CONTROL OF THE ARTICLES OF THE CONTROL OF THE CO

clergy, made in the 14th Raward 11.

Antificen, ar-tif'-i-ser (Lat. ars, art, and facio, I make), is, literally, one who makes according to art; hence, a skilful workman, a contriver. It is frequently used, however, as synonymous with artisan or mechanic, one who practises manual labour. In this country a mechanic, after serving an apprenticeship, enters at once as a journeyman; but in Germany there intervenes a sort of transition period, during which he has to visit and practise his trade in other places. In many parts of Germany an apprentice cannot obtain his freedom and become a master until he has another a cartier number of reares in following. he has spent a certain number of years in following ne has spent a certain number of years in following his calling beyond his native country. He is furnished with a book, in which his various employers insert certificates of his service and conduct. In his wanderings he is generally assisted and succoured, not only by the trade to which he belongs, but also by the general public. While this system has its evils, it certainly tends to give to the young artisan a greater amount of varied and extensive observation than he could have obtained at home. Latterly, however, the custom has, on account of the evils to which it gives rise, been going out of use; and indeed, from the nu-merous facilities for obtaining knowledge in the present day, there is not the same necessity for it as there was when it was first instituted by the trade guilds in the Middle Ages

the Middle Ages.

ARTHICIAL HORIZON, ar-ti-field-āl (Lat. ars, art, and facers, to make; Gr. arizein, to define), a contrivance by which the altitude of a star, or any heavenly body, is taken by the aid of a sextant or reflecting circle. It is generally made in the form of a circular cop with a flat bottom, about three inches in diameter and half an inch deep, which is filled with unlikeliker on the surface of which a piece of dust is quicksilver, on the surface of which a piece of glass is placed. It is generally protected from the action of the wind by a covering of glass placed in a metal framework. The surface of the quicksilver forms a framework. The surface of the quicksilver forms a plane parallel to the rational borizon (see HORIZON) of the position of the observer, and the augular ele-vation of any object above the true horizon is the angle between the plane of the quicksilver and a line drawn to it from the object, due correction being made for refraction and parallax. To make use of this instrument, the observer must place himself in a position which will enable him to see the object the altitude of which is required and its reflection in the quicksilver at the same time. The angular distance between the object and its reflected image is then measured by means of a sextant, and this result, when corrected for the index error, must be divided by 2, since the reading obtained is double the altitude of the object, as, by the laws of reflection, the image is as much below the plane of the quicksilver as the object itself is shown it, and the contest will express the apparent. is above it; and the quotient will express the apparent altitude of the object observed. Very accurate observations can be taken on land by aid of the artifleial horizon; but it is of little service at sea, owing to the unsteady motion of the vessel.

ARTIFICIAL FLOWERS.—This manufacture has lately

herrical Lowkes.—In manulacture has lately been carried to wonderful perfection, the imitation of natural flowers being so perfect as to mislead even artists. The greatest ingenuity is displayed in the imitation of certain flowers; even a common twopenny sprig consisting of several materials well put together

and arranged. The leaves and petals are generally made of silk or cambric punched out to proper shapes and sizes. These are tinted with a brush and colour, and sizes. These are tinted with a brush and colour, and, if necessary, glazed with gum or sprinkled with fine flock, to imitate the glossy or velvety surface of natural flowers. The ribs, where present, are indented with a warm iron. The stamens and pistils are formed of wire covered with silk, and dipped in gum-water to form the anthers. The stalk is then made of wire. form the anthers. The stalk is then made of wire, coated with green paper, and fixed to the stamens and istil, around which are attached the petals, and, stly, the calyx. Buds are made of cotton or glass alls covered with cambric of a proper colour. The rench excel in this manufacture, and annually export £40,000 worth of these pretty frivolities. Above 4,000 wirls, of different ages, are engaged in London, making blue roses, crimson corn, pink ivy, and other monstrosities, only to be found in the English artificial flower-market. Worse than all, however, the colonsflower-market. Worse than all, however, the colourring matter used for these articles is often nothing less than the deadly poison arsenic. Hofmann and other chemists have shown that the most terrible effects may arise from the employment of these arsenical com-pounds; and it is to be hoped that their use will be speedily discontinued. ARTIFICIAL FUEL. (See FUEL.)

ARTIFICIAL LIMBS, &c .- Ingenious mechanical contrivances for supplying substitutes for those limbs or other organs of the body which accident or misfortune has removed; such as hands, arms, or legs. The skill of the dentist, or the unerring nicety of calculation required by the operator who fixes in an artificial eye, is rather a surgical operation than an anatomical con-trivance; but by artificial limbs is generally meant those combinations of steel framework, screws, springs, cork, leather, caoutchoue, and gutta-percha, which imitate the form, and, to some extent, the motion and practical utility of the real limb. For instance, in 1847, the son of one of Sir George Cayley's tenants lost a hand by accident. Sir George, who possessed considerable inventive talent for mechanical contriv consideration inventive taient for inconsincts contriv-ance, made him an artificial hand, the use of which lessened the severity of his privation. The stump of the boy's arm was introduced into a case or sheath, to one end of which was fixed a spiral spring, and to the other end a bent lever; the middle of the lever was connected with a mechanism of rods which moved the artificial thumb and fingers. By this arrangement the boy had to use his real hand to work his artificial one. By pressing a little button connected with the bent lever, the artificial fingers and thumb opened to receive any object that he might wish to grasp; and when the pressure from the real hand was removed, the grasp took effect without further effort till released by a contrary movement. Afterwards, as it was found inconvenient to take away the real hand from anything else that it had to perform for the purpose of directing the motion of the artificial hand, Sir George Cayley invented an ingenious method of working the mechanical limb by the movement of the shoulder and upper part of the arm.

part of the arm.

ARTHLERY, ar-til-ter-re (Fr. artiller, to fortify), in the most appropriate application of the word, means the camon, mortars, howitzers, and other large pieces for discharging shot and shell by the expansive force of inflamed gunpowder. In a more general sense, it denotes engines of war of all sorts, ancient and modern, by which durts at more shull far are about fourth in

term implies all kinds of missiles employed in warfare, with the machines used in propelling them. The estilest of these military engines were probably used for casting stones of enormous weight. In 2 Chron xxvi. 15, we read of Uzziah, that "he maile in Jerusalem engines invented by cunning men to be upon the towers and upon the bulwarks to shoot arrows and great stones withal." From the writings of Caesar, Cicero, Livy, Seneca, and Tacitus, we gather that the principal engines of artillery of the Romans were the balista, or ballista, for casting stones, and the catapulta, for propelling darts and arrows. Pliny assigns the invention of the balista to the Phoenicians, and the catapulta to the Syrians; but other writers—among them Phito the Syrians; but other writers-among them Plutarch and Diodorus—declare that both machines were taron and Diodorus—deciare that noth machines were invented in Sicily, about the same time as the battering-ram, a date not anterior to E.C. 300. Welearn from Appian, that when the consul Censorinus marched against Carthage, 2,000 engines for propelling darts and stones were surrendered to him. Engines of artillery do not seem to have been known in England earlier than the invasion of the Normans; but the latter appear to have introduced such machines, in the form of contrivances for propelling arrows, at the battle of Hastings. Soon afterwards, inventions for assaulting and defending places became greatly multiplied; and, if the statements of the middle-age chrolings are statements. niclers may be credited, many of these engines posnevers may be credited, many of these engines pos-sessed enormous powers. According to Hemingford, Edward I. employed engines at the siege of the castle of Stirling in 1303, throwing stones of 300 lbs. in weight, Although it can be shown that the explosive force of gunpowder was understood in the East much earlier than the 12th century, the date of its being known to Roger Bacon, yet it was not until long afterwards that firearms superseded the ancient engines of war we have hitherto included as artillery. Colonel Chesney, in his "Observations on Firearms," thus traces the introduction of the new form of artillery into Europe: introduction of the new form of artillery into Europe; —
The Moors, according to Condó, used artillery against
Saragossa in 1118, and, in 1132, a culverin of 4 lbs,
calibre, named Salamonics, was made. In 1157, when
the Spaniards took Niebla, the Moors defended themselves by machines which threw darts and stones by
means of fire; and, in 1157, Abdalmumen, the Moorish
king, captured Mohadin, a fortified city near Bona,
from the Sicilians, by the fame means. In 1280 artillery was used against Cordova, and, in 1306 or 1306,
Ferdinand IV. took Gibraltar from the Moors by means
of artillery. Ibn Nassan ben Bin, of Granada, menof artillery. Ibn Nassau ben Bin, of Granada, monof artifery. Ibn Nassau ben Bin, of Granada, mon-tions that guns were adopted from the Moors, and were used in Spain in the 12th century, and that balls of iron were thrown by means of fire in 1331. Barbour, in his "Metrical Life of Robort Bruce," says that cannon, or "crakys of war," as he terms them, were employed by Edward III. in his earliest campaign against the Scots in 1327. Du Cange asserts that cannon were used by the French at the siege of Puy Guillaume, in 1338; but Rupin, on the other hand, relates, that so unacquainted were the French with these engines of destruction, that four small cannon used by Edward III. at the battle of Cressy, in 1346, contributed, as much by the surprise as the slaughter they created, to the success of the day. The carliest cannon were clumsy and ill-contrived machines, wider at the mouth than at the chamber, and consisting generally of a series of iron bars soldered together lengthwise, and hooped about with iron rings. The projectiles were made of stone. Cannon were first denotes engines of war of all sorts, ancient and modern, by which darts, stones, bullets, &c., were shot forth in battle. (See Cannon, Gurk, Morlar, Ordendard). In the English service, the term signifies the guns and their equipment, the troops serving them, the scientific principles of their construction and employment. Artillery is divided into land artillery and marine artillery. The former is subdivided into field, coast, garrison, and siege artillery. Field artillery accompanies cavalry and infantry, or srue any field-works that may be thrown up; coast, garrison, and siege artillery consist of the heaviest guns that can be brought to bear in each particular case. The term artillery has, since the invention of gunpowder, been restricted to such large ordinance as cannons, howitzers, mortars, and reckets, but including also the restricted to such large ordinance as cannons, howitzers, mortars, and reckets, but including also the weight of the hall they propel. Thus according to the weight of the hall they propel. Thus arons and reckets, but including also the weight of the hall they propel. Thus arons are named at 12-pounder; one that propels a ball of 32 lbs. a 32-troops required for their working, the carriages, ambient of the supplied of the hall they propel. Thus arons are named at 12-pounder; one that propels a ball of 32 lbs. a 32-troops required for their working, the carriages, ambient of the present day, cannon are named at 12-pounder; one that propels a ball of 32 lbs. a 32-troops required for their working, the carriages, ambient of the supplied of the hall they propel.

## **Artillery Company**

VIII., in 1435. The howitzer, an improved form of mortar, was invented by Belidor, and first used at the siege of Ath in 1697. The carronade, the invention of General Robert Medville, was first used about 1779. They take their name from having been first cast at the Carron iron-works. Iron rockets, or, as they are now termed, Congreve, and were employed at the bombardment of Copenhagen. (For an account of the most important of the modern engines of war which come under the head artillery, see ARMSTRONG GUN, WHITWORTH GUN, LANCASTER GUN, &c. For the theory of artillery, see Gunnery. For a description of the various cannon employed in the English and some of the foreign armies, see Ordnance. For a description of the present mode of casting cannon, see CANNON.)

ABPILLERY COMPANY, THE HONOUGABLE, of the city of London, originated about the year 1585, when a number of the citizens, during the fear of a Spanish invasion, voluntarily formed themselves into a company for the defence of the city. When the panic subsided, the company fell into decay; but, in 1611, it was revived by warrant from the privy council, and the about free it myshered 600 volunters. In 1600 in a short time it numbered 6,000 volunteers. In 1640

in a short fine it numbered 6,000 vofunteers. In 1840 the company was presented by the corporation of the City with a piece of ground, near Moorfields, for military exercise. The members are elected by ballot, and pay an annual subscription of one guines to the funds of the company. They protected the Bank of England during the "Gordon riots" in 1780.

ARITLERE PARK is the place in a camp, or the rear of an army, where the artillery is placed. The artillery is drawn up in lines, one of which is formed by the guns, the others by the ammunition-waggons, pontoons, &c.; and the whole is usually surrounded by ropes. This name is also applied to the whole guns, waggons, ummunition, &c., necessary for siege or field waggons, ummunition, &c., necessary for siege or field operations.

ARTILLERY TRAIN, a number of pieces of ordnance mounted on carriages, with all their furniture ready

for marching.
ARTIST, ar'-tist (Fr. artiste), one who is skilled in the exercise of any art, such as painting, sculpture, music, &c.; the professor of any liberal or mechanical art. The term is especially applied to those was follow painting as a profession. In early times, the expression was used to denote a proficient in the seven liberal arts which formed the complete course of study at the universities; namely, grammar, logic, Thetoric, arithmetic, music, geometry, and astronomy.

By Paracelsus it is used to signify a chemist, or rather alchemist. At Vicenza, an old custom existed of allowing any skilful artificer, convicted of a capital offence for the first time, to save his life if he could show himself to be a workman of consummate skill in the exercise of his craft or calling.

ARTOCABPACER, ar'-to-kar-pai'-se-e (Gr. artos, bread, karpos, fruit), in Bot. a nat. ord. of dicotyledonous plants, consisting of 30 genera and about 60 species,prairies, consisting of the general and regions, baring a milky juice, which contains caoutchous, or Indiarubber, dense heads of unisexual flowers, and, generally, fruits of the corosis form. The typical genus, Artocarpus, or Bread-fruit, includes two very important food-producing trees, namely, A. incieu and A. integrifolia. The first species is a native of the Molucas and islands of the Pacific: it yields, the nutritious bread-fruit which supplies the place of corn to the natives of the regions in which it flourishes. This fruit is green, and of the size of a large melon. Several varieties are known, the best being that which is free from all spines on the surface. The nuts found inside the fruit are roasted and eaten; but these are not so highly valued as the fleshy receptacle, which forms the broad of the South-Sea Islanders. When roasted, this becomes soft, tender, and white, resembling the cramb of a loaf; it must, however, be eaten new, as, by lessing, it becomes hard and choky. The bread-fruit tree was introduced by the British government into the West Indies, where it is still enlivated; whence it has been carried to the American continent. The species A. integrifolia yields the Jak, or Jack-fruit, decorated, to illustrate ornamental act; and there is an excellent library in connection with the institution, parts of the East. This is very prickly, and weighs

## Arts, Manufacturing

from 60 to 70 lbs. It has a rather offensive odeur, and is little relished by Europeans; the nets, however, when roasted, are generally liked. The inner wood of the tree is used to dye the robes of the Buddhist priests yellow. The bread-fruit and jack-fruit are good examples of the sorosis, and each affords an instance of a fruit which grows most freely, and becomes best adapted for food if proportion to the absence of seeds. (See Sonosis.) The nat. ord. Attocarpuces includes other interesting genera, which are noticed under the botanical names. (See ANTIARIS, BROSIMUM, PRYTOCREME.) TOCKENE.

ARTS, DEGREES IN. (See DEGREES.) ARTS, FINE. (See FINE ARTS.)

ARTS, MANUFACTURING.—This term is employed to distinguish a certain class of manufactures of a scientific and ingenious nature, from others which only require manual skill and dexterity. The line of de-marcation between the fine arts and the manufacturing arts is undefined, and in many respects they blend together. From the period of the 17th century, science and art have been drawn more closely together, and in later years have made rapid progress, each nutually assisting the other. The establishment of schools of art in connection with manufactures is only of recent date in England; but the manuer in which all classes have aided and supported the various schools of design and mechanics' institutions shows that the nation appreciates the value of cultivating manufacturing art. We see the same thing, also, in the great success which has attended the production of popular works on science in modern times. The discoveries of photography and electro-plating form closer bonds between science and art. For the last closer bonds between science and art. For the last thirty years, the British government has applied annually for a grant in aid of scientific and artistic education, which has been variously applied; but the Museum at South Kensington, which was suggested and corried out by the late raugh lawage and grant of the late raugh lawageted. Attachm at South Kensington, which was suggested and carried out by the late much-lamented Prince Consort, is the most important result of late years. By means of this institution, and others of a like obsracter, a knowledge of science and art is disseminated among the workmen and workwomen of the kingdom. Another step in the same direction is the appointment of eminent sculptors and painters, in order to design models and parterus for manufactures. Although it is only recently that this country has turned its attention to the furthering of manufacturing art, other nations in Europe lave long acknowledged its importance. This Great Exhibitions of 1851 and 1862 by bringing our weakloads in contractivity. 1862, by bringing our workmen in contact with foreign workmen and their work, gave an impulse to our skilled manufactures. In France, more attention is paid to the artistic education of artisans than in any other country, and we see it reflected in all their handicraft. The Conservatoire des Arts et Métiers, in Paris, is a most remarkable institution. It consists of a number of large halls, each of which is devoted to some particular trade, or branch of manufacture, and contains a perfect collection of the raw and the manufactured produce, together with all the implements employed in the process. A lecturer is appointed to each hall, for the instruction of the people. It has been in existence more than sixty years, and was first suggested by the celebrated philosopher Reno Descartes, early in the 17th century. The government is so convinced of the importance of this establishment, that it supports it with an annual grant of 150,000 frances. The selection and arrangement of the objects in these halls are very interesting, since, by exhibiting the implements and muchines that have been used from mediaval times up to the present day, the gradual improvement can be noted at once. In one department, porcelain and china ware in all stages of

undertaking as this, and the Museum of Science and Art at Kensington is a step in the same direction. England, however, took the initiative in the Exhibition engiand, nowever, sook the interest in the Lambition of 1851, and her example was followed by most of the principal nations in Europe, and also by America. The usefulness of such meetings was asknowledged, and now it is felt that if the workman receives sound instruction in science and art, it not only adds to his intelligence and comfort, but also secures the pros-

perity of our manufacturing arts.

Aut-Unions, institutions formed with the object of Aut. Unions, institutions formed with the object of promoting a more liberal patronage of, and a livelier interest on the part of the general public in, the fine arts. The original notion or foundation of syntunious belongs to France, in the days of the first Napoleon. They were alterwards established in Belgium, and, the statement of the state ten years later, were encouraged and adopted in Germany. The art-union of Malines commenced its operations in 1812; that of Munich in 1823. The eminent Alexander von Humboldt, who took great interest in these institutions, recommended their adoption; and his advice was carried into effect in Leipsie, Dresden, Berlin, Halberstadt, Breslau, and other towns and cities, and, in 1833, nearly every important town in Germany could boast of its art-union. Since then, groups of associations, each including several towns, such as Hanover, Cassel, Brunswick, Gotha, Halberstadt, Mag-deburg, and Halle, have been formed for the encouragement of works of the highest class of art; and the influence of these asthetic associations in improving and refining the general public taste, by the collection and distri-bution of modern works of art, has been most powerful and beneficial. From Germany art-unions were intro-duced into England, where they were formed in the hope of offering to artistic genius and talent a higher aim and purpose than mere imitation. Portraits had long formed the principal means of subsistence to the painter. Pictures of Scriptural, classical, historical, or romantic subjects, were uncared for. The public neglected ideal art, and were indifferent to everything but the reproduction of the objects most familiar to them. A witness examined before a select committee of House of Commons in 1845 stated, that before the the establishment of the art-union in Dublin, "in four cars, during the exhibition of the works of the Roval years, during the exhibition of the works of the moyal Hiberuian Academy, 20s. only were expended on the patronage of art." "30s. annually?" inquired the chairman. "No," replied the witness; "30s. was the entire sum expended in the four years." As a proof of the success that has attended art-unions, in 1856 they expended the sum of £1,000,000 stering in the encouragement of art; in addition to which extraordiencouragement of art; in admitton to which extraoran-mary fact, the purchases of private individuals greatly increased. The constitution of art-unions, which, with some few exceptions, is common to all, is as follows:--Every member pays an annual sum, -- in England usually one guinea, — na return for which he receives an acknowledgment, which serves the purpose of a ticket in the lottery, by means of which the pictures, statues, and other works of art purchased with the whole sum thus contributed, are distributed among the different members. A certain amount of the money is generally kept in hand, and applied to the execution of an engraving, a copy of which is presented to each of those members who have drawn a blank in the lottery. This engraving is usually the work of a local engraver. An exhibition of the works of local artists, though lately the majority of associations have admitted those of strangers, takes place once a year. The method of distributing the funds of the unions varies in different places. In London the money itself is distributed by lot, and the holders of prizes are compelled to expend it on the pictures exhibited, the selection being left to it on the pictures exhibited, the selection being left to their own judgment. On the Continent, the whole sum collected for the year is placed in the hands of a committee of gentlemen, elected for their artistic tastes and acquirements, who select works of art, which are distributed to the subscribers by lot. Con-siderable controversy has arisen between the partisans of the two systems, and it may be presumed that each method is best adapted for its locality. On the Con-tinent and in Edinburgh, the members of art-unions prefer to have their prizes chosen for them by compasiderable controversy has arisen between the partisans of the two systems, and it may be presumed that each method is best adapted for its locality. On the Continent and in Edinburgh, the members of art-unions that in Edinburgh, the members of art-unions prefer to have their prizes chosen for them by competent to have the hard the prizes chosen for the prizes chosen for them by competent to have the hard the prize chosen for them by the hard them below the hard them below the hard them by the hard them below the hard them below the hard the

ARTM, air'-use (formerly aron, supposed to be sa ancient Egyptian word), in Bot., the typical gen. of nat. ord. Araces. The only British species is A. macidatus, the common Cuckoo-pint, Wake-Robin, or Lorde-snd-Ladies, and probably the Long Purples of Shakspers. This curious perennial is found growing in shady places, hedge-banks, rough grounds, and groves: The flowers, which come to perfection in April and May, are momecious; that is, the seres are contained in different flowers on the same plant. They are arranged on a succulent axis, terminating in a club-shaped receptacle termed a spadix, of a purple or yellowishreceptacle termed a spadix, of a purple or yellowieb-white colour, and inclosed in a membranous sheath denominated a spathe. The berries are of a fine scarlet colour, and help to adorn our hedges in autumn. They are very poisonous, and the whole plant contains acrid and poisonous juices. The tubers, which are filled with starch, are dried, powdered, and used in France as a cosmetic, under the name of cypress powder. The as a cosmette, under the name of cypress powder. The starch, separated from acrid juices, forms Portland arrowroot, which was formerly prepared in large quantities in the island of Portland, where the plant grows in great profusion. In the fresh state, the tubers are stimulant, diaphoretic, and expectorint, and were formerly used in the form of an emulsion in obstinute rhenmatism.

ABUNDELIAN MARBLES, ar-un-de'-li-an, a collection specimens of Greek and Roman sculpture, mad of specimens of Greek and Roman sculpture, made between the years 1607 and 1614, by Thomas Howard, earl of Arundel and Norfolk. His grandson Henry Howard, who subsequently became duke of Norfolk, presented part of this valuable gathering of the relies of antiquity to the university of Oxford, in 1607, at the suggestion of the celebrated John Evelyn, who, with Mr. (afterwards Sir William) Petty, was engaged by the earl to render assistance in the laborious undertaking. The collection in its entire state numbered 37 statutes 128 houts and 250 pieces of markles bered 37 statues, 128 busts, and 250 pieces of marble bearing inscriptions; besides afters, sercoplagi, and fragments of various kinds, end a cabinet of gens, meduls, and intaglios, acquired at Venice for the sum of £10,000. Lord Arundel left England for Autwerp at the commencement of the civil war between King the commencement of the civil war between king Charles I, and his parliament, taking with him the more portable portion of his collection, such as his gens and smaller pictures. After the death of Charles, a great number of the statues and paintings still remaining in Arundel House fell into other hands at the general confiscation of royalist property ordered by the Commons, and only a small part of the original collection, including the famous Parian chronicle, was handed over to the university of Oxford. The specimens that still remained in the possession of the Arundel family were disposed of at various sales, and some were purchased by Sir William Fermer, whose som became first earl of Pomfret, and were alterwards presented to the university of Oxford, in 1755, by Henrictta Louisa, dowager-countess of Pomfret, when they were placed with the inscribed marbles that had previously come into the possession of that body. The Parian chronicle was acquired by purchase at Smyrns, by Sir William Petty. It contained in its perfect state a chronological table of the leading events in Grecian history, from 1582 B.C. to 264 B.C. A part is lost, and the remainder is much injured and defaced in many places. It is supposed to have been cut in the isle of Paros, about 263 B.C., the period of time at which the record ends,—Ref. Selden's Marmora Arundelliana, 1628; Prideaux's Marmora Ozoniessa, 1676; Chandler's Marmora Oxoniensa, 1763.

ABUNDO, d-run-do (probably Lat. arundo, reed, or from Celtic aru, water), in Bot., a gen. of grasses, the species of which frequently attain a considerable size, and are found in many climates. A. phragmites, the common reed, is a well-known species, the culms being largely employed for thatching and other useful

tweive connecs, or one pound. The oldest form of the as,—that coined in the reign of Servius Tullus,—bore the figure of either a bull, ram, sow, or boar upon it. Afterwards asses had upon one side the two-faced head of Janus, and upon the other the prow of a ship; whence the phrase made use of by Roman boys whether the phrase made use of by Roman boys whether tossing up,—"Capita ant navim" (heads or ship). In the first Punic way 2814, 12, the the which the second of the phrase way 2814, 12, the second of the phrase which the second of the phrase way 2814, 28 tossing up, "Capita ant navim" (heads or ship). In the first Punic war, 264—241 n.c., the as, which till then had weighed twelve ounces, was coined of the same weight as the sextans, or two ounces; and Pliny informs us, that by this means the republic was enabled to liquidate its debts. Under the dictatorship of Q. Fabius Maximus, 217 B.C., the weight of the as was diminished to one ounce. Previous to the reduction cummissed to one ounce. Frevious to the reduction to two ounces, ten ssees were equal to a denarius, the principal silver coin among the Romans,—that is, to about 54d. English. (See Denarius.)

Assersa, dis-d-gre-d, in Bot., a gon. of plants belonging to the nat. ord. Melanthacea or Colchicacea.

The most important species is A. officinalis, a native of Mexico, and the principal, if not the only source of the Sabadilla, Cevadilla, or Cabdilla of the shops, which consists of the fruits and seeds. The seeds are officinal, and yield the alkaloid veratria, which has been used externally as a rubefacient in rheumatism, gout, and neuralgic affections, and also internally in similar cases, in doses of one-twelfth to one-sixth of a grain. It is a most powerful poison. Sabadilla seeds ave been employed as an anthelmintic. They are called lice-seeds by the Germans; because, when powdered and applied externally, they destroy vermin.

powdered and applied externally, they destroy vermin.

ABRECTIDA, or ASSIGETIDA, is-siz-je-it-id (Persian, asa; Lat. fostidus, fetid), the name of a fetid
gum-rosin, used in medicine on account of its antispasmodic and more or less stimulating properties,
and extensively employed in Persia and the adjacent countries as a condinient, just as garlic and other allied plants are employed in Europe. The umbel-The umbelliferous plant Narther, or Fernia asafatida, yields the greater part of the asafatida of commerce; but, in all probability, other species of Ferula, and also other plants, yield the drug. Royle suggests that Prangos pabularia may be one of the sources. The peculiar,

pabularia may be one of the sources. The peculiar, and, to Europeans, offensive odour of seafactids, is attributed to the presence of sulphur in combination with allyle. See ALLYLE.

ASAPUS, See ALLYLE.

Aristotochiacea. The species A. europaum, a native Aristotochiucea. The species A. europaum, a native of Europe, is a rare plant in the woods of Britain. of Europe, is a rare plant in the woods of Britain. The root which forms the drug asarabacca contains a camphor-like principle, and a bitter principle called asarin, which is combined with gallic acid. It was formerly much employed as an emetic, but has been superseded by ipccaouanhs, which is milder and safer. It is still occasionally used as an errhine,—that is, a medicine to be snuffed up the mose, in headache and ouththalmia, and is supposed. nose, in headache and ophthalmia, and is supposed to be the chief ingredient in the powder sold as cephalic anuff. The species A. canadense, the Canada snakeroot, or wild ginger, is another medicinal plant, the rhizome being used in the United States as a tonic, disphoretic, and aromatic stimulant.

ASERTOS, dis-best for (Gr. asbestos, incombustible), a fibrous variety of hornblende, so soft that it can be spun and woven into fabrics. It is remarkable for being incombustible; and for this reason it was nor peng incombustible; and for this reason it was used by the ancients for wrapping up their dead before placing them on the funeral pile, in order that more of their ashes might be lost. They also used it for napkins, which, when soiled, were passed through the fire. They likewise used it for lamp wicks. It has received but few applications in modern times. Chemically it is a silicate of magnesia and alumins. The localities in which it is found are

### Ascension-Day

numerous. It was so plentiful in Coraica some years ago, that it was used for packing instead of tow.

ASCARINES, ds.kir'-i-dees (Gr. askurico, I jump),
parasitic worms which inhabit the intestines of snimals. They belong to the genus Entozoa, and are ranked in arey octong to the genus Envisor, and are ranked in the order of Numariolea. One of the common estspecies, the A. lumbricoides, which is very like the common earthworm, is found frequently in the intestines of men, and of horses, oxen, &c. They have been observed fifteen inches in length, and they are often the cause of facern diseases which has committee around fatal. The of severe disease, which has sometimes proved fatal. The mouth of this worm is only formed for suction; hence it is unable to injure the coating of healthy intestines. In a very young state, ascarides have never been found either in man or the other animals. Persons laving in damp valleys are said to be most liable to suffer from them. The A. vermicularis, or threadworm, is very common among young children. It is white, and about half an inch long. It infests the lower part of the intestines in great numbers. (See VERMIFUCE, THEELDWORM.)

ASCENDANT, is-sen'-dunt (Lat. ascendere, to rise upwards), a term in Astrol., applied to the first or strongest house in the scheme of any person's nativity. The ascendant is so called from containing the eastern point of the horoscope, or the degree of the ecliptic rising on the horizon at the time of birth. This was imagined to exercise considerable influence on a pers life and career, according to the supposed nature or power for good or evil of the planet or sign of the ecliptic about to rise at that time, and the relative position of these and other heavenly bodies to each other in all parts of the heavens at that moment. (See

ASCENSION, RIGHT, is-sen'-shun (Lat. ascendere, to rise upwards), a term in Astron. The right ascension of any heavenly body is the arc of the celestial equator intercepted between the first point of Aries and the meridian or circle of declination passing through the object, or the distance east from the meridian, passing through the first point of Aries measured on the equinoctial or celestial equator. It corresponds with longitude on the terrestrial globe; and as the position of any place on the earth is deter-mined by its longitude and latitude, so the position of any object in the heavens is determined by its right ascension and declination. (See DECLINATION.) The right ascension of any heavenly body is ascertained by the aid of a transit-instrument and sidereal clock, the the aid of a transit-instrument and sidereal clock, the former showing its passage across the meridian, and the latter indicating the time when the passage takes place. The sidereal clock beats seconds, and is so constructed and regulated, that the hour hand describes a complete revolution in 24 hours from the time of the passage of any star across the meridian to its return to the same point. The heads across the same control of the same con the passage of any star across the meridian to use return to the same point. The hands are set at 0h, 0m, 0s., when the first point of Aries is on the meridian, and the time shown by the clock when any other celestial body passes the meridian is therefore its right ascension, or distance from the first point of Aries in time; and if the time shown be multiplied by 15, the distance in degrees, minutes, and seconds is obtained. Oblique ascension is the arc of the celestial equator intercepted between the first point of Aries and that point of the equator which rises at the same and that point of the equator which rises as the same time with any heavenly body. Ascensional difference is the difference between the right and oblique ascen-sion of any object. The terms oblique ascension and ascensional difference are old expressions, seldom used in the present day: the latter was chiefly applied to the sun, because the sun's ascensional difference converted into time shows how much he rises before or after six o'clock.

ASCENSION-DAY, one of the great religious festivals of the Episcopal as well as of the Roman Catholic of the Episcopal as well as of the Koman Ustnoice church. As its name denotes, it is intended to com-memorate the ascension of our Lord into glory, after his last appearance upon earth. Ascension-day has been observed in the Church from the earliest times, and is believed by some to have been instituted by the Apostles themselves, or their immediate successors. It is held on the Thursday next but one preceding Whit-Sunday; and is hence also termed Holy Thursday. The week in which it occurs is usually called Bogation week, from the rogations (petitions or litenies) which

were anciently used by the minister of each parish in perambulating his district, which he did on Ascen-sion-day, or on one of the three days immediately preceding it.

preceding it.

Ascartoss, is-self-i-ei-zm (Gr. askeo, I exercise),
signifies nowadays those who exercise themselves in
the contemplation of divine things; but among the
Greeks, with whom the word originated, it was applied
to those athletes and wrestlers who were accustomed, by rigid abstinence from all sensual and effeminating indulgences, to harden their bodies for the personal induigences, to inside their boutes for the personal contest in the public games of the country. This is the primary signification of the word; but it soon came, among those with whom it originated, to bear a deflected or secondary meaning. In the schools of philosophy, and particularly among the Stoics and Cynics, it came to be applied to that severe discipline to which those persons subjected themselves, by mas-tering their passions and desires for the sake of that tering their passions and desires are the sake of their ideal virtue which they all sought. From these philosophers it gained a tertiary signification in passing to the Christians. Among them it was applied to all who wrestled with Satan, with the world, and with the flesh, and thus endeavoured to exalt themselves by a severe course of personal renunciation above this world, where they were strangers and sojourners. But the earliest ascetics we read of had an eastern origin. The Brah-mins and other sects in Asia carried this practice to a monstrous extent, since long before authentic history The yogis and fakirs of the present time, the suicides in the sacred Ganges and under the wheels of the car of Juggernaut, are only a repetition, in a civilized age, of what was done by their remote ances-tors long anterior to any authentic record we have of the country. The Buddhists, who generally dwell the country. The Buddhists, who generally dwell considerably to the cust of India, carried the principle of asceticism to a great height. They despised the world: they lived a life of solitude and beggary; they mortified the flesh, and abstained from all uncleanness. And so they do to the present day. The Chinese, the Persians, and even the Egyptians, have contemplated life usually in a much more just way, and have not carried their asceticism to anything like the same ex-treme. In the early centuries of Christianity, the ad-herents of the comparatively new religion were more exemplary for purity of morals than for the practice of ascetic severities. But before long, in Egypt and else-where, they endeavoured to escape from the sinful world in which they lived, and, by fasting and prayer, sought for divine aid around the shores of Lake Marcotis and in other parts of the Christian world. Asceticism assumed a more intellectual shape among the Neo-Platonists of Egypt than it has ever done in any other part of the world. Its greatest names are Philo, the Jew, the father of the system, Plotinus, Porphyry, Iamblichus, and Proclus. Philo has left us a history of it in his De Vitá Contemplativa. Even in the 2nd century of the Christian era we find societies of men and women living together under vows of continence.
Thetendency to outward manifestation and to inward and spiritual life began to decline in Christian communities.
This gave rise to the wholesale system of monasticism, which withdraws men and women from the world, under the mistaken idea that thereby they can promote better the aim and end of human life; and immures them in separate establishments, and within separate inclosures, under the idea that they are there kept away from the evil that is in the world. The Greek church has kept much free from ascetic practices than the Romish one; and even the Mahomedan system has melted to some extent under the thawing tendency of modern civilization. The Waldenses of the 11th century, the Menuonites and the Shakers, the Methodists and the Quakers, and the modern Sisters of Mercy, have all had more or less of an ascetic spirit clinging

Ascians, āsh'-i-āns (Gr. a, not, and skia, shadow), a term applied to those inhabitants of the globe who at certain times of the year have no shadow. Such are the inhabitants of the torrid zone, where the sun being twice a year in its zenith,—in other words, being perpendicular to their heads,—no projecting shadow is thrown.

seas, belonging to Cuvier's order Acephala, without shells. They have two orifices, by means of which they breathe and feed : one is branchial, the other anal. They are encased in a soft leathery tunic, inclosing a second mantle or tunic, which is muscular, and adheres second mantile or tunic, which is muscular, and adheres to the first only near the orifices. Their nature is very spathetic, and they remain fixed to a rock or a piece of seaweed, living upon the animalculae which are drawn in with the water that is constantly passing through their ciliated respiratory organs. The action of the cilia seems to be involuntary. The screes of ascidians are distinct; and their chief nervous centre is airmated between the openings of the muscular tunic is situated botween the openings of the muscular tunic. In 1828 MM. Milne-Edwards and Audouin discovered In 1829 MM. Milne-Edwards and account that an ascidian does not begin life as a fixed animal, but was able to more about like tadpoles, by means of but was able to move about like tadpoles, by means of a vibrating tail. After a time it attaches itself to a plant or rock, and the tail disappears. Many of the ascidians are splendidly coloured, and often cling about seaweed like bunches of strange fruit. They are divided into two classes,—compound and solitary ascidians. (See ZOOPHYTE, POLYPE.)

ASCITER, üs-si'-tese (Gr. askites, from askos, a bottle), a term employed in Med. to denote abdominal dropsy, or dronay in the helly. (See INDERS.)

a term employed in Med. to denote addominal dropsy, or dropsy in the belly. (See DROPSY.)

ASCLEPIAD, äs-kle'-pi-ild, in Ancient Poetry, is the name of a species of verse, so called after Asclepiades of Tragilos, in Thrace, a soholar of Isocrates. He wrote some tragedies, fragments of which still remain. The verse consists of four feet, of which the first is a spondee, the second a choriambus, and the third and fourth dactyls, as in the following line from Horace:—

Mæccinās atāvis | ēdītē | rēgībūs.

ASCLEPIANCEE, as-kle-pi-d-dai'-se-s, in Bot., the Asclepias or Milkweed ord. of dicotyledonous plants, included in the sub-class Corolliflora,—shrubs or trees commonly lactescent, and frequently with twining stems. The order is at once distinguished by a curistems. The order is at once distinguished by a currously-formed five-cornered stigms, and by the grains of pollen cohering in wax-like masses, which, when the anther dehisces, become attached to glands at the angles of the stigma. There are 157 genera and about 930 species, which are mostly tropical, abounding in South Africa, India, and equinoctial America. Some are cultivated in British gardens and bothouses for the cake of the heart fifth or writing flowers the base. Of are cultivated in British gardens and hothouses for the sake of the beantiful or curious flowers they bear. Of these the most familiar are different species of Asclepius, or Swallow-wort, the beautiful and fragrant Stephanoits floribunda, and the climbing Hoya carnosa. Nearly all the plants of this order have acrid juices, which render them stimulating, emetic, purgative, and diaphorotic medicinal agents. The milky juices of many species contain caoutchoue or India-rubber. Some species yield useful fibres, others edible tabers, and one (the cow-plant of Ceylon) a nutritious milk, which is used as food. (See ASCLEPIAS, CALOTROPIS, CYMANCHUM, HEMIDESMUS, GYMNEMA, and MARSDE-MEA.)

ASCLETIAS, ŭs-kle'-pi-ds (Gr. name of Esculapins, the god of medicine), in Bot., a gen. of plants, the type of the nat. ord. Asclepiadaces. The common English name for the gen. is Swallow-wort. The species are mostly American, and many of them poscess powerful medicinal qualities, as one might expect from the generic name. They are herbaceous plants, seldom of a twining habit, with opposite, whorled, or alternate leaves, and flowers arranged in simple umbels between the leaf-stalks. The corolla is five-parted and relieved. The stamens five in number, alternate with reflexed. The stamens, five in number, alternate with renered. The stamens, are in numer, alternate what the lobes of the corolls, and have curious horn-like appendages. The species A. syriaca, Syriau or Virginian swallow-wort, was formerly thought to be a native of Syria, but is now regarded as an American plant. The white acrid juice of this plant contains esoutchout. The seeds are covered with down, which is frequently employed in America for making wadding term applied to those inhabitants of the globe who at certain times of the year have no shadow. Such are the inhabitants of the torrid zone, where the sun being twice a year in its zenith,—in other words, being perpendicular to their heads,—no projecting shadow is thrown.

Acoustants, as-sid-i-ans, a term usually employed to distinguish a genus of molluscan animals, found in all from the stems of A. tenacissma the Jetee or Toalist the same of the stems of A. tenacissma the Jetee or Toalist the same of the stems of A. tenacissma the Jetee or Toalist the same of the stems of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of A. tenacissma the Jetee or Toalist the same of the

goose fibres are obtained. The root of A. tuberosa is much esteemed by the American doctors, particularly by those styling themselves eclectice, as a disphoretic and expectorant. The last-named plant, which is commonly known as the batterfly-weed or pleurisyroot, is frequently cultivated as an ornsmental gardenflower. In Arabia the young shoots of A. stipitacea are eaten like assurance. are eaten like asparagus.

Ashlan, or Ashlen, ash'-lar (Ang.-Sax.), a term in Masonry, applied to stones, whether rough, as when taken from

the quarry, dressed. or when used for the facing of walls, which may be plain, tooled, orrusticated. In Nicholson's Ar chitectural Dictionary, laring is used to signify the

ASHLAR. operation of bedding the slabs of stone employed for facing brick or rubble walls; and asklering as a technical term in Carpentry for the short pieces of upright quartering used in garrets to cut off the acute angle between the floor and the sloping rafters of the roof.

ASHORE, histor, in Mar., a term used to signify on land, as opposed to aboard. A ship is said to be

ashore when she has ran upon the ground or on the sea-coast, either by accident or design.

ASH-WADNESDAY is the name given to the first day of Lent, from the Roman Catholic ceremony of strewing sense on the head as a sign of penitence. The ashes used on this day are said to be those of the palms conservated on the Palm-Sunday before. The ashes are first conservated on the alar, then sprinkled with holy-water, and afterwards strewed on the heads of the priests and the assembled people, the officiating priest repeating the words, "Remember that thou are dust, and shalt return to dust." The ceremony is said to The ceremony is said to have been introduced into the Church by Pope Gregory

service is appointed to be read on this day, containing the owners denounced against imponitent sinners.

ASIATIC SOCIETIES, dis-bli-bl'-bl, pre certain societies that have been formed for investigating the lanties that have been formed for investigating the languages, literature, history, antiquities, &c., of Asia. Some of these exist in Asia, others in Europe. The oldest society of this kind is the Bataviaasch genootschap van Kunsten en Wetenschapen, founded in Batavia in 1731. It was speedily followed by the Asiatic Society of Calcutta, which was founded by Sir William Jones, for the purpose "of inquiring into the history, civil and natural, the antiquities, arts, sciences, and literature of Asia." The first volume of its pro-

142

ceedings was published in 1788, under the title of the Asiatic Researches, and the series was continued up to vol. xx., published in 1836. In 1832 the society issued vol. is of the Journal of the Asiatic Goelety of issued vol. is of the Journal of the Asiatic Society of Bengal, a work which is continued down to the present time. In 1804 the Literary Society of Bombay was instituted, under the presidentship of Sir James Mackintosh, and was followed by the Literary Society intosh, and was followed by the Literary Society of Madras. The first Asiatic Society founded in Europe was the Société Asiatique of Paris, which, in 1822, commenced the publication of the Journal Limitique, a work which still appears regularly. In 1823 the Royal Asiatic Society of Great British and Ireland was founded, and in 1824 received a royal charter: since 1834 it has regularly issued a Journal of Transactions. In 1845 the German Oriental Society, Decische Morgeniändische Gesellschaft, was instituted at Leipsie: it publishes annually a journal of proceedings. sic: it publishes annually a journal of proceedings. In 1812 an American Oriental Society was founded at Boston. The most recent of this class is the Societé Asiatique, established at Constantinople in 1852. Most of these societies, besides their journals, publish, from time to time, translations or editions of oriental works,

Asp, dsp (Lat. aspis), a name confined by naturalists to the Vipera aspis, a vonomous snake, peculiar to the European Alps, but commonly applied to several species of poisonous serpents. The asp is often mentioned by both Greek and Roman writers; but the most common and celebrated would seem to be that called by the Arabs Haje Nascher. This animal measures from three to five feet in length, is of a dark green colour, marked obliquely with bands of brown. The haje is marked obliquely with bands of brown.

closely allied to lo, or spectacled snake of India. Forskoel, a Swedish naturalist, who has written on the animals of Egypt, tells us that the jugglers of Grand Cairo have the art of taming the haje, taking care, however, to de-prive it of its poisoned fangs, though even then they avoid its bite when irritated. The habit which this scrpent has

of erecting itself when approached, made the ancient Egyptians imagine that it guarded the places it inhabited, and accordingly they have represented it on their temples sculptured on each side of a globe.

their tempies sculptured on each side of a globe,
ASPLARGUE, as-pār-ā-pus (probably from Gr. sparasso, I tear), in Bot., a gen. of plants belonging
to the nut. ord. Liliucea, the Lily family. The
species are herbacoous, or shrubby plants, growing
wild in the southern parts of Europe and in Africa.
A. officinalis, the common asparagus, has long been
cultivated for the sake of the young succulent shoots
called furice which form a much setterned to

called turios, which form a much esteemed article of food. In the wild state the shoots are slender and tough, but by cultivation they are obtender. The ancient Romans were well acquainted with this The ancient Romans were well acquainted with this delicate culinary vegetable; and Pliny mentions a variety which grew near Ravenna, producing shoots so large that three weighed upwards of a pound. It is now cultivated in all the temperate regions of the world, and to a very great extent near London, Paris, and Vienna. In no part of Europe is it grown to such of Europe is it grown to such perfection as in the market-gardens round London. The asparagus of Mortlake is par-

ARPARAGUS.

ticularly large and succulent, and has long been prized by epicures. On the continent, great pains are taken in preparing the soil for this plant, by forming exca-vations, and filling them with layers of turf, hones, wood-chirts spand, loam, and fresh manure; but though plantations on such beds last longer than those formed by English gardeners, they do not yield better shoots; and it gas justly be questioned whether they are equally profitelist to the cultivators. There are many local varieties of asparagus, but they may all be re-garded as slight modifications of two well-marked sorts, namely, the red-topped and the green-towned. In the ticularly large and succulent, and has long been prized namely, the red-topped and the green-topped. In the namely, the reactopped and his green-topped. In the histonen gardon asparagus is generally grown in beds four fact broad, and in rows a foot or eighteen inches apart, with the space of nine inches between every two plants in the rows. The plants are either raised seed where they are to remain, or raised on a seed bed the preceding year, and transplanted. The value of the crop depends on the soil being dry, sandy, well trenched, and powerfully manured. The trenches should be from two and a half to three feet deep. During the winter the beds are covered with dung or litter, to protect the shoots from the frost; in spring, this covering is raked off into the alleys and dug in, while the beds are stirred with a fork to admit the air, heat, and rain to the young shoots. Asparagus from seed may be cut the third year, is in perfection during the fifth, and will continue good for ten or twelve years. The season for cutting is from the middle of April to the middle of June. Asparagus is often forced, generally by placing the roots on dung or tan-beds, but sometimes by covering the beds with dung. The ear-liest crops are obtained by the first mode, but the roots are lost. The culinary proparations of asparagus are few, the delicate flavour being easily overpowered. It is best boiled alone, and served on toast with melted butter. It is sometimes introduced into soup, and into delicate made dishes. Asparagus-shoots contain a peculiar crystalline principle, to which the name asparagin has been given: this has a specific action on the urinary organs, and its properties have caused asparagus to he popularly employed as a lithic. In medicine, the shoots, roots, and flowering stems of A. officinalis are occasionally employed as diuretics. The roasted seeds have been used as a substitute for coffee. The young shoots of the species A. tenuifolius, A. acutifolius, and A. albus, are enten in the south of Europe. — Ref. for recipes, Mrs. Becton's Book of Household Munagement.

ABPARAGIN, as pār'a-jin, a crystalline body, pro-cured from the young shoots of the asparagus, from the roots of the marsh-mallow and liquomice, and from other plants of a similar nature. The juice is expressed and evaporated, and the brown impure crystals are redissolved and treated with animal charcoal. On

being recrystallized, the asparagin forms in perfect octahedra or rhombic prisms.

ASPARTIC ACID, üs-par-tik.—An acid obtained from asparagin. When an aqueous solution of asparagin is heated under pressure, aspartate of ammonia is formed, which, if heated with baryta, forms the aspartate of that earth: the baryta is then precipitated by sulphuric acid. On evaporation, the aspartic acid crystallizes in thin rectangular tables.

ASPEN. (See POPULUS.)

ASPEN. (DER FOYLUS.)
ASPENULA, its.perul-lä (diminutivo of Lat. asper, rough), in Bot., a gen. of plants belonging to the nat. ord. Galiaceae, the Madder family. The species A. odoruta, the woodruff, is one of the most fragrant plants found in our woods: it contains the natural perfume to mittal abounts have given the natural perfume found in our woods: it contains the natural periume to which obemists have given the name of coumaris. A. cynauchicha, another indigenous species, is commonly called Quinsy-wort, on account of its supposed value as a remedy in sore throat.

ASPHAIT, ASPHAITE, or ASPHAITUM, is fall (Gr. asphaltos), a bituminous substance, found in the tertiary strata in different parts of the earth, evidently produced forms and by the action of heat. It is much used as a

rrom coal by the action of heat. It is much used as a parement when mixed with certain proportions of lime, and, gravel, or pounded stone. It is insoluble in alcohol, but is readily dissolved by turpentine, with which it forms a cearse varnish. From being found on the shores of the Dead Sca, it was formerly called or the shores of the Dead Sca, it was formerly called "Jewe" pitch." The finer sort, dissolved in turpentine, as much used by artists; but is apt to crack under the least displacement, by law, amounts to an asportation or carrying away.

Ass. ass (Lat. asinus; Fr. dne, for asse; Ital. asino), (Equus asinus), an animal too well known, at least in a domestic state, to need description here.

It is found wild in the same parts of Asia as the horse, from coal by the action of heat. It is much used as a

influence of variable temperature. Asphalt pavement was first introduced into this country by Mr. Charlege, who obtained the asphalt from Seyssel, in the Jara Mountains. It has not succeeded in London, being a support to the more than the support of the support speadily worn out by the enormous traffic. Asphait, when distilled, gives rise to numerous products, one of which, the so-called parafin oil, has lately risen to great commercial importance. Coal-tar is artificial

asphalt. (See BITUMEN, PETROLEUM.)
ASPHALTIN, as-falt'-in, a black substance, dissolved out of asphalt by oil of turpentine, insoluble in alcohol.

and ether.

Asthodelus, üs'-fo-de-lus (Gr. a, not, sphalle, I supplant), in Bot., a gen. of plants belonging to the nat. ord. Liliacea, the Lily family. It includes several beautiful perennials, with fleshy finger-like roots and upright annual stems covered with long leaves. The yellow and white asphodels, A. Luteus and A. aibus, have long been cultivated in Britain as garden-flowers. Immense tracts of land in Apulia are covered with the letter spaces which affords are on purpolar party to the latter species, which affords good nourishment to the In ancient days it was sacred to Proservine.

and used in funeral devenumies.

ASPHYXIA, &-fx-i-d (Gr. a, not, and sphusis, pulsation), literally signifies cessation of pulsation, and is used in Med. to denote that state of body and is used in Med. to denote that state of body during life in which the pulsation of the heart and arteries cannot be perceived. In asphyxia, the action of the lungs is suspended, and the blood no longer undergoes that purifying process so necessary to life. Hence the body becomes allled with impure blood, the powers of sensation and voluntary motion are sus-pended, and, if the proper means of restoration are not resorted to, death will speedily ensue. Asphyxia may be produced by various causes; as by whatever prevents the necess of air to the lungs, as strangulation, drowning, choking, &c.; or whatever interferes with the action of the nerves that are concerned in respiration, as paralysis, cold, stroke of lightning, &c. It may also be produced by breathing an impure or a too rarified atmosphere. (See Drowning, Strangulation, Suffocation, &c.)

ASTIDIUM, as-pid'-i-um (Gr. aspidion, a little buckler), in Bot., a gen. of ferns (which see). The fronds of the species A. fragrans possess aromatic and slightly bitter properties, and have been used as a substitute for tea.

ASPIDURA, ils.-pi-du'-ra (Gr. aspis, shield, oura, tail), in Geol., a gen. of fossil star-fishes, so named from the buckler-like arrangement of the bony plates which protect the arms. They are peculiar to the muschelkulk of Germany, and are closely related to the exist-

Asprants, de'-pi-rait (Lat. spiritus asper, harsh breathing), in the Gr. Gram., is a name given to a certain mark or accent (thus ') placed over the initial vowel of certain words to indicate that it is to be pronounced roughly or harshly, as if preceded by an &. All words beginning with a vowel have either a rough or soft breathing,—the spiritus asper or the spiritus lenis (thus'), because a word beginning with a vowel can only be distinguished in the pronunciation from the preceding word by in some measure drawing the breath. Certain consonants are likewise called aspi-

breath. Certain consonants are likewise called appirates, from the harsh breathing entering into their pronunciation: these are  $\phi$ ,  $\chi$ ,  $\theta$  (phi, chi, theta).

Asplenium, as -ple'-ni-um (Gr. a, not, splen, spleen), in Bot, a gen. of ferns, included in the sub-ord. Polypodiese. Many species are common in Great Britain, being known as spleen-worts. They were formerly used in medicine, but have now fallen into disuse. A. Ruta-muraria is popularly known as wall-rue. A. Trichomanes is an elegant little forn, common nocks and old walls. it is often utilizated in cases on rocks and old walls: it is often cultivated in cases and on garden rockwork.

ASPORTATION, ds-por-tai'-shon (Lat. ad, to, and porto, I carry), in Law, is the carrying away of goods. Thus, in all felonies, there must not only be a taking, but a carrying away: cepit et asportavit was the old law Latin. But the least displacement, by law, amounts to an exercisting or asswring away:

and it is here that we find it make the best figure in a state of domestication. In these countries it would seem that the ass was tamed before the horse; and to this day, in the East, asses are far more generally used as beasts of burden and draught than horses. There, howsver, instead of being despised and neglected, cars is taken to cultivate the breed, by crossing the finest specimens. Even the wild as is procured for this purpose. "The asses of Arabia," says Chardin, "are, perhaps, the handsomest animals in the world. Their coat is smooth and clean: they carry the head and it is here that we find it make the best figure in are, perhaps, the handsomest animals in the world. Their coat is smooth and clean; they carry the head clevated, and have fine and well-formed legs, which they throw out gracefully in walking or running. They are used only for the saddle, and are imported in vast numbers into Persis, where they are frequently sold for 400 livres, and, being taught a kind of easy ambling pace, are richly caparisoned, and used only by the rich and luxurious nobles." The ass is, properly speaking, a mountain animal. Its hoofs are long, and turnished with an extremely hard rim, leaving a hollow in the centre, by which means he is enabled to tread with more security on the slipperty sides of hills and craggy places. Its most general colour is mouse-colour, with a blackish stripe strending along the spine to the tail, and crossed by a similar stripe over the shoulders. tail, and crossed by a similar stripe over the shoulders. The female goes with young eleven months, and seldom produces more than one foal at a time.

ASSAFETIDA. (See ASAFETIDA)
ASSAI. (See EUTEFFE.)
ASSAIS INATION, "is-sais-is-nai-shon (Etymol. uncertain), is strictly the murdering a person for hire. The term is also applied to killing by treachery or sudden

Assassins, as-sas'-sins, those who kill, by treachery and violence, persons unprepared for defence. The word assassin is said to have originated from a certain prince of the family of Arsacidæ, popularly called Assassins, who lived in a castle between Antioch and Damascus, and trained, in blind obedience to his communds, a number of young men, whom he employed in murdering the princes with whom he was at emity. According to Colonel Chesney, the Assassins, or Ismail, still hold their chief seat at Kulat-el-Masryad, in Persia, and have several strongholds in the mountains of Tripoli. They are called Assassins from their immoderate use of haschischah (henbane), which produces an excitement amounting to fury. The first chief and law-maker of this singular tribe was Hassan Ben Sabah, to whom the Orientals gave the name of Sheikh-el-Jebelz, but who was better known in Europe as the Old Man of the Mountain, a wily impostor, who made funatical and implicit alaves of his subjects, by imbuing them with a religion compounded of that of the Christians, the Jews, the Magi, and the Mahometans. The principal article of their belief was that the Holy The principal article of their belief was that the Holy Ghost was embodied in their chief, and that his orders proceeded from the Deity, and were declarations of the Divine will. They believed assassination meritorious when sanctioned by his command, and courted danger and death in the execution of his orders. In the time of the Crusades, they mustered to the number of 50,000. So great was the power of the sheikh, or chief, that the averagins of every quarter of the close of 50,000. So great was the power of the sheath, or chief, that the sovereigns of every quarter of the globe secretly paid him a pension; and Philip-Augustus, king of France, understanding that the sheikh had ordered his assassination, instituted a new body-guard, distinguished for their courage and activity, called sergens d'armes, who were armed with bows and arrows and brass clubs; and be himself noter ventured in public without a club loaded with gold or iron. The Knights-Templars alone dared bid deflance to this terrible and subtle foe. Among the victims of their daggers was Courad, marquis of Montferrat, who was regulared in the market place at Twee in 1102 al. daggers was Corrad, marquis of Montferrat, who was murdered in the market-place at Tyre, in 1192, although some historians have attributed the crime to Richard I. For a long time this fearful sect reigned in Persia and on Mount Lebanon. Holagoo, or Hulaku, a Mogul Tartar, in 1254, dispossessed them of several of their strongholds; but it was not till some years after that they were completely extirpated by the Egyptian forces sent against them by the great suitan Bibars.

to another, whether from malice or wantonness; as by to another, whether from malice or wantonness; as by striking at him with or without a weapon, though the party striking him misses his aim. So, drawing a sword; throwing a missile with intent to wound or estrike; presenting, agun at a person within the distance to which it will carry, or pointing a pitchfork at a person standing within reach; holding up one's fist at him in a threatening or insalting manner; or with such other circumstances as denote, at the time, an intention (coupled with a present ability) of using actual/foleace against his person. There are many other acts which will in law amount to an assault: but they are too will, in law, amount to an assault; but they are too numerous to be inserted in a work of this nature. For an assault, an action for damages will lie, or the aggressor may be indicted at the quarter sessions, or proceeded against by summons or warrant of justices of the peace.

Assault, in Mil. Language, is a sudden and general; attack made by a besieging army to obtain possession

of a fortified post.

Assavine, as-sai'-ing (Fr. essayer, to try), a quanti-tative analysis performed for the sake of discovering the amount of one particular constituent in a compound The term is generally applied to the determination of gold or silver in alloys of these metals; but it is also used to denote any process for determining the commercial value of any substance by the separation of its valuable portion. Thus lichens and indigo are assayed for their colouring matter, galls and oak bark for their tannin, and ores for their metal. The assaying of gold and silver is generally performed by the process of cupelling. Bone-ash is mixed with water, made into a little cup and dried. This is called the careful and has the cup, and dried. This is called the cupel, and has the property of absorbing oxides when they are combined with oxide of lead in a state of fusion. Silver is assayed by mixing it with a certain quantity of lead, determined by the amount of impurity suspected to exist in the alloy. The mixture is melted in the capel in a current of air, until the whole of the lead is converted into oxide, which dissolves the other impurities, and carries them down with it into the cupel, the silver being left behind in a pure state. Silver alloys are also assayed by dissolving them in nitrie acid, and precipitating the silver in the form of chloride by a standard solution of chloride of sodium. This method is now adopted in the English, French, and Belgian mints, as well as in those of the United States. Gold is generally assayed by the process of quartation. It is mixed with three times its weight of silver, and nine times its weight of lead, and expelled as described above. The whole of the impurities are thus got rid of, and an alloy of silver and gold remains. This is above. The whole of the impurities are thus got rid of, and an alloy of silver and gold remains. This is beaten into thir plates, which are thrown into nitric acid, which dissolves out the silver and leaves the gold untouched. The large amount of silver is added to prevent any particles of that metal existing in the gold from being protected by it from the action of the acid, and remaining undissolved. For the assaying of the other metals,—Ref. Percy's Metallurgy.

Assembly, ds.sem'ble, is a term formed from the French assemble, which signifies literally the meeting together of a number of persons in one place for the

together of a number of persons in one place for the same object or design. In a more limited sense, it is applied to important meetings of a political or eccla-siastical nature. These have usually other names, under which the more important of them will be found noticed; as, councils, convocations, synods, comitia,

ASSEMBLY, NATIONAL, was the name assumed, on 17th June, 1789, by the commons, who formed the third estate of the general assembly convoked by Louis XVI. of France on 5th May, 1789. They constituted themselves a national assembly, to which the destroy of the problem and cleave afterwards adhered. deputies of the nobles and clergy afterwards adhered mardered in the market-place at Tyre, in 1192, although some historians have attributed the crime to Richard I. For a long time this fearful sect reigned and framed a constitution, whence they are also termed the Constituent Assembly. They dissolved on the action Persia and on Mount Lebanon. Holagoo, or Huckey and the Mogul Tartar, in 1264, disposessed them of several of their strongholds; but it was not till some several of their strongholds; but it was not till some years after that they were completely extirpated by the Egyptian forces sent against them by the great Assayirs, as-sold (Lat. assultus, from Fr. assailer, and the seminatof regal power, which ended in the overtone sessant, assail, fall upon), in Law, is an attempt or offer, with force and violence, to do a corporal hurt

# Assembly of Divines

September 21st, 1792, having first summoned a national convention, which met on the same day. This last was invested with sovereign power to decide the fate of the mongrehy, and to introduce a new form of gogernment. ASERMELY OF DIVINES, WESTMINSTER, was an assembly of 121 olergymen and thirty laymen, distinguished for learning and piety, summoned by an ordinance of parliament in 1632 to meet at Westminster. If or settling the government and literary of the settling t ster, "for settling the government and liturgy of the Church of England, and for vindicating and clearing the said church from false expersions and interpreta-tions, to There were also four clerical and two lay representatives from the Church of Scotland. The representatives from the Church of Scotland. The first-meeting of the Assembly took place on the 1st July, 1643, and the last on 22nd February, 1649, during which they had met 1,163 times. The chief ruits of their lubours were.—1. An humble advice to parliament for ordination of ministers and settling the presbyte-rian government; 2. a directory for public worship; 3. a confession of faith; 4. a larger and shorter cate chiam; 5. a review of some of the Thirty-nine Articles.

Among the more distinguished members of this assembly were Usher, Saunderson, Lightfoot, Selden, Gataker, Greenhill, Arrowsnith, Reynolds, Calamy, and Twiss. The four Scotch divines were Henderson, Gillespie, Rutherford, and Baillie.

"Assimply, THE GENERAL of the Church of Scotland, is the highest ecclesiastical court of Scotland, which meets annually at Edinburgh in the month of May, and sits for about ten days. It consists of representatives, clerical and lay, from the several presbyteries of the adultable of the several presbyteries of the church, and a few other members. Its delibera-tions are presided over by a moderator, elected annually; and there is also present at its sittings a royal commissioner, representing the crown, but who takes no part in its proceedings. It forms the court of takes no part in its proceedings. It forms the court of appeal from the presbyteries and synods. Since the disruption in 1843, the Free Church of Scotland has also its general assembly, which likewise meets annually at Edinburgh in May, and otherwise resembles the other, except that it has no royal representative.

Assubly, Unlawful (Fr. assembler, to flock together). An unlawful assembly is the meeting of three or more persons to do an unlawful act, whether they do it or not.

ASSINT, as-sent' (Lat. ad, to, and sentio, I think), in Phil., is that act of the mind by which we accept something as true. It is the work, not of the understanding, but of the reason; and is free, when it is not the unavoidable result of evidence; necessary, when the withholding of it involves a contradiction.

Assent, Royal, Tark by which bills that have passed the Houses of Parliament become law, and without which they are null, constitutes one of the highest prerogatives of the crown. It is no mere form, but a prerogatives of the crown. It is no mere form, but a bond fide exercise of legislative functions, though there has not for many years been an instance of its being withheld: the last is said to have been in the reign of Queen Anne. The royal assent may be given by the sovereign in person, robed, crowned, and seated on the throne in the House of Peers, with the Commons standing at the bar, or by commissioners appointed for that special purpose, and for that single occasion. Of late years, except in the case of bills augmenting the royal income, the practice has been to give the royal assent by commission; but, in the former case, the sovereign usually prefers a personal manifestation of thanks. The commissioners are usually three or four of the great officers of state. The royal assent to each bill is amounced by the clerk of parliament in Norman-French. Having read the title, he says, if it is a bill of supply,—Le roi (or la reine) remercie ses loyal subjects, accepte leur bénévolence, et ainsi le seute; if any other public bill,—Le roi le seut ; and if a private bill,—Soit fuit comme il est desiré. Should the sovereign bill,—Soit fatt comme u est acesre. Snould the sovereign refuse assent, it is in the form of Le roi (or la reine) s'atricera. In the case of acts of grace or amnesty which originate with the crown, and which are signed by the sovereign before being laid before parliament, and are only read once in each house, the clerk administration of the partial through a follows: dresses the throne as follows: Les Prélats, Seigneurs, et Commons en ce present Parliament assemblés, au nom de tout vous autres subjects remercient très humblemen votre Majeste, et prient à Dieu vous donner en sante conne vie et longue.

## \*Assignes

Assurrow, as-ser'shon (Lat. 1d, to, and sero, I join), is a term employed in Logic to denote the affirmation or denial of something.

Assessed Taxes, de-seed, are certain taxes raised upon houses, servants, horses, carriages, dogs, ac, under various acts of parliament. The date of their first introduction has been variously stated, and their nature and amount have varied according to the exi-

Assers, in matters of law, string by him on the cench.

Assers, &-sets (Fr. assez, enough), in Law, are either real or personal. Where a man has lands in fee-simple, and dies seized thereof, the lands which come to his heir are assets real; and where he dies possessed of any personal estate, the goods which come to his executor or administrator are assets personal. Assets are also divided into assets per descent and assets inter maines. 1. Assets by descent are lands which descend to the heir of a person dying seized thereof, and owing specialty or simple-contract debts. In that case, the estate is considered as assets to be administered in a court of equity for payment of the debts, the specialty debts having preference. 2. Assets inter maines are where a man indebted makes executors, and leaves them sufficient to pay his debts and legacies; or where some commodity or profit arises to them in right of the testator, which are called assets in their hands. This term is also applied com-mercially to any available property for the payment

of a man's debts.

Assignto, "is'-se-en'-to (Span., treaty), is a term specially applied to a treaty between the Spanish government and some other nation, by which the former, in consideration of certain payments, grants the latter a monopoly of supplying the Spanish colonies in America with negro slaves from Africa. As early as the reign of Charles I. of Spain, a treaty of this kind was concluded with the Flemings. Similar compacts were entered into with the Genoese (1580), Portuguese (1696), and with the French Guinea Company (1702), which then took the name of the Assiento Company. In 1713 the celebrated Assiento treaty with in was concluded at Utrecht, and was made over by the government, for thirty years, to the South-Sea Company. One of the conditions of this treaty was, that the company had a right to send yearly to these Spanish colonies a vessel of 500 tons, laden with all sorts of merchandise. The misunderstandings that arose out of this led to a war between the two countries in 1739. At the peace of Aix-la-Chapelle, in 1748, the company had their rights for the remaining four years quaranteed to them; but they relinquished them at the convention of Madrid, in 1750, in consideration of a sum of £100.000.

Assignat, as seen-ya (Lat. assignatus, assigned), the name of the paper currency issued by decree of the National Assembly of France, with the approbathe ABROMAI ASSEMBLY OF FRANCE, with the approperium of the king, April 1, 1799, and so called from the national property being assigned as security. Atfirst, 400,000,000 francs were issued; but, a few months later, 800,000,000 more were issued, and subsequent issues increased the number to about 45,000,000,000 francs.

increased the number to about 45,000,000,000 francs. The consequence was that they became of almost no value, and at length, in 1796, they were withdrawn from the currency.

Assigner, de-si-ne' (Lat. assignatus, from assigno, ad and signo, I mark or sign), one who is assigned or appointed by another to do any act or perform any business. It also signifies one who takes any right, title, or interest in property. by an assignment from title, or interest in property, by an assignment from an assignor, or by act of the law. Assignees are by deed or in law. An assignee by deed is when a lessee deed or in taw. An assignee by deed is when a lessed of a term, og the owner of personal property, sells or assigns the same to snother; that other is his assignee by deed. Assignee in law is he upon whom, by law, the property devolves, without any appointment of the person; thus, an executor is assignee in law to the testator; and the persons upon whom the title to

145 3 30 de 15

### Assignee of a Bankrupt

and disposal of a bankrupt's estate devolves, is an assignce in law of the bankrupt, by virtue of the statute which vests the property in him on his appointment

Assigned of A BANKRUPT. In order to convert the estate of a bankrupt into money for division amongst the creditors, an assignee or assignees are spointed. In the first instance, an official assignee is appointed by hallot by an officer of the Court of Bankruptcy, who, immediately on the adjudication of bankruptcy, takes possession of the estate, and retains possession of it until the appointment of a creditors' assignee. The creditors' assignee is chosen at the first meeting of the creditors assomes is enosen at the mrss meeting or one creditors under the bankruptery or an adjournment thereof, by a majority in value of the creditors who have proved their debts; and, upon his appointment, all the estate of the bankrupt, both real and personal, is divested out of the official assignee and vested in him. The powers and duties of such assignees are regulated by "the Bankruptcy Act, 1861."

Assignment, de-sine-ment (Lat. assignatio), in Law, is the transferring and setting over to another of some

right, title, or interest.

ASSIMILATION, &-sim-i-lai'-shon (Lat. adsimilatio, from ad, to, and similis, like), the act of organized bodies, by which they convert foreign substances into their own proper substance, by which food is converted

their own proper sanstance, by which their own into nutriment. (See NUTRITION.)

Assizs, distinc' (Lat. assessio; Fr. assis, part. past from the verb assoir, to sit).—The term, in its present acceptance, implies a court, place, or time when and where the writs and processes, whether civil or criminal, are decided by judge and jury. The counties, for the purpose of holding the assizes, are divided into eight circuits, and judges are assigned by commission to hold their assizes twice a year in every county, except London and Middlesex. The judges sit by virtue of four several authorities. 1. The commission of the peace.

2. A commission of oyer and terminer, directed to the judges and gentlemen in the county, by which they are empowered to hear and determine treasons, felonies, and misdemeanours, by whomsoever committed.
3. A commission of general good delivery, directed to
the judges and clerk of the assize associate, to try every prisoner in the gaol committed for any offence what soever; but none but prosoners in gaol, and to discharge such against whom no bill is preferred or found. 4. A commission, or writ of nies prius, which is a consequence of the ancient commission of assize being annexed to the office of justices of assize, by the Statute of Westmir ster, the second, 13 Edw. I. c. 30, by which the judges are empowered to try all questions of fact issuing out of the courts at Westminster that are ract issuing out of the courts at westminster that are then ripe for trial by jury, and in which the venue is laid in the county. These commissions are accom-panied by writs of association, by which certain persons are directed to associate themselves with the justices and serjeants, that a sufficient supply of commissioners may not be wanting. But, to prevent the delay of justice by the absence of any of them, there is also issued a writ of si non omnes, directing that, if all cannot be present, any two of them (a justice or serjeant being one) may proceed to execute the commis-sion. In law the assizes are but as one day, and the entry of every proceeding at them refers to the area day of assize.

ASSOCIATION, de-so'-si-ai'-shon (Lat. ad, to, and socius, a companion), is a union of persons or a society formed for mutual assistance, or for the joint carrying out of some definite object. The value of combined effort in carrying out objects where individual exertions would utterly fail, is very manifest. Many undertakings, in which it would be impossible for individuals to embark, we see carried on with success around us by means of associations. More particularly is the term applied to a union of individuals for the accomplishment of great social, political, or scientific objects.
Association is one great feature of civilization, and is ons of the most marked characteristics of the present age. "Men have learned," says Dr. Channing, "what wonders can be accomplished in certain cases by wonders can be accomplished in Certain cases by union, and seem to think that union is competent to mything. You can scarcely name an object for which come institution has not been formed. Would men spread one set of opinions and crush another,-they

## Association of Ideas

make a society. Would they improve the penal code or relieve poor debtors,—they make societies. Would they encourage agriculture, or manufactures, or scines,— they make societies. Would one class encourage ey make societies. —they make societies. Would one class encourage horseracing and another discourage travelling on a Sunday,—they make societies." But, while combinations may be mighty engines for good, they also may be made great engines for evil; as, where they attempt to put down opinions, whether true or false, by mere force of numbers, and thus interfere with or subvertible that freedom of thought on which all truth depends. (For associations for the nursous of controlling the (For associations for the purpose of controlling the rate of profits or of labour, see COMBINATIONS.) Associations, too, are often injurious in interfering with free thought and action among the individual members; as, in order to joint co-operation, it is necessary for each to abandon a portion of his own individual views and adopt those of the majority of his co-associates. They are for the most part passive bodies, guided solely by the will and management of a few individuals among them.

ASSOCIATION. AFRICAN. (See AFRICAN ASSOCIA-

TION.)

ASSOCIATION OF IDEAS, in Mental Phil., is the name given to that principle of the human mind by which certain ideas,certain ideas,—thoughts, feelings, or emotions, become connected together in such a way, as that they afterconnected together in such a way, as that they are wards tend to recall or reproduce one another. A good illustration of this is given by Coleridge, in his Biographia Literaria. "Seeing," says he, "a mackerel, it may happen that I immediately think of gooseherries, because I, at one time, ate mackerel, with gooseberries as the sauce; the first syllable of the latter word being that which had co-existed with the image of the bird so called, I may then think of a goose. In the next mo-ment, the image of a swan may rise before me, though I had never seen the two birds together. In the first two instances, I am conscious that their co-existence in time was the circumstance that enabled me to recollect them; and equally conscious am I, that the latter was recalled by me, by the joint operation of likeness and contrast. So it is with cause and effect; so, too, with order." Various philosophers have attempted to define these laws of mental association. According to Aristotle, they are three,—resemblance, contrast, and contiguity. Hume, who has generally been followed by modern philosophers, makes them resemblance, contiguity, and causation. Some have endeavoured. again, to reduce all the phenomena of association to one great law. The first attempt of this kind was made by Augustine, who said that thoughts that had once co-existed is the mind, are afterwards associated toge-ther. Sir William Hamilton states, that all the laws of association may easily be reduced to two, --simultaneity, and resemblance or affinity; under the former, including thoughts that are in the mind together, or in immediate succession; under the latter, all that have such a connection existing between them as that the thought of the one involves the thought of the other. These two he then reduces to one, which he calls the law of redintegration, or totality, including, in the first place, those thoughts which arose at the same time, or in immediate consecution, and in the second, those thoughts which are bound up into one by their mutual affinity. "Thoughts or mental activities having once formed parts of the same total thought or mental activity, tend, ever after, immediately to suggest each other." It seems evident that all the phenomena of mental association may be reduced to one great law,—that of contiguity, by which ideas that have been in the mind together, or in close succession, ever after manifest a tendency to recall or reproduce each other. In persons of lew ideas—the unsaturated or ignorant—this principle is very marked; Shakespeare's Mrs. Quickly is an admirable instance of this, as she narrates with a naming ninuteness the various incidents that bappened at the time when Sir John Falstaff made her a promise of nurriage. When, however, the mind has become possessed of a number of ideas, those that have been frequently before it become associated in various ways with numerous other ideas; and here we observe a law of mind analogous to the law of attraction in matter, by which an idea, instead of recalling all the ideas with which it may have been associated, which would result in endless confusion, selects only certain

146

That some, rather than others, are selected, of them. of them. That some, rather than others, are selected, depends upon a variety of circumstances; as, the frame of mind of the individual at the time, their recentness, or the frequency or length of time they may have been associated together. Another principle of association is that of a part suggesting a whole, or a whole one or more of its parts. Most of our ideas are made up of a number of others, any one of which may suggest the whole idea, or the whole idea may suggest one or more of them. Then paper may suggest whiteness or smoothof them. Thus, peper may suggest whiteness or smoothness, or any of these may suggest paper. In like manner, a word may be resolved into its component parts ner, a word may be resolved into its component parts or syllables, any one of which may suggest other words of which it forms a part. In this way, one word suggests another word having the same primal orderminal syllables, and hence the rhythmical terminations of the lines in poetry make it much more easily remembered than prose; and the alliteration so frequent in proverbs renders them casy to be recalled. It seems that by this principle of mental analysis the law of similarity or resomblance may be activated, the mind as it were similarity may be a this index the mind as it were semblance may be explained; the mind, as it were, separating an idea into its component parts, till it obtains one feature which exactly corresponds to a feature that goes to make up another idea. One idea may suggest another idea with which it had never previously been associated: this is done by means of a third idea common to both. Thus, Hannibal may suggest Napoleon, though they may have never been as sociated together in the mind, from their having both crossed the Alps under similar circumstances. intermediate idea is here evident; but frequently it is not perceived, though in every case its influence may be traced. To this same principle, we think, may be referred contrast, or that tendency of the mind to be referred contrast, or that tendency of the mind to proceed from one idea to its contrary; as, from virtue to vice, from light to darkness, from riches to poverty; there being, in every such case, an intermediate idea common to both, of which the one denotes an abundance, the other a deficiency. It is upon the association of ideas that memory depends. (See Mirmoux.) ASSONANCE, 28'-80-mince (Lat. ad., to, and sono, I sound), is a term used in Poetry and Rhet, to denote that the words of a phrase or verse have the same sound

that the words of a phrase or verse have the same sound or termination, yet without making proper rhyme. This is commonly a fault in English, but the Romans sometimes used it with elegance; as \_\_'' Militem com-paravit, exercitum ornavit, sciem lustravit."

ASSONANT RHYMES, "is-so-nant (Lat. ad, to, sono, I sound), is a term applied to a kind of verse common among the Spaniards and Portuguese, where the vowels

only are required to rhyme.

Assumption, iis-num's shon (Lat. ad, to, and sumptus, taken), is the name of a festival celebrated by the Homan Catholic and Greek churches on the 15th of August, in honour of the miraculous ascent of the Virgin Mary into heaven.

ASSUMPTION, in Logic, is the name given to the minor or second proposition in a categorical syllogism. It is sometimes also applied to the consequence drawn from the propositions of which an argument is com-posed. Thus we say the premises are true, but the assumption is captious.

ASSURANCE, LIFE. (See INSURANCE.)

Assuran Architecture, as-air-i-an.—It is impossible to give any detailed account of the style of architecture adopted by the Assyrians; but from the architecture acopted by the Assyrians; but from the important discoveries made by Botta at Khorsabad, and Layard at Kouyunjik, we are enabled to form some idea of the general features that characterized the buildings they raised as temples for their gods and palaces for their kings. It appears that when a site for any structure of great size and importance had been determined on, the first thing that was done was to raise an enormous mound, several acres in super-ficial extent, and from twenty to forty feet in height: they did this to obtain an imposing elevation for their buildings. The country through which the Tigris and Euphrates take their course is perfectly flat, and their Empirates take their course is periectly flat, and their palaces, which seem to have been low in proportion to their length and the extent of ground they covered, would have appeared dwarfed in height, and comparatively insignificant, if they had been raised on the lard of the soil itself. These satisficial platforms were not merely heaps of earth, but were systematically constructed of sun-dried bricks, with an outer facing of sive structures than the soil of the country mixed with

hard calcareous stone, brought from the distant mountains, and out in regular blocks. The dimensions of the mound of Khorsabad, which is supposed to have formed the north angle of the city of Ninevels, may be given here to show the immense extent of these constructions, and the labour and time which must bave been expended in piling them together it was formed of two rectangles, in the shape of the letter T, that which is represented by the transverse part being 975 feet long and 442 feet broad, rising 20 feet above the level of the plain; while the other, on which the palace stood, was 650 feet long and 553 feet deep, being 10 feet above theseurisce of the lower platform. The superficial area of the two rectangles was nearly 18 zores. Botta states the height to have been from 40 to 50 feet. The mound at Konyunik was 7,800 feet in circumference, and its area more than four times as large as that of Khorasbad. Access to these terraces was gained by flights of broad must have been expended in piling them together Access to these terraces was gained by flights of broad low steps adorned with sculptured figures; and the low steps adorned with sculptured ngures; and the platforms themselves were undoubtedly gardens, like the famous hanging gardens of Babylon, built by Nebuchsdnezzar for his wife Amytis, which rose one above another on terraces supported by piers and arches, until they equalled the height of the outer walls of the city. The buildings raised on these mounds of the city. The buildings raised on these mounds were quadrangular in form, with portals in each facade, flanked with soulptured winged bulls of great size. The walls were of brick faced with panels or slabs of gypsum, adorned with figures in bas-relief larger than life. The pavement of the apartments consisted of sun-dried or kilu-baked bricks, but the consisted of sun-dried or kiln-baked bricks, but the principal passages were floored with broad flags of stone. The state rooms in these palaces were of great size, many in the palace of Khorsabad being about 118 feet long, and from 22 to 33 feet in breadth; while at Kouyunjik, an apartment was discovered which was 200 feet long and 45 feet broad. The walls of Assyrian cities were of enormous thickness, being, in some cases, 45 feet in width; they were lofty, and were surmounted by square towers at intervals, with battlements for the protection of the archers who were engaged in defonding any beleaguered town. The walls of their palaces were also of great width, being as much as 16, 18, and even 21 feet in breadth; galleries are supposed to have been gonstructed on the top of are supposed to have been constructed on the top of these broad walls by raising rows of dwarf columns on these broad walls by raising rows of dwarf columns on the inner and outer edge, and adding a flat terraceroof plastered on the upper surface. There are no windows in any of the palaces that have yet been discovered, and it is conjectured that they must have been lighted by apertures in the roof, which must have been flat, and formed of horizontal beams supported on rows of columns placed at intervals in the rooms below: a flooring, or rather ceiling, of word was afterbelow: a flooring, or rather ceiling, of wood was after-wards added, and covered with layers of sun-dried bricks. The openings in the roof would probably be surrounded by open parapets, or rows of columns sur-mounted by a similar kind of rooting. Such a method of construction would afford protection from the rain as well as sufficient light and good ventilation; and the strong glare of the summer sun could be moderated by the use of curtains. The immense thickness of the walls would render the rooms cool in summer and warm in winter. It must be remembered that the above description of the method used for roofing these buildings is, to a great extent, hypothetical; but all the Assyrian palaces that have been explored bear traces of having been destroyed by fire; and this could not have been the case unless a considerable quantity of wood had been used in their construction in the manner above indicated. Layers of bitumen were spread between the earth and the bricks and stones which composed the pavement, and also placed behind the alabaster slabs with which the walls were coated, to prevent injury arising from damp. Semicircular-headed openings in buildings represented on some of the bas-reliefs show that the Assyrians were acquainted

chopped straw and hardened by exposure to the sun. All is life and animation in every part of their build-ings; not a plain unsculptured slab is to be seen. They introduced rich colouring into their decorations; and from the fragments found on the floors, and among the heaps of rubbish that fill the rooms, it appears that the brick walls above the carved slabs were faced with enamelled tiles of the richest hues, and that these alabaster panels were set in a brilliant bordering of figures and arabesque patterns common to Eastern architecture. This colouring was most probably carried through the enrichments of the ceilings and the wooden columns that supported them. No stone columns have hitherto been discovered in any of the palaces that have been mentioned above, and they do not seem to have been introduced into Assyrian architecture of the age to which the cities of Nineveh and Babylon belong. Simple in conception and design, massive in construction, and elaborate in ornamenta-tion, the architecture of the Assyrians derived its chief grandeur and imposing appearance of stability and power from the broad base and lofty piles of successive terraces on which their public buildings were always eracted.—Ref. Bonomi's Nineseh and its Palaces.

Assyrian Sculpture.—Although the architecture

of the Assyrians was simple enough, yet this people reached a high pitch in the excessive richness of their sculpture. They seldom made statues or representations of the human form or animals in a complete and per-fect state, but confined themselves to sculpture in basrelief, embossing figures on the surface of the slabs of marmoriform gypsum, with which the sides of their rooms and passages were coated. These bas-reliefs were intended to be pictorial representations of the manners and customs of the people, and, more par-ticularly, of the history of the nation, giving an account of the remarkable events in the reign of any monarch, very much in the style of the Bayeux tapestry, allow ance being made for the difference of material. Or some of these gypsum panels, which are about nine feet high and from three to nine feet broad, carefully joined to present a continuous surface round the walls of any room or passage, some royal personage is represented, attired in richly-ornamented robes, with a tiars on his head, surrounded with a numerous retinue of priests, warriors, eunuchs, and attendants; on others, the attack and defence of a fortified city is depicted, the pursuit of a flying foe, the torture and death of captives, pursuit of a flying foe, the torture and death of captives, and all the varied episodes of war; while banquets, the chase, lion and bull huuts, and the arts of peace, form subjects with which those already mentioned are occasionally interchanged. On some, the cagle-headed figure of Nisroch, and those of other Assyrian deities appear. Some of these are represented with four wings, and accompanied by what is termed the sacred tree; the priests are generally represented with the symbolic flower, apparently taken from this tree, in one hand. The jambs of the portals of their palaces and chambers were assully carried into the figures of winead bulls. were usually carved into the figures of winged bulls and lions with human heads; the head, fore-legs and fore part of the body as far as the shoulders being enside of the block which formed the jamb. One great peculiarity about these figures is, that they are repeculiarity about these figures is, that they are re-presented with firelegs, that they may appear complete, whether viewed in front or at the side. A figure of a man fifteen feet in height was found between bulls of this sort flanking the portals of the palace of Khorsabad; it was strangling a lion apparently in mortal agony, and was supposed to represent "the mighty hunter" Nimrod himself. Representations similar to the figure m the annexed engraving are frequently found on the bas-reliefs at Nimroud and Khorsabad: that from bas-reliefs at Nimroud and Khorsabad: that from which the engraving was copied was found at the latter place, the only perfect figure remaining in the court in which it was discovered. Bonomi imagines it to be "a diviner or magician, one of the four orders of Chaldeans mentioned in Daniel (ii. 2), of whom it was the custom for the kings of Assyris to require the interpretation of dreams." The figure seems to be that of a priest, with the hair and heard carefully dressed, and the head bound with a fillet or circlet, with resettes in front and at the sides. It carries the symbolic flower in its left hand, while in the right it bears a wild he goat or ibex, similar in form to those which are found in the

mountains that surround Mesopotamia. The long flowing robe is adorned with deep fringes and orna-mented borders, and the short tunio which appears below

it is trimmed in a similar man-ner. Bonomi expresses his belief that these Chaldeans and priests were the sculptors and painters of the time. All the specimens of Assyrian sculp-ture that have been found show that they were faithful observ-ers of nature, although they were not sufficiently good draughtsmen to accomplish faithfol reproductions of all they saw around them. The predominance of representations of battles and victories, and crueltics practised to-wards their pri-soners taken in

ASSYRIAN SCULPTURE.

war, furnishes ample proof that they were a proud and imperious people, valuelorious, and boastful, as, indeed, we learn in Holy Scripture; and this is supported by the arrogant character of the cunciorm

ported by the arrogant character of the cunciform inscriptions accompanying their sculptures, which have been deciphered by the skill and ingenuity of Grotefend, Rawlinson, and others versed in oriental languages and literature.—Ref. Bonomi's Ninecch and its Palaces; Buried City of the East.

ASTER, ds'-ter (Gr., a star), in Bot., a gen. of plants belonging to the nat. ord. Compositæ, and containing a great number of species, growing in all parts of the world. One species only, A. Tripolium, the seaterwort, is a native of Britain. Some of the asters are favourite garden-flowers; namely, the New England aster (A. Nova Anglia), the Michaelmas daisy (A. Tradescardi), and the China aster (A. chinensis). The last is the most valued, and is one of the most showy annuals in cultivation. It was brought from China in the early part of the 18th century, and an immense last is the frost variety, and an immense number of varieties, exhibiting great diversities of form number of varieties, exhibiting great diversities of form and colour, have been developed by British and conti-nental florists. The genus Aster has lately been split into six or seven distinct genera, which together form the tribe Asteroida.

ASTERACEE, äs-ter-ai'-se-e, the name given by some botanists to the Composite order of plants. (See COMPOSITE.)

COMPOSITE.)

ASTREISK, de'-ter-isk (Gr. aster, a star), is a mark in the form of a small star (\*), placed over a word or sentence to refer the reader to the margin, or elsewhere, for an explanation, quotation, or the like.

ASTRISM, de'-ter-ism (Gr. aster, a star), a group of stars, a term formerly applied to the collection of

any heavenly bodies forming an entire constellation, and used instead of that expression. It is now taken

and used instead of that expression. It is now taken to denote any small cluster of stars, whether forming part of a constellation or a distinct group.

ASTERN, ö-stern', in Mar., any distance behind a ship, as opposed to shead, which signifies before her; thus, if south is ahead, or on the line to which the stem is directed, north will be astern. It also signifies to act the hindin or at the hinder part of a ship, or towards the hinder part; as, 'to go astern.'

ASTEROIDS, de'ter-oids (Gr. aster, a star, and eidos, like), a number of small planets revolving between the orbits of Mars and Jupiter, four of which were discovered in the first decade of the present century, and the remainder since 1845. They are sometimes called planetoids, an expression meaning 'like a planet,'

which conveys a better idea of their character, in contradistinction to fixed stars; and estra-sodiacal planets, because their orbits, unlike those of the larger planets, are not confined within the zodiac. The larger planets, are not confined within the zodae. The entire number discovered up to the present time (1870) is ninety. Flora, the eighth in order of discovery, is nearest to the sun, with a mean distance of 209,170,000 miles; and Euphrosyne, the thirty-first, the most distant, being about 300,000,000 miles from the centre distant, being about switch, which into the centre of our solar system. The great space that intervenes between the orbits of the planets Mars and Jupiter led Kepler to imagine that there must be a planet revolving between them which had hitherto escaped observation through the smallness of its size; and this supposition was subsequently strengthened by the discovery of a formula known as Bode's law (see Bone's Law), by which the respective distances of the planets from the sun were represented by certain numerical values, the approximate truth of which is shown by reference to their actual mean distances.

ASTERCLEPIS, ās-ter-o-le-pis (Gr. aster, star, lepis, scale), in Geol., the star-scale, a gigantic fossil ganoid istate, in tool, the star state, a grant to sai gatout fish of the Old Red sandstone, so unused from the starshaped markings on the strong plates which protect the head. The structure of this creature is minutely described in Hugh Miller's work "Footprints of the

Creator: or, the Asterolepis of Stromness.

ASTROPHYLLITES, de'ter-of'-ldies (Gr. aster, star, phullon, leaf), in Geol., fossil plants found abundantly in the Coal-measures, Lias, and Oolite, characterized by star-like whorls of narrow leaves surrounding the jointed stems, as in the existing genera Hippuris

and Equiretum.

and Equisclum.

ASTHA, isth'-mā (Gr. asthmazo, I breathe with difficulty), in Med., is a disease of the lungs, characterized by difficulty of breathing, which comes in paroxysms, accompanied by a wheezing noise and a feeling of tightness across the chest. The fit occurs most frequently during the night, suddenly awaking the patient from sleep, who is obliged to assume an upright posture, to prevent suffocation, and to struggle and trust for health with the neverture of continues which must for breath while the paroxysm continues, which is usually for two or three hours. Though a terrible, it is seldom, in itself, a fatal disease. It is frequently it is seldou, in itself, a fatal disease. It is frequently hereditary, or it may arise from some inflammatory affection of the respiratory organs. Among the other causes that may give fise to it, are dwelling in a noist or impure atmosphere, cold, indigestion, mental anxiety. The paroxysms are generally preceded by languor, flatulency, headone, sichness, a feeling of anxiety, and a sense of tightness and fulness about the chest. Physicians usually distinguish three kinds of asthma,—the humid, dry, and spasmodic, according as they are, or are not, attended with cough and expectoration. During the paroxysms, gentle aperients and anti-spasmodic medicines are recommended. A and anti-spasmodic medicines are recommended. and anti-spasmodic medicines are recommended. A blister on the chest, bathing the feet in warm water, a cup of hot coffee, or the smoking of stramonium, are frequently of use. To prevent the return of a paroxysm, the exciting causes are to be avoided; the bowels to be kept gently open, the food to be light and nourishing, sudden changes of temperature to be avoided, regular and moderate exercise to be taken, and a change of climate or of situation to be tried. As regards this last, it has been found that some have here less subject to asthme in the courter others in been least subject to asthma in the country, others in the centre of a town.

ASTREA. (See CORAL, MADREPORE.)
ASTREA, ds-fre'-d, the name of one of the asteroids or planetoids revolving between Mars and Jupiter. It

being generally found at the junction of the shaft of a column with the capital and base. The Egyptians sometimes divided their columns into sections by clusters of astragals surrounding the shaft at intervals. It is generally plain, but sometimes careed to repre-sent reeds bound together with a ribbon, leaves, and beads of various forms. It Gunnery it is a moulding encircling a cannon about six inches from its mouth.

ASTRAGALUS, äs-träg'-ü-lus (Gr. astrayalos, a die), in Anat., is the name of the ankle-bone, or first bone of the foot, upon which the tibis moves. It is so called from being shaped like the die used by the ancients in

their games.

ASTRAGALUS, in Bot., a gen. of plants belonging to the nat. ord. Leguminosæ, sub-ord. Papilionuceæ. More than 250 species have been described, and most More than 250 species have been described, and most of them are hardy plants, either shrubby or herbaceous. The best-known British species are A. hypoglottis, the purple milk-vetch, and A. glycyphyllos, the inquorice-vetch. The species A verus, A. gummifer, A. creticus, and some others, furnish gum-tragacanth, or, as it is frequently termed in the shops, gum-dragon. Tragacanth exudes naturally from all parts of the above plants, or from wounds made in the stems. It is used by British manufacturers for stiffening crape and other light fabrics, and by the perfumers for making bandoline. In medicine it is employed for its demulcent and emolient properties and as a vehicle demulcent and emollient properties, and as a vehicle for the exhibition of more active substances. A. boöticus, an annual species, is cultivated in Hungary, Germany, and other parts of Europe, for the seeds, which are roasted, ground, and used as a substitute for. or an improver of, coffee.

ASTRAL SPIRITS, as'-tral (Gr. astron, a star : Lat. ASTRAL SPIRITS, & Later and (Gr. astron, a star; Later spiritus, a spirit), spirits that were supposed by those who studied demonology and witchcraft in the 15th century to hold the first place among demons and spirits of evil. The Chaldeans, and those who worshipped the stars and fire in the early ages of the world, believed that every object in the heavens possessed an animating spirit, as the human body possesses a soul. In the Medieval times the notion arose that these spirits were sither feller enterly or the spile of soul. In the Mcclawai times the notion arose that these spirits were either fallen angels, or the souls of the dead, or spirits deriving their origin from fire, whose location was the air. They were thought to exercise an influence for good or evil on every member of the human race. Paracelsus and the old alchemists

or the human race. Faracelsus and the old alchemists believed that every one had an astral spirit peculiar to him.—Ref. Chambers's Encyclopædia.

ASTRINGENTS, äs-trinj'-ents (Lat. ad, to, and stringo, I tie fast), substances which have the property of contracting or drawing together the muscular fibre, and which are employed medicinally for the purpose of absolving fluxes humanylage and distribus. The of checking fluxes, hemorrhage, and diarrhea. drugs most commonly used as astringents are alum, accetate of lead, catechu, oak-galls, and rhatany-root.

Most vegetable astringents contain tannin.

ASTROCARYUM, &-to-kair'-i-um (Gr. astron, a star, kuruon, a nut), in Bot., a gen. of palms, including about sixteen species, all natives of tropical America, and remarkable for the formidable spines with which the stems, lcaves, and other parts are armed. The fruits of A. Tucuma and A. aurumuru are eatable. The species A. valqare, the Tucum-palm, is cultivated by the Indians of the Amazon for the sake of the epidermis of the unopened leaves, which they make into dermis of the unopened leaves, which they make into strong and fine thread by twisting thin strips together. Beautiful hammocks are made of this tucum thread. The tucum-palm is much more lofty than the tucumapalm.

was discovered by Hencke, an amateur astronomer, at Driesen, in Germany, Dec. 8, 1845. (See Asterbands) Asteolable, if taken, a moulding, the section of which is a complete semicircle, projecting from a perpendicular dismeter, so called from its resemblance to the project state upper ends and bases of the shafts of columns, and the tended which they used for the same purpose. It is the most simple of all mouldings, being the only the old Greek astronomers to take the altitude of the start, so called from its resemblance to the project at the upper ends and bases of the shafts of columns, and from the entablatures of the Ionic, Corinthian, and Composite orders of architecture, and also in Roman Doric. It is the most simple of all mouldings, being the only one that can project from a plane surface without the aid of a fillet. Its chief use seems to be to bind the aid of a fillet. Its chief use seems to be to bind the different parts of columns and entablatures together,

# Astrology

the term was used to signify a projection of the circles of the sphere on a plane surface, which is now called a planisphere. (See PLANISPHERE.)

planisphere. (See Printsphere.)
Astrology, de-trul-ope (Gr. astron, a star, and logos, a word or discourse), an expression literally meaning the doctrine or science of the stars, but especially taken to signify the art of forcelling future events, and the good or evil fortune likely to befall any man during his lifetime, from the aspect of the however and the relative position of the planets and other heavenly bodies at the time of his birth. This art, which is commonly understood by the torm astrology, is properly called judicial astrology; for, in the early ages of the world, astrology included the science of astronomy, as well as the art of making predictions from the motions of the stars; the early predictions from the motions of the stars; the early predictions from the motions of the stars; the early astronomers, or rather astrologers, making astronomical observations entirely for the sake of acquiring an fusight into futurity, as they imagined. The history of the rise and progress of astrology is nearly the same the fine and progress or astrology is nearly the same as that of astronomy. Its decline may be dated from the time of Copernicus, who showed that the sun was the centre of our solar system, and not the earth, as it had been formerly supposed; and, although this is no argument against the truth of the science, yet the fact that all calculations with regard to the motion of the heavenly bodies had hitherto been based on erroneous suppositions, was mainly instrumental in disabusing the minds of men generally of any reliance that they had previously placed on the deductions derived from the exercise of the art. All astronomers, including Kepler himself, up to his time, have been more or less infected with the idea that their science gave them the power of foretelling events that were about to happen; and remarkable instances have occurred of the verification of astrological predictions; but no one, on reflection, can assert in earnest that the aspect of the heavens at the time of birth can have the slightest influence on a man's character, disposition, and fortunes. If it were so, all who are horn at the same moment (and it is cal-culated that about sixty births occur throughout the world every minute) must necessarily run the same career; and consequently all those who were born at the same time as the emperor Napoleon or the duke of Wellington should have met with similar fortunes. Although at the present time all the people of Eastern nations are believers in astfology, especially those who profess the Mahomedan faith, it is astonishing that this pretended science should even now be practised in England, and that so many are credulous enough to purchase almanacs and other works which profess to foretell coming events, and even to place reliance on the statements put forth in them. The practice of astrology was universal among the Oriental nations at a very early age; and, although its origin is involved in obscurity, it may probably be attributed to the Chaldeans. The Hindoos and Chinese have always attached the greatest importance to it, and the Arabs sedulously cultivated the art, as well as the astronomers who flourished in Egypt before and after the birth of our Saviour, at which period it is considered to have been introduced into Western Europe. The Jews practised it after the return from the captivity in Babylon. It appears that the Greeks were the only ancient nation that gave no credence to the revelations of its professors. As many expressions are met with in the works of our old English authors and dramatic writers which are unintelligible without some idea of the broad outlines of the science, it may not be out of a very early age; and, although its origin is involved the broad outlines of the science, it may not be out of clase to give a brief sketch of its leading principles and the manner in which it was practised. The heavens above and below the horizon were divided by imaginary solve and below as followers were that by magnary oricles, drawn through its north and south points, into twelve equal parts, which were called the twelve houses of heaven. They were numbered in order from the division in the east immediately below the horizon the civision in the east immediately below the horizon which contained the part of the heavens about to rise into yiew. The lines of division were supposed to remain immovable, so that every part of the heavens passed through each house successively once in twenty-four hours. The term horoscope was given to the point of the scriptic about to rise. The first house was palled the accordant, it was the first house point of the scapace bout to rise. The invasion was called the ascendant: it was the strongest, and also known as the house of life; the second was the house of riches; the third, of brethren; the fourth, of 150

#### Astronomy

parents and relatives; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignitise (this houserwaked next in importance to the first); the eleventh, of friends; the twelfth, of foes. To each division one of the heavenly bodies was assigned as its lord, who was most powerful in his own house. The position of a planetein any house was its distance from the boundary circle or cusp of the house measured on the zodiac; and the part of the zodiac which chanced to be in each house was a point which especially demanded the attention of the astrologer in his consideration of the aspects of the various divisions. The relative position of the heavenly bodies in the different houses at any particular moment was called a theme; and to east the nativity of any one was to form a plan of the heavens in the manner above indicated at the moment of birth.—Eq. Sibly's Occult Sciences; English Cyclopadia—Arts and Sciences.

ASTROLOMA, às rho-lo-mà (Gr. astron, a star, and lobos, a pod), in Bot., a gen. of plants belonging to the nat. ord. Epacriacee. The species A. kumiyas yields the Tasmanian eranberry. This fruit is about the size of a blackcurrant, but is of a green or yellowish colour, sometimes tinged with red, and consists of a viscid apple-flavoured puby, inclosing a large seed. The flowers are of a beautiful scarlet.

ASTRONOMY, astron-o-me (Gr. astron, a star, no-mos, law, rule), the science which gives us an insight into the wonderful construction of the universe, and makes us sequainted with the motions and relative positions of the heavenly bodies. It may be considered as consisting of two great divisions,—practical astro-nomy and theoretical astronomy. Under the former may be classed the labours of the astronomer in his observatory, surrounded by instruments of various kinds, that have been brought to the greatest perfection by the accumulated experience of a long series of years, acquired by the careful observation and research of human intellect of the first order; while under the latter must be placed the calculations of the mathe-matician, who can correct, by computation, the slight errors to which observations made by the best instruments are always liable, and determine the distance, shape, size, orbits, and even weight, of the numerous celestial bodies, as well as the occurrence of celipses and other phenomena, and construct tables of the rising and setting and other ephemerides of the sun, moon, and planets for years in advance, such as those which are found in the Nautical Almanac, for the instruction and guidance of sailors, who find them of the utmost value in determining the position of their vessels and their course from one part of the world to another. Fractical astronomy requires an intimate knowledge of the construction and working of the various instruments by which observations are made, Notices of these are to be found under their respective headings. (See Circum, Sidereal Clock, Equaheadings. (See Circle, Sideneau Cools, Tonial, Transit-Instrument, Pendunce, roblat, Transit-Instrument, Pendudum, Telescore, &c.) Theoretical astronomy, which includes, with the operations of the mathematician, that branch of the science which has been called physical astro-nomy, or the consideration of the observations of astronomical phenomena so that the causes of these astronomical phenomena so that the causes of anome phenomena may be discovered, and the laws of nature which influence them may be deduced, is also treated under the names of the principal subjects which particularly belong to it. (See ADRHATION, GRAVITATION, GEODESY, LIBRATION OF THE MOON, PARALLAY, PER-CESSION OF THE EQUINORS, REFLACTION, TIDAL THEORY, &c.) Definitions of astronomical terms, and the nature of the heavenly bodies, as far as the limited power of man has hitherto been able to determine power of man has hinerto been able to determine them, are also given in their respective places. (See ASTREOIDS, COMPTS, MOON, PLANDER, FIXEN STARS, SUN, SOLAR SYSTEM, ZODIAC, &c.) The early history of astronomy is involved in considerable obscurity; but of all the sciences that have occupied the research of man, it is certainly the most ancient. The minds of the first inhabitants of the earth were doubtless conditioned to the search of the place. soon directed to the wonderful recurrence of the phenomens of day and night; the sun in the fall biase of his meridian glory, now scorching the eastern plains with the intensity of his heat, now welled with mists and clouds that hid for a season his welcome light and

warmth from those who, after a while, ignorantly worshipped his very presence. The changes in the pole moon, gliding over what was imagined to be a rault of saure crystal studded with countless stars, from the silver streak of the horned crescent to the broad shield of her orb at the full, would also be noted with wonder and amazement. Men would soon begin to remark the regularity of these changes, as well as the motion of some stars and the apparent immobility of others; and then records of these observations would be made, and the first link forged of the long chain of discoveries, smong which those of Tycho Brahe. would be made, and the first interest to the long chain of discoveries, among which those of Tycho Brahe, Copernious, Calileo, Kepler, and Newton are the most important, reaching to the addition of member after member to our planetary system, and the great im-provements in the science which have been made and are stills making in our own times. The Chaldreans are, perhaps, the first nation that cultivated astronomy, although the Chinese, Hindoos, and Egyptians equally claim to take rank as the originators of the science. The Greeks, also, were efficient astronomers, and did much for its advancement; they also have the merit of having followed up their observations for the sake of the science itself, while all the above-named people applied it to furnish means of inquiry into the future, and (with the exception of the Chinese, who made it subservient to state purposes), closely connected it with religious, or rather superstitious observances. It with religious, or rather superstitious observances. It may not be out of place to note briefly the claims of the contending nations to the honour of having originated the science. The Chaldman priests observed and placed on record the rising and setting of the celestial bodies, and eclipses of the sun and moon, from a very remote period, as it is stated by Diodorus; they understood the Metonic cycle (acc Metonic Cycle); they used the clepydra, or water-clock, to mark the lapse of time, and the gnomon and hemispherical dial, for determining solstices and the positions of the sun respectively. Alexander the Great. tions of the sun respectively. Alexander the Great, according to the old writers Simplicius and Porphyry, found at Babylon a list of eclipses from 2234 B.C., more than 1,900 years before the conquest of Babylon by that monarch, and sent them to Aristotle. The astromax monarch, and sent them to Aristotle. The astro-nomer Ptolemy mentions a few of these in his writings, the earliest of which is dated 720 n.c. They are, as may be imagined, but roughly made, the time being given in hours only, and the part of the diameter eclipsed within a quarter of an hour; but they happen to be the earliest recorded observations on which any dependence can be placed; and, by comparing them with observations of his own time, Halley was led to the discovery that the moon moves round the earth with greater rapidity now, than in the early ages of the world. The division of the celiptic into twelve equal parts (the twelve signs of the zodiac), and that of the day and night into twenty-four hours, are ascribed to the Chaldmans. The Chinese records of astronomical observations claim to go back to the year 2857 B.C. Nothing of importance is noted in them; a bare list of eclipses of the sun and the appearance of several comets is all that is given. That they were notoriously incorrect fully appears from the circumstance that many eclipses mentioned in this record have been remany eclipses mentioned in this record have been recalculated, and not one prior to the time of Ptolemy can be verified with anything approaching exactness. The Chinese were acquainted with the Metonic cycle and the motions of the planets; but they knew nothing about the precession of the equinoxes until about 400 a.n. The Hindoos rest their claim on a series of observations known set he "Tables of Tirradore," which are assumed to date from the year 3102 n.c., the beginning of the iron age of Hindoo mythology, when a extraordinary conjunction of the sun and moon and an extraordinary conjunction of the sun and moon and all the planets is said to have taken plane. These tables are telieved by competent judges to have been fabricated from data derived by the Hindoo astronomers from the Greeks and Arabs. It is, however, fair to add that there are many who contend that they were compiled from actual observations made by the Mindoos themselves, although commenced at a much later date than the epoch assigned for the beginning of the record. There is much in them that is correct; the earth, and the angalar obliquity of the celiptic technical they appear to be in many points a mean between the tables of an eminent Arabian philosopher, Albategnius, and those of Ptolemy, which seems to furnish in the time of Ptolemy. But the muster mind of the

atrong presumptive evidence of their compilation from these authorities. The Greeks derived their astrostrong presumptive evidence of their committation from these authorities. The Greeks derived their satro-nomical knowledge from the Egyptians in the first place; but the Egyptians have left no records of their observations. The pyramids, which are placed exactly north and south, are supposed to have had some satro-nomical use; and it has been amater of doubt whether the division of the zodiac should not be rather attri-heted to the Econolisms than the Chuldens With buted to the Egyptians than the Chaldmans. buted to the Egyptians than the Chaldwaus. With the Greek philosopher Thales, who flourished about 640 n.o., the real and reliable record of facts connected with the history of astronomy may be considered to commence. Thales is said to have predicted a total eclipse of the sun, which happened at the time he had forefold; but it is a question whether his success in this instance was purely accidental or accomplished by the aid of the Chaldwan Saros. (See Sanos, Chaldwan.) He was the first to show that the earth was a sphere, and not a plane surface, as the ancients imagnetic states of the chaldwan sarbers, and not a plane surface, as the accidents imagnetic states. a sphere, and not a plane surface, as the ancients imagined; and he also gave the Grecian sailors some idea gined; and he also gave the Greenin salors some idea of shaping their course by the stars. Pythagoras, who flourished about 500 B.C., did not consider the earth to be the centre of the universe, but, as it was afterwards shown by Copernicus, that the earth and other planets revolved round the sun. The only improvements and additions to the science before the Alexandrian school, which flourished in Egypt under the Ptolemies some 200 years later, are the introduction the Ptolemies some 200 years later, are the introduction of the Metonic or luni-solar zycle, of nineteen years, by Meton, 432 n.c., which was improved by Calippus about a hundred years afterwards; the first computation of the year of 3652 days, by Eudoxus of Cridius, 370 n.c.; and the idea of the daily revolution of the earth upon its axis, which was taught by Nicetas, a philosopher and astronomer of Syracuse, although the notion is said to have occurred to Anaximander some cennotions said to naveoccurred to Anaximanuer some cen-turies before, who also asserted that the light afforded by the moon was caused by the reflection of the sun's rays from that body. Hitherto everything connected with the science had been vague and unsatisfactory, rays from that nouy. All the second had been vague and unsatisfactory, mere guesses at truth,—guesses which, in the majority of cases, fell very wide of the mark; but with the astronomers of the Alexandrian school, a regular system of observation was commenced. The paths of the planets in their orbits were determined; the relative positions of the fixed stars clearly laid down, and the constellations or clusters of stars in various regions of the heavens, that had been grouped together and denoted by fanctivi outlines of figures of beasts, and burds, and human beings, referring, in many cases, to subjects connected with the old Greek mythology, were duly mapped out and catalogued. The first to subjects connected with the old Greek myshology, were duly mapped out and catalogued. The first Alexandrian school of philosophy may be considered to have existed for 175 years, from the time of Timocharis and Aristyllus, who flourished about 300 B.C., to the death of Hipparchus of Bithymia, the greatest of all the astronomors that lived before the Christian era. The second school commenced with Ptolemy, about 130 A.D., and ended with Pappus and Theon of Alexandria, early in the 5th century, when the Goths Alexandria, early in the 5th century, when the Goths had crossed the Mediterranean, and extended their ravages into Egypt and Northern Africa. The most celebrated astronomers in the first of these Alexandrian schools were Tinocharis and Aristyllus, whose joint observations proved of as much importance to Hipparchus as the rough records of eclipses observed at Babylon were to Halley, enabling the clever Greek to discover the precession of the equinoxes. Contemporary with these was Euclid, better known to us as a new three things in the confitted mathematician, but whose name must not be omitted here, since his clear and logical reasoning must have done much to pare the way for future discoverers, particularly those who turned their attention to the theory of the science. Some years later came Aristarchus of Samos, remarkable for being the first who attempted to ascertain the magnitude of the earth and its distance from the sun and moon, he was also in its distance from the sun and moon; he was also as believer in the Pythagorean theory, that the earth revolved round the sun. Another celebrated astronmer of this school was Eratochenes, who also turned his attention to the determination of the magnitude of the certific and the graphs ability of the certific and the graphs ability of the certific and the certification of the certific and the certific and the certification of the certific and the certific and the certification of the certific and the certification of the certific and the certification of the certification of the certific and the certification of the certification of the certification of the certific and the certification of the certifica

151

Astronomy Alexandrian astronomers was found in Hipparchus of Bithynia, who flourished from 160 to 125 s.c., the Newton of his age. He made a catalogue of 1,081 stars, determining the latitude and longitude of each, which is the first list on which any reliance can be placed, as those attributed to Eratosthenes and others are devoid of bearings by which they can be recognized and iden-tified. He fixed, with greater approximation to exact-ness than any of his predecessors, the length of the year, and demonstrated the inequality of the sun's motion. He made most important discoveries respect-ing the moon, determining her mean motion, her apogee and perigee, her parallax, and inclination of her orbit. He calculated eclipses, and discovered the precession of the equinoxes, as it has been remarked; and he was the first who gained an insight into the principles of plane and spherical trigonometry, or measurement by triangles. He also used right ascen-sion and declination for determining the places of the stars; but afterwards fixed their positions by latitude and longitude in preference, applying this method to ascertain the relative situations of places on the earth, storement the relative situations of places on the earth, thereby rendering as great a service to the science of geography as he had to that of astronomy. We may well wonder when we consider how much this old astronomer effected, and that all he did was done without aid from those instruments and appliances which prove such powerful auxiliaries to modern re-search. From the death of Hipparchus to the time of Room the death of Hipparchus to the time of Ptolemy, a period of about 250 years, no astronomer of eminence is met with, and no discovery of any practical utility was made. Ptolemy followed closely in the footsteps of Hipparchus, substantiating or altering the various theories which his predecessor had propounded. Among his chief discoveries were the libration of the moon and the refraction of light. He made a catalogue of the stars, based, most probably, on that of Hipparchus, with the positions corrected by the improvements he had been enabled to effect: he also invented a planetary system known as the Ptolemaic system (see Prolemaic System), which was generally considered to be the true principle of the motion of the universe, until Copernions revived and extended the system originated by Pythagoras. He wrote at great length on astronomy and mathematics, as well as on other sciences, embodying the result of his observations and his various dissertations in a work called "Megale Syntaxis," or the Great Collection, and, by the Arabs, the Almagest. (See Almagest). His successors, with the exception of Pappus, who wrote a commentary on his works, and Theon of Alexandria, were men of little or no note. After the death of these philosophers, the second school of Alexandrian also invented a planetary system known as the Ptoleandria, were men of little or no note. After the death of these philosophers, the second school of Alexandrian philosophy may be considered to have ceased, or, perhaps, to have languished until its total destruction by the Araba, then called Saracens, about the middle of the 7th century. Fortunately, the Arabs preserved the writings of Ptolemy, and, in the year 762 A.D., comcommenced a diligent prosecution of the study of the science, under the fostering encouragement of the Arabian caliphs; and although astronomy under the Arabian caliphs; and although astronomy under the Arabian caliphs can be also be any great discoveries. the Araban caupus; and although astronomy under the Araba was not extended by any great discoveries, yet the careful observations made by these people led to the correction and more accurate determi-nation of many elements of the science that had been sought out by the inquiring minds of the old Greek astronomers. The most distinguished old Greek astronomers. The most distinguished of the Arabian satronomers were Albategnius, or Al Batani, who flourished about 880, Ebn-Yunis, and Abul-Wefa. The first-named of these found out the motion of the sun's apogee. (See Anomalism Yrah.) He also made corrections in the calculation of the precession of the equinoxes, and advanced to a great extent in the knowledge of trigonometry, making use of sines and versed sines. Ebn-Yunis, who lived 1000 A.D., left many tables and results of observations, and was the first to employ subsidiary angles in his calculations. Abul-Weia, who lived at the same time, did

to the world in 1270; while Uleg Beg, a grandson of Timour the Tartar, made observations at Samarcand about the year 1433, and constructed the most correct catalogue of stars that had appeared up to his own time. This prince was as eminent as a geographer as he was as an astronomer. From this time, however, the study of astronomy has gone down among Asiatic nations; their knowledge of the science being solely kept up for the sake of the assistance derived in the prosecution of the study of astrology. In the early part of the 19th century, the attention of European nations was again turned to astronomy. Frederick II., emperor of Germany, ordered a translation of the Almagest to be made during his reign; and Alphonso X., king of Castile, collecting a great number of the most notable astronomers of the age about him, caused a set of tables to be compiled in the year 1263; which are known as the Alphonsine tables. (See Alonsins catalogue of stars that had appeared up to his own are known as the Alphonsine tables. (See Alonsing or Alphonsine Tables.) It was this monarch who was so puzzled by the intricacies and anomalies of the Ptolemaic system, that he gave vent to the remark, that if he had been consulted at the creation of the universe, he would have managed things far better and much more simply. From this time until 1500, nothing is worth recording in the history of astronomy. Copernicus was then twenty-seven years of age, and, attracted by the interest attaching to the study of this science, entered on his laborious researches with the eager and ardent thirst for fame and knowledge so common at his period of life in minds like his. The result of his investigations was a table of the notions of the planets, and a work on the Revolution of the Heavenly Bodies, in which he endeavoured to show the fallacy and error of the system of Ptolemy, intro-ducing in its place what has since been known as the Copernican system (see Coresina to the interest of the motion of the universe. He met with great opposition in the promulgation of his views; and his theory was not esteemed at its true and proper value, because he was unable to answer certain prior to the contract of t tain objections that were made to it, which have since been fully explained away. For thirteen years he boldly contended for the truth of his system; but he died, worn out in mind and body with the wearing toil died, worn out in mind and body with the wearing toil of thought and anxiety, a few weeks after his great work had been given to the world in a printed form. Many astronomers, of all climes and countries, laboured and wrote during the time that clapsed between the death of Copernicus and the year 1600; but of all these the most famous was Tycho Brahe, born 1540. Commencing the study of astronomy at a very early age, he soon determined to devote his life to the propertying of the science, and in 1550 ke here, his prosecution of the science; and in 1582 he began his observations on an island in the Baltic, near Copenonservations on an island in the Datic, near Copera-bagen. He did not adopt the system that had been suggested by Copernicus, but substituted a theory of his own, known as the Tychonic System, in which he asserted that the earth was the centre round which the sun moved, but that all the other planets which the sun moved, but that all the other planets moved round the sun, continually circling about him as he moved onwards in his course round the earth. This theory of Tycho Brahe was received more favourably than that of Copernicus, as there was no argument against it that could not be answered; and it explained all the phenomena of nature fully as well as the theory it was intended to supersede. In addition to the invention of the Tychonic system, he effected great improvements in the instruments then in use. He produced a catalogue of the fixed stars considerably more accurate than any which had preceded it, and made the first table of refractions. He also added greatly to what was already known of the motions of the moon, discovering the moon's variation and annual the moon, discovering the moon's variation and annual the moon, discovering the moon's variation and annual equation (see Equation, ANNUAL), the changing motion of her nodes, and the inclination of her orbit. He improved his tables by neglecting what was called the trepidation of the precession of the equinors, and made very important researches into the nature, course, and distance from the earth of comets, which were previously imagined to be atmospheric bodies. lations. Abul-Weis, who lived at the same time, did much for the improvement of trigonometry, using tan much for the improvement of trigonometry, using tan course, and distance from the sarth of somets, which gents, co-tangents, and secants, in addition to the sines and versed sines of Albategnius, and left tables of the cosine was introduced by Gebir, a Spaniard, some years later. Kepler and Galileo; the former of whom was born In Perzis astronomy had not been neglected. Nasir, 1571, died 1630, and the latter born 1563, died 1943c, eddin compiled tables of observations, and gave them

astronomy to the middle of the 17th century. Building astronomy to the middle of the 17th century. Building on the discoveries of Tycho Brahe, and his own investigations of the orbit of the planet Mars, Kepler was led to the conclusions demonstrated in what are called his First and Second Laws (see Kepler's Jaws), that the courses in which the planets move round the sun are ellipses, having the sun as one of the foci, and that the areas of the orbits are proportional to the times of revolution. His Third Law, that the squares of the periodic times of the planets are proportional to the cubes of their relative distances from the sun, was enumoisted in 1618, nine years after the discovery of cubes of their relative distances from the sun, was enundated in 1618, nine years after the discovery of the first and second laws. Kepler did much to establish the system of Copernicus, and to answer the arguments that had been previously urged against it. Hi last work was the compilation of the Rudolphine Tables, jublished about four years before his death. During the life of Kepler two inventions involved. During the life of Kepler, two inventions, invaluable to the prosecution of the science, were made. The telescope was first constructed in Holland by an optician named Lipperhey; and logarithms were invented in Scotland by Napier of Merchistoun, from whom the clever and gallant Napiere, that have made themselves famous in our own times, were lineally descended. Galileo greatly improved the original telescope, making one which magnified to the extent of a thousand times. one which magnified to the extent of a thousand times. With the aid of this instrument, he soon discovered the satellites of Jupiter, the ring of Saturn, and the phases of Venus resembling those of the moon, as well as the hills and valleys on the moon's surface. He also asserted the truth of the system of Copernicus, which drew on him the displeasure of Paul V., the monarchriest of Rome at that time; and, in the subsequent reign of Urban VIII., in 1633, subjected him to the tender mercies of the familiars of the Holy Inquisition, who wrested from him a recantation of the views he had so ably advocated. It will be impossible to do more than glance rapidly at the salient points in the growth of the science which appear previously to the among of Sir Isaac Newton. Gassendi, in 1631, had watched the transit of Mercury across the disc of the sun; Descartes, an eminent mathematician, had pubsun; Descartes, an eminent mathematician, had published his Cartesian theory; Vernier had invented an instrument, which bears his name, to determine the smallest subdivision of space (see VERNIER); Norwood had measured the meridian from London to York with great accuracy; Gascoigne, Auzout, and Picard had, independently of each other, applied the telescope to the quadrant, and the micrometer to the telescope; Huyghens had constructed the first pendulum clock, and Moreton had made use of the pendulum to assist him in his observations of the differences of the right him in his observations of the differences of the right ascension of the heavenly bodies; Gregory, in 1663, had constructed a reflecting telescope; and Cassini, with many other valuable discoveries, had ascertained the period of the rotation of Jupiter, and compiled the earliest tables of the satellites of that planet. Newton, who was born in the year in which Galiled and the desired that planet. Newton, who was form in the year in which Galleo died, was now twenty-four years old, and had already conceived a notion of the theory of gravitation, to which he is said to have been led by a train of thought arising from the observation of the fall of an apple. (See GRAVITATION.) It was many years before he could satisfy himself of the truth of his speculations, and determine the laws on which his wonderful dis covery rested; but he ultimately published it in his Principia, in 1687. By observations of the comet of 1680, Newton found that, in accordance with the laws propounded by Kepler, the orbits of comets about the sun were elliptic. He also invented fluxions, deterpropounded by Asserting the also invented fluxions, determined the form of the earth, and showed the influence of the moon upon the ebb and flow of the tides. In 1609 he constructed his first redicting telescope. He ended his useful life as an astronomer, mathematician, and philosopher, in 1727. Contemporary with Newton were Halley and Flamsteed, who held the post of first astronomer royal in the Observatory at Greenwich, founded in 1675. Flumsteed was as eminent a practical astronomer as Newton was skilled in physical estate. astronomer as Newton was skilled in physical astronomy. In 1880 he determined the laws of the moon's annual equation; and fourteen years later, in conjunction with Newton, he commenced a series of observations for the improvement of the theories then held respecting the moon's motions, and the laws which

Newton had arrived at respecting the reflection and refraction of light. He made a long catalogue of stars, in which important additions were made to stars, in which important additions were made to those that had already been published, and many series of astronomical observations, which were given to the world in his valuable *Historia Celestis*, which was brought out six years after his death. His successor Halley, who had made researches in the southern hemisphere at St. Helens, discovered the accelerated mean motion of the moon by the sid of the eclipses recorded at Babylon, and preserved in the Great Col-lection of Ptolemy. He also added considerably to our knowledge of the revolutions of comets and their our knowledge of the revolutions or gomes and mature. He was succeeded in his turn by Bradley, who discovered the aberration of light in the year tha Newton died; thus giving incontrovertible proof of the truth of the Copernican system, by determining the fact of the earth's annual revolution round the sun. (See ABRERATION.) It is impossible to give anything approaching to a clear and detailed account of the dis-coveries that recorded and better the sun. covories that succeeded each other with great rapidity from the death of Newton to the close of the 18th century, and the list of honourable names that added these tury, and the list of honourable names that added these discoveries to those of their predecessors, by their skill, perseverance, and research. In 1731 Hadley invented the quadrant; in after-years Bradley observed the phenomenon of nutation. Lacaille, Euler, D'Alembert, and Cassini produced valuable tables, and extended the valuable researches that had already been made in the theories of the motions of the planets, pression, rutation libration, and the advancing water of the planets, pression, rutation libration, and the advancing water. of the sun's apogee. Maskelyne, the fourth astro-nomer-royal, originated the Nautical Almanac in 1767. In 1781 Herschel discovered the planet Uranus, and Laplace calculated the elements of its orbit. Six years after, Herschel constructed his 40-foot telescope, with which he discovered two of Saturn's satellites and the rotation of his ring, as well as the satellites of Uranus, He also found that the Milky Way consisted of closelyare also assign that the minsy way consisted of closely-serried groups of countless stars, and that the motion of the satellites of Uranus was retrograde. The astro-nomical habours of the 18th century may be considered to be closed with the catalogue of nebulæ and clusters. of stars found by Herschel, and the commencement of the great work of Laplace, the Méchanique Céleste. Among the other notable inventions of the same century must be noticed the chronometers constructed by John Harrison, a mechanic of Foulby, near Pontefract, for which he received rewards that had been offered by parliament, amounting to about £25,000. In the opening years of the present century the discovery of the first four asteroids (see ASTERDIDS) between the orbits of Mars and Jupiter was made by Piazzi, Olbers, and Harding; and since that time no less than sixty-five have been added to this group; fully substantiating the idea entertained by Kepler, in consequence of the un-due space intervening between the orbits of the pridue space intervening between the orbits of the primary planets above mentioned, that one or more smaller ones must exist having their path between them. In 1846 the planet Neptune was discovered by a Freuchman named Le Verrier; but the credit of the discovery really belongs to Mr. Adams, of the university of Cambridge, who had acquainted Mr. Challis, professor of astronomy at that seat of learning, with the results of his investigations a twelvementh before the publication of the calculations of Le Verrier. This planet was first seen in the field of the heavens by Mr. Challis soon after he had learned the suspicious entertained of its existence by Mr. Adams; but M. Galle, of Berlin, was the first to place his observations of the newly-discovered heavenly body on record. In 1859 a new primary planet, having its orbit between Mercury and the Sun, was found by a physiciannamed Lescarbault: to this the name of Vulcan was approprintely given. Among the principal astronomical priately given. Among the principal astronomical publications of the present century may be enumerated Piazzi's Catalogue of the Stars, the most complete that we have; Herschel's Catalogues of Stars and Nebuse, and Brisbane's List of the same. Lubbock's researches on the Lunar Theory and his star maps are equally important; and the numerous publications of Airy, Laplace, Challis, and Lalande. Among the principal instruments constructed since the year 1980 may be noted Troughton's Mural Circle, put up at Greanwich in 1812, and the telescope erected at Parsonstown, in

Ireland, by the earl of Rosse. (See TELESCOPES.) Ref. English Cyclopædia—Arts and Sciences; Chambers's Encyclopædia; Lardner's Handbook of Astronomy.

and Museum of Science and Art.

and Museum of Science and Art.

ASTLUM, A-si-lems (Gr. a, not, and sulas, I roh), a sanctumy or piace of refuge to which criminals might fly for safety, and from which it was considered the greatest impiety to take them by force. The Israelites, by God's own appointment, set apart six cities as oities of refuge, to which those guilty of any unpremeditated offence might fly and find protection. The altar of burnt offering was also considered as a place of refuge. Among the Gregks, Thebes and Athens each claimed to have established the first asylum; that at Thebes by Cadmus, that at Athens by the descendants of Hercules. Romithe established an asylum at Rome, between the Romulus established an asylum at Rome, between the two groves on the Capitoline hill. The temples, altars, status, and tombs of heroes, were also anciently regarded as asylums, the temples being held as the most sacred and aviolable refuge. Under Constantine the Great, all churches were made asylums; and by the Grest, all churches were made asylums; and by the younger Theodosius, the privilege was extended to all courts, gardens, walks, and houses belonging to the churches. In 681 the synod of Toledo extended the limits to thirty paces from every church. At length these asylums led to such abuses, that they were generally abolished. (See Sanguaries). The term asylum is now applied to certain institutions whose object is to allaries the condition of the bling deed court is to alleviate the condition of the blind, deaf, and

damb, lunatios, and the destitute.

ASTMPTOTS, de'-im-tote (Gr. asumptotos, not falling together), in Geom., a line which approaches continually nearer and nearer to some curve, whose asymptote it is said to be, without ever meeting it. It is a property

appertaining to the hyperbolic curve.

ATAXIA, a-tax'-i-a (Gr. a, not, taxis, order), storm used in Med. to denote want of regularity in the

expmptoms of a disease or in the functions of the body.

ATCHEVEMENT, in Herald. (See ACHEVEMENT.)

ATELES, itt-e-less (Gr., incomplete), in Zool., a gen. of American monkeys, of that division of the Quadrumans termed Sapajons. The most distinctive characters of the arrangements of the grant area. characters of the genus are, long, slender, but powerful prehensile tails; fore-hands almost entirely without thumbs, or possessing only the merest rudiment of the organ,—whence the name of the genus; a dental system which, in common with all fae American Quadrumans, which, in common with an ene American Quadrumana, consists of two molar teeth more than are possessed either by man or by corresponding genera in the Old World. Other prominent characters of the ateles are round small heads, limbs remarkably long and slender, corpulent bodies. These characteristics have obtained corpulent bodies. These characteristics have obtained for the genus the name of spider-monkeys. Possessing nor the genus the name or spiner-monkeys. Nessessing neither cheek-pouches nor callosities, they are, in these respects, nearly allied to the real ages. Their entire physical conformation fits them to an exclusively arboreal life. Their mode of locomotion upon the earth is slow, awkward, and uncertain. Sometimes they grawl slong in a vacillating fashion, by using their lover forwarms as contiches; separatines they are long fore-arms as crutches; sometimes they urge themselves forward by poising themselves upon their hind-legs, and making use of their long arms and tail as a means of balancing themselves in this, to them unusual position. Naturalists and travellers relate derful stories of their docility, intelligence, many wonderful stories of their docility, intelligence, and affectionate disposition. Unlike the common monkey, they are grave even to melancholy, are neither flokke nor mischievous, and, in a domesticated state, are capable of exhibiting the strongest attachment towards a kind owner. Acosta, in his "History of the West Indies," gives the following anecdote of a quata, one of the apecies of the genus: he says, "They sent the quata to the tavern for wine, putting the pot in one hand and the money in the other. They could not nearly went the noney out of his hand before his not possibly get the money out of his hand before his pot of wine was full. If any children met him in the street, and threw stones at him, he would put his pot down and cast stones among the children, till he had assured his way. Then would he return to carry home his pot; and, what is more, although he was a good bribber of wine, yet he would never touch it till leave was given him. The genus Ateles comprehends the following account. onoper of wine, yet he would never rouch it in leave was given him. The genus Ateles comprehends the following species:—1. Ateles paniscus, or quata; 2. Ateles marginatus, or chuve; 3. Ateles uter, or cayou; 4. Ateles Belsebus, or marimonda; 5. Ateles melano-

cheir; 6. Ateles aracknoides, or brown quata; 7. Ateles hypoxanthus, the mono or miriki; 8. Ateles subpentadactylus, or chameck.

dactylus, or chameck.

Amelies Nationaux, or National Workshoffs, a-tel'-è-ai adr-i-o-no. — Since the year 1845, it was the custom in France, during severe winters, or in times of distress caused by stagnation of trade, to open temporary wogsahops, in order to give employment to labourers who were out of work. These workshops were called Ateliers de Charité, until the year 1848, when the provisional government of the resulting reconned a year unmber of these establishments. year 1888, when the provisional government of the re-public reopened a rast number of these establishments, under the name of Ateliers Nationaux. They were under the control of a department called "The Commit-tee of the Government for the Workmen;" they were all, however, badly organized, and failed calamigonaly. The principle on which they were conducted was, that every workman should have a living provided for him on a fixed scale. The result was, that workthen soon left private employers and entered the national workleft private employers and entered the national workshops. The numbers who flocked in soon became alarming. More than 100,000 men enrolled themselves, and insubordination soon began to show itself. Danger was imminent, and the National Assembly ordered the dissolution of the Ateliers Nationaux; an act which became the pretext for the terrible insurrection which ensanguined Paris in June, 1848.

A TEMPO, or A TEMP, a-tem-po, in Mus., a term signifying 'in time; of similar signification with a battata, and, like that expression, seldom used but when the regular measure has been designedly interrupted. When there has been some short relaxation in the time, a temp or a tempo denotes that the performer must return to the original degree of movement.

must return to the original degree of movement.

A TERMO CIUSTO, in Mus., a term signifying in equal and just time; an expression generally applied to the manner of performing a steady sound movement,—a movement less directed to the feelings than to the judement, more scientific than impassioned.

judgment, more scientific than impassioned.
ATHARSHAN (See BRETLE and SCARBEUS.)
ATHARSHAN CREED, ülh-ä-nal'-shi-än, a formulary
or confession of faith, said to have been drawn up by
Athanasius, bishop of Alexandria, in the 4th century,
to justify himself against the calumnies of his Arian
enemies. That it was really composed by this father
seems more than doubtful; and modern divines generally concur in the opinion of Dr. Waterland, that it
was written by Hilary, bishop of Arles, in the 5th
century. It is certainly very ancient; for it had become so famous in the 6th century, as to be commented
upon, together with the Lord's Prayer and Apostics'
Creed, by Venantius Fortunatus, biship of Poitiers.
It was not, hawever, then styled the Athanasian Creed,
but simply the Catholic Faith. It is supposed to have It was not, hawever, then styled the Athanasana Creed, but simply the Catholic Faith. It is supposed to have received the name of Athanasius, on account of its agreeing with his doctrines, and being an excellent summary of the subjects of controversy between him and the Arians. The true key to the Athanasian Creed lies in the knowledge of the errors to which it was opposed. The Sabellians considered the Father, Son, and Mark Sabellians considered the Father Son, and and sabellians considered the Father Son, and and sabellians considered the Father Son, and and sabellians considered the Sabellia opposed. The Sabellians considered the Father, Son, and Holy Spirit as one in person; this was "confounding the persons:" the Arians considered them as differing in essence; this was "dividing the substance;" and against these two errors was the creed stance: and against these two errors was the creed originally framed. The most exceptionable part of the creed is what is termed the "damnatory clauses:"—"Whoseever will be saved, before all things it is necessary that he hold the Catholic faith; which faith except every one do keep whole and undefiled, without catholic faith of the contraction of the c except every one do keep whole and undeffled, without doubt he shall perish everlastingly. And the Catholio faith is this,—that we worship one God in Trinity, and Trinity in Unity, neither confounding the persons nor dividing the substance." This creed is appointed to be read in the Church of England on certain days; and, regarding the "dannatory clauses," the commissioners appointed in 1688 to review and correct the littery and the thick there there have been described. the liturgy, say that they "are to be understood as relating only to those who obstinately deny the sub-stance of the Christian faith."

ATHERISM, all-the-izm (Gr. a, without, these, God), a word of comparatively modern invention as applied to that system of belief which professes to discard the extraction of the contract of istence of a deity. Many persons, both in ancient and modern times, and on very various grounds, have had the name of atheist applied to them; but it may be

# Atheling

justly questioned whether any same man ever adopted such a principle. No doubt many men have repudiated altogether the ordinary ideas of the Deity, both as to his character, and as to the methods of establishing the proof of his existence; and in a comparatively ignorant age, or among a comparatively ignorant race of people, such persons would very likely be set down as atheists by those who did not understand their peoplis renets. Again, such atheists as those among peculiar tenets. Again, such athelets as those among the Greek philosophers, as Leucippus, Democritus, and Protagoras, who went mainly upon the assumption that they had no proper idea of such an existence, were not really so far from certain modern Christians as might be imagined. From Kant to Dr. Mansel, of Oxford, philosophers like Sir William Hamilton have maintained what is commonly called speculative atheritations. maintained what is combined year and speaked active attempts their opponents, who profess to hold on by the dogmatic view of the existence of Deity, and who believe they can demonstrate his being. Everybody at all acquainted with the question knows that no demonstrate in the property of the property o all acquainted with the question knows that no demonstration,—no è priori proof,—of such an existence is possible, inasmuch as no notion can be formed of a higher generality than infinitude, to serve as the major premiss on which this alleged syllogism can rest. And hence, while no demonstration of such a being can be offered, ample speculative proof of his existence can be inductively reached. Without doubt, vulgar prejudice has had much to do with the atheism of many convent thinkers. From Scoreta downwards, but the minent thinkers, from Socrates downwards; but the Frenchmen of the 18th century made a boast of this creed, and vaunted it openly in the streets, as well as advocating it secretly in the closet. The remark of Lord Bacon was quite true, that though a smattering of philosophy might lead a man into atheism, a deep draught of it will assuredly bring him back to the

driught of it will assuredly bring him back to the belief in a God and in a divine providence. Atheling, Etheling, or Etheling, ith'-ling (Sux. athel- or ethel-boren, noble-born), a term employed in the Saxon period of our history to denote a particular kind of nobility. The atheling was originally a nobleman who possessed a certain amount of free lands, and was thus distinguished from the nobleman who owed service to the king, or held his lands under servitude. As, however, the king's retainers gradually acquired a supremacy over the landholding freemen, it is probable that the title atheling was transferred from is probable that the title atheling was transferred from is promise that the title attheming was transferred from the one to the other. This title was also applied to the eldest son of the reigning monarch, or the heir-pre-sumptive to the throne, to whom some believe that the term was confined. Lands were usually given to the atheling while still in his minority; probably in order to give the athel dignity.—Ref. English Cyclopædia— Arts and Sciences.

ATHENEUM, ath-e-ne'-um (Gr. athenaion), in Antiq., a public place frequented by professors of the liberal arts, and where rhetoricians declaimed, and the poets read aloud their works. At Athens these aspoets read aloud their works. At Athens these assemblies first took place in the temple of Minerva (in Gr., Athene),—whence the name. The Athensum at Rome was founded upon the Capitoline hill, by the emperor Adrian. It was a school or college, furnished with a complete staff of professors for the several branches of study. Like its Athenian prototypes, this establishment was frequented by the Roman orators, poets, and other learned men, who there declaimed their compositions, the emperors themselves frequently honouring the assembly by their presence. At a subtheir compositions, the emperors themselves frequency bonouring the assembly by their presence. At a subsequent period, another celebrated athenaum was erected at Lyons. These institutions, generally, appear to have retained their high reputation until the 5th century. At the present time, the term has been revived as a name for certain establishments connected with learning, as well as for clubs and libraries. It is also the title of three weekly literary journals; one published in London, one in Paría, and one in Germany.

### Athwart

of England; upon the eastern coast of England, well as in certain parts of Ireland, they are also to met with. At Brighton the atherine is called the sa

ATREBINE

smelt; and in several market-towns of England when the smelt is unknown, the atherine is commonly sold under that name.

under that name.

ATHEBOSPZEMACEE, āth'e-ro-sper-mai'se-e, in Bot., the Plume Nutmeg family, a nat. ord. of dicotyledonous plants in the sub-class Monochlamydee. There are but three genera, namely, Atherosperma and Dorphoro belonging to Australia, and Laurelia to Chili. Only four species are known, and these are all handsome and fragrant trees. Each produces fruit, consisting of a number of schemia inclosed in the tube of the calvy, and having naviatant stries which have grown into and having persistent styles which have grown into feathery awns. The achieving of Laurelia have an odour very similar to that of the common nutmeg. Atherosperma moschata furnishes valuable timber, also an aromatic bark, which is used in some parts of Australia as a substitute for China tea.

tralia as a substitute for China ten.

ATHLYTES, āth-leets' (Gr. athletai), were those persons who, among the Greeks and Romans, contended for prizes (athla) at the public games, in boxing, wrestling, running, leaping, and throwing the disc. Unlike the agouistes, who only pursued gymnastic exercises as a means of improving their health and bodily vigour, the athleta devoted their whole lives to preparing for the contests at the public games. For these they were trained with the utmost care. They were constantly undergoing a course of the most several were constantly undergoing a course of the most severe exercise, in a gymnasium set apart for the purpose, under the superintendence of the gymnasiarch. An officer named the aliptus directed their diet, which, although regular in its nature, was enormous in quantity. They usually slept for a very long time. At first the athletes, when struggling for the prize, wore a girdle round their loins; but algerwards they contended in a nude state. Before commencing wrestling encounters, their bodies were covered with sand, that they might grasp each other the more firmly. In other games they were anointed with oil by the aliptus. An athlete who gained the prize at either of the four great public games,—viz., the Olympian, Istamian, were constantly undergoing a course of the most severe. an athete was gamed the brise a cluser of the tour great public games,—viz., the Olympian, Isthmian, Nemean, or Pythian, was received by the state to which he belonged with the greatest honours. A breach was made in the city walls specially to allow of his entrance in a chariot drawn by four white horses. his entrance in a chariot drawn by four white horses, On entering within the city, he was conducted to the temple of the presiding deity, where hymns were chanted in his praise. A successful athlete was absolved from the payment of taxes; often his status was set up in a public spot; and in battle he fought in a distinguished place. Athletes were, it is stated, introduced from Greece into Rome by M. Kulvins, at the alease of the Alease of the Takinn rear 186 M of They excelled. the close of the Ætolian war, 186 B.C. They speedily became highly popular; and, under the emperors, their contests were admired by the nation to a degree bordering upon passion. Under Noro an enormous number of athletes lived in Rome, where, however, they were hirelings, and lived separately, forming, by themselves, a distinct corporation. The athlete were an entirely different class from the gladiators. (See CLADIATORS.)

Among the Greeks there were no gladiators.

ATHWAET, a-thworf, in Mar, across the line of aship's course; as, "a fleet was discovered standing athwart our course,"—that is to say, steering across our way.

Athwart-hawse is the situation of a ship when she is many.

Atherina, &th'-e-rin (Lat. atherina), a gen. of fishes, formerly classed with the Mullet fam., but now separated from them. They rarely exceed six inches in lougth, and have a rather flat upper jaw. Some possess, but given the subject of the fight of a cannon-bull, very small teeth, while others are entirely toothless. all the known species have a silvery stripe on each state of from one ship across the line of another's All the known species have a silvery stripe on each to side of the body. In the Mediterranean they are very numerous, and they also abound on the southern coast from side to side, or in that direction.

#### Atlantes

ATLANTES, OF ATLANTIDES, &t-lan'-toes (Gr. Atlas),

ATLANTIDES.

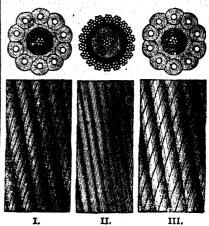

in Arch., a name given by the Greeks to male figures used instead of columns or pilasters to support entablatures. The name was derived from the idea of Atlas bearing the heavens on his shoul-ders. The Egyptians were in the habit of attaching colorsal figures of this kind to the columns of their temples, which probubly suggested the use of them to the Greeks. These figures are some-times called Telamones or times called Tenamones or Persians. In the modern architecture of Italy, At-lantes are frequently to be seen, supporting the en-tablature above the entrance of a great building. When female figures are made use of for the like

purpose, they are termed rides.) In Astron., the Caryatides. (See CARYATIDES.) In Astron., the name Atlantides is applied to the Pleiades, seven stars representing the daughters of Atlas, supposed to have been turned into a constellation after death.

have been turned into a constellation after death.

ANLANTIO TELEGRAPH, at-lön'-tik (Lat. atlanticus;
Gr. telos, far, distant, and graphein, to write).—
The success of various attempts to send messages
by electric agency through cables lying under water
for short distances, induced Professor Morse, of
New York, to suggest the possibility of uniting
England and America by a submarine cable, laid from
shore to shore throughout the Atlantic Ocean. In
1845, Mr. J. W. Brett registered an association, under
the name of the General Oceanic Telegraph Company,
to carry out the object above mentioned, and to connect England with the continent in various parts. The to carry out the object above mentioned, and to con-nect England with the continent in various parts. The latter part of his design was successfully accomplished in 1851, and public attention was, in consequence, again directed to the junction of England and America by similar means of intercommunication. Newfound-land had already been united to the mainland of America by submarine cable; and, in 1856, the Atlantic Tellegraph Company was formed with the design of Telegraph Company was formed, with the design of laying a cable between St. John's, Newfoundland, and Valentia, in Ireland, along the bottom of the Atlantic in its most shallow part, which had been pointed out for the purpose by Capt. Manry, and called by him the Telegraphic Plateau. Pecuniary assistance was guaranteed to the company by the respective govern-ments of Great Britain and the United States, and ments of Great Britain and the United States, and both powers agreed to furnish ships for taking out the cable and placing it in its destined bed. On Aug. 5, 1837, H. M. S. Agamemnon and the United States frigate Niagara, with the cable on board, commenced operations at Valentia. The cable broke twice, and the vessels returned to England after the failure of the second attempt. Another trial, in the month of June, second attempt. Another trial, in the month of June, 1858, was frustrated by a violent storm; but on the 29th of July, the parts of the cable in each vessel were united about the middle of the Atlantic, and the ships parted company, the Agamennon for Valentia, and the Niagara for Trinity Bay, Newfoundland. On Aug. 5 both ressels had arrived at their destination without railed to and a phase of summing the street three controls. accident, and a chain of communication was thus completed between the great commercial nations of the Eastern and Western hemispheres. Unfortunately, Eastern and Western hemispheres. Unfortunately, early in September there was a perceptible difficulty in the transmission of signals, which continued to increase until they became totally unintelligible, and the cable soon afterwards became entirely usaless. In 1860 a new company was formed; the Great Eastern was engaged to lay down 2,300 miles of wire, and upon July 15, 1865, the vessel sailed from the Thames for Valentia, under the command of Captain, afterwards Sir James, Anderson. The Great Eastern commenced paying out the cable, but telegraphic communication between Valentia and the vessel ceased on August 2. This interruption was from the Thames for Valentia, under the command of Captain, afterwards Sir James, Anderson. In the cable is 37,163 knots, weighing 4,727 tons; of the telegraphic communication between Valentia and the vessel ceased on August 2. This interruption was

due to defective insulation. The sparatus on board the Great Eastern for raising the wire proving insuf-ficient, the vessel returned to the Medway, where it anchored on Aug. 19, 1865. In July of the follow-ing year a fourth and successful attempt was made by the Great Eustern, and a new calle was laid between Valentia and America. After completing this task, the vessel proceeded to hall up the lost cable of 1865. On Sept. 2, 1866, the oable was grappled, after ten unsuccessful attempts, the bight brought on board the

Great Eastern, a splice effected, and, sbortly afterwards, telegraphic communication by means of two wires was carried out between this country and America. The dimensions and weights of the three Atlantic cables are as follows:—First Atlantic. Length, as laid, 2,022 knots; copper conductor 7-wire strand, weighing 107 lb. per knot, diameter 0.093 in.; covered with gutta-percha, weighing 200 lb. per knot, diameter 0.738 in.; served with tanned hemp and covered with 18 strands of seven bright charcoaliron wires, 0.028 in. diameter; total diameter of cable, 0.62 in.; weight of cable in air per knot, 21.7 cwt.; in water, 18:3 cwt. Second Atlantic.—Length when corplete in 1866, 1,806 knots; copper conductor 7-wire strand, weighing 300 lb. per knot, diameter 0.114 in.; covered with gutta-percha and Chatterton's compound, weighing 400 lb. per knot, diameter 0.464 in.; served with wet tanned hemp covered with ten bright steel wires, each inclosed in fire tarred Manilla hemp strands,—diameter of each wire, 0.036 in.; diameter of strand, 0.28 in.; diameter of cable, 1.125 in.; weight of cable per knot, in air, 35° cwt.; in water, 14 cwt. Third Atlantic.—Length as laid, 1,858 knots; similar to 1865 cable, except that the ateel wires were galvanized and the Manilla strands were not tanned, but left white; weight in air, 31 cwt.; in water, 14¢ cwt.; breaking strain, 8 tons. Appended are three drawings made to scale, which show the relative proportions of the three Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic cables. In July, 1869, a cable across the Atlantic Great Eastern, a splice effected, and, shortly after-12 ton per knot, in water its specific gravity is about 15 cwt.; and in regard to strength it will bear a strain

ATLAS, ill-lis, a name given to any number of maps collected in the form of a volume, probably because old works of the kind had a figure of Atlas bearing the world on his shoulders engraved on the title page Boucher imagines the name to be derived from the

Boucher imagines the name to be derived from the German atlass, satin, because maps were usually printed on soft paper with a glossy surface like satin.

Allas, in Anat., is the name of the first vertebra, so called either from the Greek verb atlac, I sustain, or from Atlas, who was fabled to support the world upon his shoulders. It differs from the other vertebras upon his shoulders. It differs from the other vertebres in having its body small and thin, and its foramen very large, being in form somewhat like a ring. It is connected above with the condyles of the occipital bone, and receives the tooth-like process of the second cervical vertebrs from below, the former admitting of moving the head up and down, the latter from side to

ATMIDOMETER, it-mi-dom'-e-ter-(Gr. atmos, vapour; metron, a measure), an instrument, the invention of Mr. Babington, used to ascertain by measurement the evaporation from water, snow, or ice. Its construc-tion is as follows:—Two hollow copper or glass bulbs tion is as follows:—Two hollow copper or glass bulbs are connected by a contracting neck, the lower bulb being weighted by shot or mercury. Upon the upper bulb is placed a scale marked to show grains and half-grains, above which is a small metal pan. On immersing this instrument in water, and distilled water being slowly poured into the pan, it is made to sink until the zero of the graduated atem is brought to a level with the cover of the vessel in which the water is contained. This stem rises as the water in the pan evaporates, the amount of evaporation being marked on the scale. ATMOLYBE. di-molif-zer (Gr. atmos. vapour: lusis.

ATMOLYSER, il-mo-li'-zer (Gr. atmos, vapour; lysis, a loosing), an instrument devised by Mr. Graham, the master of the Mint, to illustrate the application of diffusion through a porous septum as a practical analytical nusion through a porous septum as a practical analytical method of separating mixed gases. The apparatus is thus constructed:—The stalk, about two feet long, of a Dutch tobacco-pipe, having an internal diameter of about 2:5 millimètres, is fixed by means of perforated corks within a glass or metallic tube some inches in length, and about an inch and a half in diameter (w, i), as in the construction of a Liebig condenser. Another quill tube (v) is inserted in one of the end corks affording the means of communication between corks, affording the means of communication between the annular space and the vacuum of an air-pump. The external surface of the corks and those portions of the pipe-stem which project outside the tube should be coated with varnish, to render them impermeable to air. A vacuum is next obtained within the large outer tube, and the mixed gas is then made to enter

and pass through the porous tobacco-pipe. A portion of the gas is drained off through the porous tube and or the gas is trained on through the porous tine and pumped away, whilst snother portion passes on through the other extremity of the clay tube, where it may be collected. The stream of gas diminishes as it proceeds. The lighter gas is drawn most largely into the vacuum, leaving the denser gas in a more concentrated state to pass away through the exit end of the clay tube. The more slowly the mixed gas is moved through the tube, the larger will be the proportion of light gas which has been drawn off into the vacuum, and the more concentrated will the heavy gas become. The rate of flow of the mixed gas can be regulated by discharging it from a gas-holder or drawing it into a gas-receiver under ascertained pressure. In his communication to the Royal Society, Mr. Graham gave the following, among other results:—A mixture of 1 measure of cygen and 2 of hydrogen was passed at the rate of cygen and 2 of hydrogen was passed at the rate of giltres per hour; 0.45 litre of the mixed gas was collected. Before traversing the atmolyser it contained 0 39.3, H 66.7; after traversing the apparatus it contained 0 90.7, H 9.3. The result of this experipumped away, whilst another portion passes on through

ment was very striking, as the mixture before traversing the tube was explosive, but after its passage through the porous aperture it cassed to be so, and a lighted taper burnt in it as in pure crygen. (See Diraverox or Casses).—Ref. Graham On the Molecular Mobility of Guese, published in the Transactions of the Royal Society for 1863.

ATMOLYME, M. mol. is for, atmost veryour, here, a

Royal Society for 1863.

ATHOLYSIS, itt-mol'-s-sis (Gr. atmos, vapour; lysis, a loosing), a method of separating the constituent gases of a compound gas—as, for instance, atmospheric air—by causing it to pass through alporous material such as graphite. It was first made known by Mr. T. Graham, master of the Mint, in 1863.

ATHOMERER, itemon'-s-ter (Gr. atmos, vapour; metron, a measure), an instrument for measuring the quantity of water evaporated under given circumstances. If it were not for the variety of causes which influence the process of evaporation at the earth's surface, an atmometer would be a simple instrument. face, an atmometer would be a simple instrument. A lace, an atmometer would be a simple instrument. A quantity of water, after being weighed, would have to be exposed in a measured vessel to the action of the atmosphere; the difference in weight, after the experiment, would give the amount of evaporation. But meteorological and other causes so affect vaporous exhalations at the surface of the earth, that no accurate atmometer has hitherto been constructed.

Amosphere, it mos-feer (Gr. atmos, vapour, and sphaira, sphere), the name given to the gaseous envelope of the earth. It partakes of the rotatory motion of our planet, and would remain unmoved relatively to terrestrial objects, were it not for local circumstances, which produce winds, and are constantly disturbing its equilibrium. The composition and most of the chemical properties of the atmospheric ocean are described mical properties of the stonespheric ocean are described in another portion of this work (see AIR); but some additional particulars may be given here. It has been calculated that the atmosphere contains 2,551,586 billions of pounds of oxygen, and that the yearly consumption of this single gas by men and animals (see RESPRATION), together with the quantity abstracted in the ordinary processes of combustion, must amount to two and a quarter billious of pounds. Thus, in a hundred years, the consumption of exygen would only reach 220 billions of pounds,—that is, not even the ten thousandth part of the whole. Carbonic acid exists in the atmosphere in very small proportion. At ordinary elevations there are only about two gallons of this gas in every 5,000 of air, or around part of the whole. It increases, however, as we ascend; so that, at heights of 8,000 or 10,000 feet, the proportion is nearly doubled. By the second increased quantity is very small; and yet the presence of carbonic acid in the atmosphere is essential to the existence of vegetable life on the surface of the earth. (See VEGETABLE KINGDOM.) surface of the earth. (See VEGETABLE KINGDOM.)
Carbonic acid is being continually produced by the
respiration of animals, the processes of combustion,
and the decomposition of organic substances; so that and the decomposition of organic substances; so that there is no danger of the supply required by growing plants ever falling short. Boussingault has estimated that the quantity of carbonic acid produced in Paris every twenty-four hours amounts to nearly a hun-dred and six millions of cubic feet. The atmosphere, as a chemical agent, acts principally by oxidizing bodies exposed to its influence, more especially metals. The amount of animonia, one of the products of the decomposition of animal substances, averages from 1 part to 6 in every 10,000 parts of air. Sulphuric acid and sulphuretted hydrogen, products of the combustion of coal, are found in proportions varying from 0 to 42 parts in 10,000. Hydrochloric acid is also found of moisture in the sir increases its chemical effect. It varies according to weather and locality. The chemi-cal influence of the air is seen in the disintegration of the hardest granitic and felspathic rocks, which gradually crumble away under its action, forming the kaolin or China clay of the potter. The combined effects of or Luma ctay of the potter. The combined effects of air and moisture on magnesian limestone are wofully apparent in the condition of the new Houses of Parliament. Wood decays when exposed to the air by slow combustion at ordinary temperatures, or eremacausis, as it is called by Liebig. A certain amount of moisture and heat is necessary in this case, as perfect dryness and a temperature below freezing-point arrest this slow oxidation or decay. Linen damped and

exposed to the air gradually leass weight; the carbon of the fibre uniting with the oxygen of the air to form carbonic acid. After a time, the fibres become so disintegrated, that they fall to powder, or become rotten. Motals for the most part rust, or become converted into oxide, in moist air; giving rise to precisely the same compound, as if they were burnt in the fire. Iron is easily rusted; hence it is galvanized, —i.e., covered with a coating of zime or tin, these metals having much less affinity for oxygen. The decay of iron is much sided by the presence of another metal. Thus the lead by which railings are attached to stonework sets up a galvanic action as soon as it is wetted; Thus the lead by which railings are attached to stone-work sets up a galvanic action as soon as it is wetted; the result being, that the iron decays very quickly at the point where it joins the lead. The action of the air on metallic paints containing lead is very marked; they become speedily tarnished by the absorption of sulphur. Even glass is affected in this way, lead-glass especially becoming covered with a film of oxide or sulphide, from prolonged exposure to air and damp. Gold, aluminum, and one or two other metals, remain metarnished by exposure is in the liter seen be. untarnished by exposure to air; but silver soon be-comes covered with a film of sulphide. From the above facts, the reason for gilding, plating, and painting metals and wood is made apparent. The painting metals and wood is made apparent. And atmosphere exercises an immenso pressure on the whole surface of the earth. At the ordinary sea-level this pressure equals nearly 15 lbs. on every square inch. On ascending above the sea-level, the pressure dimi-On accending above the sea-level, the pressure diminishes; and, on descending below,—in a coal-mine, for instance,—it increases. The atmospheric pressure was first determined in 1643 by Torricelli, a pupil of Galileo. (See BAROMETEE.) By virtue of the expansive force of air, it might be supposed that the molecular world covered color with the molecular world covered colors. sive force of air, it might be supposed that the non-cules would expand indefinitely into space; but, in proportion as the air expands, the expansive force decreases, and is further weakened by the low temperature of the more elevated regions; so that, at a certain height, an equilibrium is established between the expansive force which separates the molecules and the action of gravity which draws them towards the earth. It is therefore concluded that the atmosphere earth. It is therefore concluded that the atmosphere is limited. From the weight of the atmosphere and its gradual decrease in density, and from the observation of certain phenomens of twilight, its height has been estimated at from thirty to forty miles. At that height the air is extremely rarefled; and, at the height of sixty miles, it is assumed that there is a perfect vacuum. Recent observations made by Liais, a Franch agant in the two large to have because. a French savant, in the tropical zone, have, however proved that the atmosphere extends to a much greater height,—in fact, to between 198 and 212 miles. The pressure of a column of air upon the upper surface of a body is balanced by the expansive force of the air acting upon the under surface. Thus, the weight of the air supported by the hand can only be made sensible by placing the hand can only be made sensible by placing the hand over the mouth of the open receiver of an air-pump, and removing the sustaining air.

With a piece of bladder

MAGDEBURG HEMISPHERES.

the receiver, the crushing force of the atmo-sphere may be illustrated in a very striking manner. As soon as a tolerable vacuum is produced in the receiver by working the air-pump, the bladder is depressed by the weight of the atmosphere above it, and finally bursts with loud report, caused by the sudden entrance of the air. Of the many forms of apparatus which have been devised to demonstrate the existence of the atmospheric pressure, none equal the Maqde-

tied over the mouth of

which are ground to fit closely, and well greased. One of the hemispheres is provided with a stopcock, by which it can be screwed on the air-pump or to an ex-heasting syringe, and the other is provided with a handle. As long as the hemispheres contain air they can be separated without any difficulty, for the external can be separated without any dimensity, for the external pressure of the atmosphere is balanced by the elastic force of the air in the interior; but when the internal air is pumped out, the hemispheres cannot be separated without a powerful effort; and, as this is the case in whatever position they are held, it follows that the atmospheric pressure is transmitted in all directions. atmospheric pressure is transmitted in an uncettons. The average pressure at the sea-level is usually taken at 14.6 lbs. avoirdupois on the square inch, or just sufficient to support a column of mercury 30 inches in height; hence a column of 60 inches will be equal to two atmospheres, a column of 90 inches to three, and so on. It is customary to estimate the four of steam and other fluid pressures by dimensioner—that is in and other fluid pressures by atmospheres,—that is, in round numbers, at the rate of 15 lbs. per square inch for every atmosphere. (For information respecting other points connected with the atmosphere, see Airs, FLUID, ACOUSTICS, METEOROLOGY, DRW, RAIR, TEMPERATURE, WIND, AREMOMETER, BAROMETER, HYGROMETER, RAIN-GAUGE, THREMOMETER.)—Ref. Ganot's Physics.

ATMOSPHERE OF THE PLANETS.—From a great variety of analogous circumstances proving the common origin of the earth and the other heavenly bodies, there is strong reason for believing that many, if not all, of the planets are surrounded with gaseous envelopes or at-mospheres. It is not, however, assumption alone that leads to this opinion; the telescope reveals to us such changes in the appearance of many of the planets as can only be accounted for by the fact that they have can only be accounted for by the fact that they have atmospheres. Mars, Jupiter, and Saturn have, in this way, been proved to possess a transparent atmosphere, varying at different times and places, like that of our own planet. Upon the earth, air is essential to the existence of living beings, and there is a probability almost amounting to a certainty, that the other worlds revolving round our sun have inhabitants, whose exist-tence is supported by an atmosphere equilar to existrevolving round our sun have inhabitants, whose existence is supported by an atmosphere similar to our own. The varied distances of the planets from the sun, and the vast difference in the amount of heat received by each, present the greatest difficulties when we try to imagine the inhabitants of these far-off spheres. Neptune only receives \$\frac{1}{2}\sigma \text{That}\$ of the heat which we receive, while Mercury and Venus must receive much more than we do. However, it has been argued by scientific philosophers, that the diathermanous nature of the carth's atmosphere is such, that it regulates the amount of heat transmitted to us from it regulates the amount of heat transmitted to us from the sun; the temperature being in proportion to the the sun't the temperature being in proportion to the height of the timosphere. Similarly they argue, that according to the height or depth of the atmospheres surrounding the other planets, their mean temperature might be the same as our own. Mr. Hopkins, of Cambridge university, calculated, that if the planet Mars had an atmosphere of 15,000 feet higher than that of the earth, the average temperature would be similar to ours; and if the atmosphere of Venus was 20,000 feet less than that of the earth, the same effect would be produced. Schroeter calculated that the atmospheres of Ceres and Pallas were 668 and 465 miles, respectively, in height. (See PLANERS and RADIANT HEAT.)

ATMOSPHEBICAL CLOCK. (See CLOCK.) ATMOSPHERIC ELECTRICITY. (See ELECTRICITY, ATMOSPHERIC.)

ATMOSPHERIC.)

ATMOSPHERIC ENGINE, ill-mos-fer'-ik, an engine in which the piston is raised by the force of the steam which is admitted at the bottom of the cylinder. As soon as the piston reaches the top of the cylinder, which is open, the steam is condensed, and the piston is forced down by the pressure of the atmosphere. These engines are but rarely used in the present day.

ATMOSPHERIC RAILWAY.—Several plans have, at various times, been devised for producing locomotion by means of atmospheric pressure. Most of these.

by means of atmospheric pressure. Most of these, when brought into action, have been found to be commercial failures. The most successful of these Surg kemispheres, invented by Otto Guericke. This well-known arrangement consists of two hollow copper known arrangement consists of two hollow copper knispheres, of a to 42 inches diameter, the edges of years by Messrs. Clegg and Samuda, but eventually

abandoned in favour of steam. The line was very steep in some parts, and, one terminus being much higher than the other, the carriages performed the return journey by the force of their own gravity. The method of working was as follows:—A tube 15 inches in diameter was laid the whole length of the line. in diameter was faid the whole length of the line. Along the top of this tube was a slit covered by a flap of leather, strengthened by two pieces of iron. Within the tube was a piston, to the centre of which was fixed a piston-rod. To the end of this rod farthest from the piston was attached the connecting-bar of the carriage, which passed npwards through the slit in the tube. The flap being opened at a distance of say four fect from the piston, did not interfere with the air-tightness of the portion of the tube before the piston. To the connecting-bar of the carriage was fixed a little rollow which closed the flan as soon as the connecting-To the connecting-bar of the carriage was nice a little roller, which closed the flap as soon as the connecting-bar passed, and a heater at the same time glided over the flap, melting the composition of wax and tallow with which it was soaked, rendering the tube once more air-tight for another carriage. The piston was set in motion by exhausting the air before it with a powerful pump worked by a steam-engine. A line was also laid between London and Croydon; but it has and the week London and Croyon; but this been long abundoned. A scheme is alloat for the conveyance of parcels by atmospheric pressure. In this case, the tube is intact, and the box containing the articles to be forwarded is attached to the piston. The great objection to this mode of locomotion is the great objection to this inductor technical is see obvious waste of power, the same stationary engine being kept at full work whether the load is large or small. The liability of the flap or valve to get out of order was very great, a small stone or bit of stick falling into it during the passage of the train being enough to prevent a vacuum being formed when next required. The advantages, however, are also great. The impossibility of collisions, the ease with which The impossibility of commons, the case with which gradients are traversed, obvisting the necessity of cuttings or embankments, are benefits that are scarcely neutralized by the disadvantages stated.

ATMOSPHERIO STOMES. (See AEROLITES.)

ATOMIC TREORY, ATOMIC WEIGHT, intomicik (Gr.

a, not, temno, I cut) .- Every body is supposed to cona, not, cents, of turknown size, form, and weight, which being infinitely hard, cannot be further subdivided. The atoms of elements are simple, those of compounds are compound. No atom has ever been seen, even by the most powerful microscopes, although particles of the control of the contro bodies less than survey of an inch in diameter have been discerned by their sid; the forms of atoms are, therefore, unknown. Although the actual size and weight of the ultimate atoms of bodies cannot be ascertained, it is easy to discover their relative size and weight. For instance, it is found by experiment that weight. For instance, it is found by experiment that one grain of hydrogen combines with eighty grains of bromine to form a definite compound, and never in any other proportion; it is therefore supposed that the number of atoms of each body is the same, but that the weight of each atom is as I to 80. This is borne out by the fact that bromine is exactly 80 times as heavy as hydrogen, a cubic inch of one uniting with one cubic inch of the other. The numbers and 80, therefore, represent the weight of the atoms or the atomic weights of these bodies; and it follows that 81 is the atomic weight of the compound formed by their union. These numbers are also termed the chemical equivalent or combining proportion of these substances. All the other elements have their combining proportions or adomic weights, and are subject to the same laws as hydrogen and bromine. It often happens that double, troble, and quadruple atoms of one ele-ment will unite with a single atom of another element to form a compound; for instance, the following compounds of mitrogen and oxygen occur :-

> Nitrogen, 14 grains; Oxygen, 8 grains. 16 ... 2.7

24 14 22 ... 24 \*\* 32 40 14 99 14 83

Here we find one atom of nitrogen uniting with a single, double, treble, quadruple, and quintuple atomatoxygen, and merer in any other proportion,—N. 15 to O. 6, or N.14 to O. 7, for example. This is called the doctrine of defimite proportions, and is a consequence of the theory of

stoms of a constant size and weight laid down above. It was first put forth by John Dalton, of Manchester. It has been said above, that the atoms of the essue body are of constant size; but it happens in several sizes that the atoms of different bodies are of different sizes. Thus, though it is found that one cubic inch of hydrogen unites with one cubic inch of hydrogen unites with one cubic inch of hydrogen unites with one cubic inch of carbon and iron unite in chemical combination. There is great diversity in the relative sizes of elementary atoms, those of six in the relative sizes of elementary atoms. eity in the relative sizes of elementary atoms, those of carbon being only half the size of those of iron. The weight of an atom of carbon would be 6, and that of an atom of iron would be 28; but the quantity of carbon would only take up half the space of the quantity of iron. It has been found that bodies with the same of iron. It has been found that bodies with the same combining volume sures strongly in their properties. Iodine, chlorine, and bromine, are very similar in their reactions; and there are several other groups of elements formed on the same basis. (See Around Volume.) To sum up, atomic weight is the relative weight of the atoms of bodies, or, which is the same thing, the proportion in which they unite. Reasoning on this theory, tables have been constructed of the atomic weights of all the elements, the atomic weights of all the elements, the atomic weights atomic weights of all the elements, the atomic weights of compounds being evidently the sum of the stomic weights of their constituents. Hydrogen has been taken as the unitary body by English chamiets, from being the lightest of all known substances. The continental chemists have taken 100 parts of oxygen as the standard number. This latter arrangement, by increasing the figures in each number, renders it much ess convenient to work with the continental than with the English scale.

Those elements with no numbers against them are as yet too rare in their occurrence to have had their yet too fare in their occurrence to have nad their atomic weight properly investigated. The above numbers, or equivalents, as they are generally termed, for the sake of shortness, have been determined with almost mathematical accuracy by various chemists of celebrity. When once a standard was fixed on, it was easy to determine the equivalents of other elements, by uniting a definite portion of the standard substance with that whose equivalent was sought, and weighing the result. Thus, I grain of hydrogen was exploded the result. Thus, I grain of hydrogen was exploded with, say, 13 of oxygen. A certain portion of the oxygen united with the hydrogen to form water, another portion remaining uncombined. On weighing the water, it was found to weigh 9 grains, showing that the equivalent or combining proportion of oxygen was 8, which was further confirmed on weighing the uncombined oxygen. Analysis, as well as synthesis, was also used to determine or confirm equivalents. One also used to determine or confirm equivalents. hundred grains of water were decomposed by voltaic electricity, and the resulting ovrgen and hydrogen weighed, the amounts being found to be, hydrogen 11·111 grains, oxygen 88'889 grains. The accuracy necessary in these determinations is so great, that the most eminent chemists shrink from engaging in these researches, although there are several elements.—

most eminent chemists shrink from engaging in these researches, although there are several elements,—boron, for instance,—the equivalents of which are acknowledged to be not quite correct.

ATOMIC VOLUME.—Atomic volume is the relative size of the combining proportions or atoms of bodies, just as atomic weight is the relative weight of their combining proportions or atoms. It is determined by dividing the atomic weight by the specific gravity. As the principal researches on atomic weights have been made in Germany, the oxygen standard is generally used in calculating them. As before stated (Atomic Weights), substances fall into several well-marked groups, possessing analogous properties, and giving groups, possessing analogous properties, and giving groups, possessing analogous properties, and giving isomorphous compounds. The following table will be sufficient to show this fact:—

	Equiv. 0 = 100	Atom. vol.	Sp. Gr.
Cobalt	369	44	8.39
Iron	350	44	7.95
Nickel	369	44	8.39
Iridium	1232	57	21.6
Osminm		57	21.8
Platinum	1232	57	21.6
Gold	2458	128	19.2
Silver	1350	128	10.53
Tellurium	800	128	6.25
Bromine	1000	320	3.12
Chlorine	443	320	1.38
Iodine	1587	320	4.95

It has been shown by Kopp that those elements which are isomorphous possess the same atomic size. This is true of numerous isomorphous compounds. Sulphate of magnesia and sulphate of zinc crystallize in the same forms, and have the same atomic size, although the atomic size of magnesium and zinc are different. The mysterious relations existing between the atomic volumes of different compounds and elements has lately received particular attention from many eminent chemists, great light having been thrown on the subject but the standard of the s by the researches of Kopp, Schröder, Felhol, Playfair, and Jonie.

ATONEMENT, a-tone'-ment, is a term derived from the old English verb to atone, ...e., to reconcile; and hence atonement, ...e., at-one-ment, ... denotes the being reconciled or agreed. In Theol. it is the reconcile-160

# Atropaces

ment of God with man, by virtue of the death of Christ. According to the Articles of the Church, the Son, one in substance with the Father, took upon him the nature of man, becoming very God and very man, "truly suffered, was crucified, dead, and hurled, to reconcile his Father to us, and to be a sacrifiee, not only for original guilt, but also for actual sins of men." Neither the nature nor limits of the present work admit of our neiting the different views that have been held by divines on this subject, or the numerous linely-spun theories to which it has given rise. They are wiser who hold with Bishop Butler, when speaking of the efficacy of Christ's sacrifice to secure the pardon of sin, says,—"How and in what particular way it of sin, says,—"How and in what particular way it had this efficacy there are not wanting persons who have endeavoured to explain; but I do not find that Scripture has explained it."

ATONY, at-o-ne (Gr. a, not, and tonos), tone), is a term used in Med. to denote deficiency in power or

term used in sted to denote demonery in power or tone, generally applied to muscular power.

ATRIP. (See ANCHOR.)

ATRIUM, ai'-tri-um (Gr. aithrios, exposed to the air), the entrance-hall and most splendid apartment of a Roman house. It consisted of a large covered court, with an opening in the centre of the roof, termed the complavium, through which the rain-water descended into a cistern let into the floor beneath. It was the into a clatery let into the noor beneath. It was the most highly decorated spartment in the whole house. Upon the walls were drawings representing incidents from the sacient mythology, surrounded by borders formed of elegant arabesques. Even the floors were frequently enriched with pictures executed in mosnic. The owner of the house have received his mounting The owner of the house here received his morning visitors; here the mistress superintended the labours of her female slaves, whilstengaged in weaving or other occupations. The temples, also, had atria, where the senators and others sometimes held meetings.

(See HOUSE, ROMAN).

ATROPA, ā-tro'-pā (Gr. Atropos, the name of one of the Fates), in Bot., a gen. of plants, formerly included in the ord. Solunacea, but now regarded as the typical in the ord. Solunacea, but now regarded as the typical gen. of a nat. ord. to which the name Atropacea has been given. The most important species is A. belladonna, the common Dwale, or Deadly Nightshade. This plant is a native of Greece and Italy, and also indigenous to Britain, but not common. It is perential and groups in bedges and waste grounds on a indigenous to Britain, but not common. It is perennial, and grows in hedges and waste grounds on a calcareous soil, but is only net with in a comparatively few localities. It blossoms from June to August, the flowers being about an inch long, drooping, bell-shaped, and of a lurid purple colour. The fruit is a berry of a shining volet black colour when ripe, about the size of a small cherry. The berries have a most tempting appearance, and children have frequently been poisoned by them. They are nowefully reproting been poisoued by them. They are powerfully narcotte; and one of the first symptoms of their deadly action and one of the first symptoms of their veant actions on the human frame is an appearance of the most besotted drunkerness. The dried leaves, or an infusion of the leaves, will act in a similar manner. Even a small dose causes an extravagant delirium, which is usually of an agreeable character. The delivium is sometimes accompanied by excessive and uncontrol-lable laughter, sometimes by excessive talking, but occasionally by a complete loss of voice. The state of mind sometimes resembles somnambulism, as in the case of a tailor, who, for fifteen hours, was speechless and insensible to external objects, and yet went through all the operations of his trade with great vivacity, and moved his lips as if in conversation. The best antidot to the virulent effects of this poison is vinegar, when promptly administered; but, if practicable, the stomach-pump should be at once used. When death ensues from its effects, the body soon putrefies, and swells in a remarkable manner, being covered with livid spots; and blood sometimes exudes from the mouth, nose, and eyes. Extract of bellacase of a tailor, who, for fifteen hours, was speechless from the mouth, nose, and eyes. Extract of bella-doma is employed to dilate the pupil of the eye during surgical operations, to allay pain and nervous irritation, and as an antispasmodio. It is to be feared that it is a common ingredient in specifics for sparkling eyes sold by perfumers. The active principle of the plant is the alkaloid atropia.

ATEORACEE, &-tro-pay-se-e, in Hot., a nat. ord. of dicotyledonous plants, of the sub-class Corollifore. The thirty-eight genera included in this order were

## Atrophy

separated by Miere from the Solonaces and Screphulariaces. The species are very numerous, and abound in tropical regions; but some are found in most parts of the world. Many have powerful narrotte parts of the world. Many have powerful narrotte properties, as, for instance, the tobacco-plant, the thornapple, heubane, deadly nightshade, and the mandrake, (See NICOTIANA, DATUBA, HYOSCYAMUS, ATEOPA, and

MANDHAGORA.)

MANDRAGUAL.
ARBORHY, at roofs (Gr. a, not, and tropks, nourishment), in Med., denotes a wasting, from deficient nutriment, either of a part or of the whole body.
In order to the maintenance of the healthy state of In order to the maintenance of the healthy state of the body or of any of its organs, a certain supply of nutrition is required to meet the waste that is constantly going on. When, from any cause, the supply of nutrition is not able to meet this waste, the natural dimensions of those parts are reduced. In a healthy condition of body, an exact balance is maintained between the waste and the supply; but in every morbid accidition this belience is more or less disturbed, in between the waste and the supply; Dut in every mod, in condition this balance is more or less disturbed, in consequence of which the whole body, or certain parts of it, receive too little or too much nourishment. first state, from whatever cause it arises, is termed atrophy, the latter hypertrophy. Atrophy may thus arise from a rast variety of causes. It may be occasioned by merely withholding the necessary supply of nutritions food, without any actual disease. Among the diseases capable of producing atrophy, the most common are those of the digestive organs, by which the aliment is taken up and prepared for assimilation.

Disease of the organs of assimilation may produce atrophy as effectually as disease in the primary organs of digestion. A frequent instance of this is in consumption, when the lungs become so diseased as not to be able to receive a sufficient quantity of air. Atrophy may result also from a want of activity in an organ, or in the whole body; so that when the nutri-tive particles are conveyed to them in the blood, they have not power to appropriate a sufficient quantity of them. When the vital activity of an organ is small, the them. When the vital activity of an organ is small, the nutritive particles are taken up slowly and languidly; while the affinity existing between them being also weak, they are sooner removed by the process of sborption than in health, and the parts thus circumstanced are rapidly wasted. Hence a due supply of nervous stimulus is necessary to the vital activity of an organ; while the cessation of action in any organ is invariably followed by atrophy. The first change that takes place in an atrophical organ from whethere. that takes place in an atrophied organ, from whatever cause, is diminution of the quantity of blood sent to cause, is diminution of the quantity of blood sent to it; and next to this, and chiefly owing to it, is greater paleness of colour. Subsequently, the organization becomes more completely changed; so that frequently all traces of its original conformation are lost, and, in some cases, it at last disappears altogether. In all cases atrophy arises from the diminution or perversion of the vital energies, generally the former; and hence, by exciting the natural vital energies of an organ, we tend to remove atrophy. In order to its cure, it is necessary to discover in what organ or organs the deficiency or perversion exists. The discovery of this is often difficult, and the removal of it, when discovered, is often more difficult. is often more difficult.

ATROFIA, ATROFINE, d-tro'-pi-n, a vegetable alka-loid found in the deadly nightehade (Atropa bella-donna), and the seeds of the Datura Stramonium. It donna), and the seeds of the Datura Stramonium. It is extracted by adding sulphuric acid to a strong decoction of either plant; filtering, saturating with potash, and dissolving the precipitate, which is the atropia, in hot water, from which it crystallizes in long silky needles. The preparation of the alkaloid causes a peculiar dilatation of the pupils of the eyes, which continues for several hours. It is one of the most violent aerid poisons known, the only antidote being a vigorous and immediate application of the stomachnumn, ametics being utterly useless, from the paralyzed

### Attainder

issues at the discretion of the judges of a court of record against a person, for some contempt, either actual or by disobeying its order, for which he is committed. It may be awarded by them upon a bare suggestion, or on their own knowledge, without any appeal, indictment, or information. The cases in which it is issued are where witnesses do not appear on a subpossa to attend a court, or on an order before an arbitrator, or refuse to be sworn and examined, or prevaricate in their evidence; for non-observance of prevarioate in their evidence; for non-observance of an award duly made; for non-payment of moneys, or neglect or refusal to perform an act pursuant to an order; unduly perverting the proceedings of the court; writing privately to a judge on a case in court; or for doing any act derogatory to the authority of the court or the respect due to it. Foreign attachment is a process peculiar to the city of London and some other places, issued out of the lord mayor's or sheriff's court, in the nature of a notice to a person who has moneys or effects in his hands belonging to a debtor, not to part with them without license from the court. This person is called the garnishes. It has been considered that the lord mayor's court has jurisdiction sidered that the lord mayor's court has jurisdiction over the garmshee if he can be served with the notice over the garmanee it he can be served with the notice within the city, although he has no residence or office within the city, and the goods or moneys are not in the city; but this question is now before the court of Queen's Beach, which has not yet delivered its judgment. Unless the debtor settle the demand, or he or the garnishee successfully defend the action, the plaintiff recovers judgment against the garnishee to the extent of the assets in his hands for the amount of his claim. If the action be not defended, the claimant must give a bond to return the value of what he recovers from the garnishee, if the debtor should come in within a year and a day, and defend the action and recover judgment.

ATTACK, di-tak', in Mil. Lan., denotes an advance upon an enemy, with a view of driving him from his position. It may be made either upon an adverse army in the field, or upon a fortress. In every age, possion. It may be made either upon an adverse army in the field, or upon a fortress. In every age, the most experienced generals have generally preferred making an attack, to protracting the war by tedious and indecisive manouvres, which harass and dispirit their troops. The army making the attack, especially if unexpected, possesses manifest advantages over the enemy, which generally more than counterbalance even very considerable advantages on the other side. Hence, an experienced general always chooses, it possible, to keep his enemy on the defensive. The nature of the attack depends upon the condition and position of the enemy, upon the condition and position of the enemy, upon the condition and position of the enemy, upon the craiming a consequence when craiming from Lat. tangere, to touch, catch, or take, or tingere, to stain, to impute, charge, or accuse), in Law, is the immediate consequence when sentence of death is pronounced. The criminal is then called attaint,

immediate consequence when sentence of death is pronounced. The criminal is then called attaint, attinctus, stained, or blackened. He is no longer of any credit or reputation; he cannot be a witness in any court; neither is he capable of performing the functions of another man; for, by an anticipation of his punishment, he is already dead in law. It is often confounded with conviction; but a man may be convicted, and not receive indrament for a time, or the victed, and not receive judgment for a time, or the conviction may be erroneous. To be attainted, he must have judgment of death. A person attainted of must have judgment of death. A person attainted of high treason forfeits all his lands, tenements, and hereditaments; his blood is corrupted, and he and his posterity were formerly rendered base; but by 54 Geo. III. c. 148, 3 & 4 Will. IV. c. 108, and 4 & 5 Will. IV. c. 23, the former rigour of the law was modified. By the first act, except for treason or felony, the attainder will affect only the offender for his natural life, and will not extend to disinherit or prejudice the right of title of any other persons after his pump, emetios being utterly useless, from the paralyzed good on the stomach.

ATTACHÉ, di-tibbh-di (Fr., attached), in Dipl., is a name given to certain young gentlemen who are attached to embassies in the capacity of assistants, with a view to their being made familiar with the duties of the office, in order to their afterwards holding appointments in that department of the public service.

ATTACHMENT, di-tachi-ment (Fr. attacher, to attacher will not affect land, chattels,

or stock vested in any person attainted, upon any trust, or by way of mortgage, or any profits thereof. Persons may be attainted by ant of partisament. The attainter may be reversed or falsified by writ of error or by plea. If by writ of error, the consent of the crown to the writ must be obtained; and when by plos, it may be by danying the treason, pleading a pardon by act of parliament, &c.

ATTAMA, &-tai-M-d, in Bot., a gen. of palms com-prising numerous species, nearly all natives of the tro-pical parts of America. They have in general tall and smooth cylindrical stems; but a few species are stemsmooth evindrical stems; but a few species are stem-less. The leaves are large and pinnate; the fruit a nut, with three seeds and three cells, inclosed in a dry husk. The species A. funifera is the most important member of the group. The fruits constitute the Co-quills nuts of commerce, which are largely imported into this country. The pericarp of this fruit is very hard, and forms a kind of vegetable ivory, adapted for han dless of doors, drawers, walking-sticks, and umbrellas. The pendulous fibres of the leaf-stalks are much used for cordage, the ropes made from them being very strong, and extremely durable in salt-water. The fibre resembles piassabs very closely; and, in fact, until quite recently, the two kinds of fibre were thought to be identical. (See Leofoldinia, the Piassabs palm.) From the seeds of A. Cahomi a fatty oil may be ob-tained. A. compta, the Pindova palm, produces a fruit about the size of a gooso's egg, the kernels of which are estable.

ATTLE, or OTTO, OF ROSES, ål'-tar, an essential oil obtained from the petals of three species of rose,—namely, Rosa centifolia, moschata, and damascena. The rose-gardens at Ghazcepore have long been famed for the production of the precious liquid. These gardens are large fields, planted with rows of small rose-bushes. The blossoms, which unfold in the morning, bushes. The blossoms, which unfold in the morning, are all gathered before noon; and their petals are at once transferred to clay stills, and distilled with twice their weight of water. The rose-water which comes over is placed in shallow vessels covered with moist muslin, to exclude dust, and exposed all night to the cool air. In the morning the thin film of oil which has collected on the top is carefully swept off with a feather and transferred to a small phial. This process is repeated morning after morning, till nearly the whole of the oil is separated from the water. Heber says that about 20,000 roses are required to yield a rupee weight (176 grains) of attar; and this quantity is worth £10. (176 grains) of attar; and this quantity is worth £10. Attar of roses is imported from Smyrna and Constantinople; but it rarely, if ever, arrives in this country pure. It is commonly adulterated with spermaceti and a volatile oil, which appears to be derived from one or more species of Andropagon (see this word), and which is called in London oil of ginger-grass, or oil of gera-

ATTENTION, at-ten'-shon (Lat. attentio, from ad, to, and tendo, I stretch), is a term used in Mental Phil, to denote a steady exertion or due application of the mind to any object of sense or intellect, in order to its being thoroughly understood, and afterwards remembered. When we see, hear, or think of anything, and feel a desire to know more of it, we attempt to keep the mind fixed upon it; and this fixing of the mind is call d attention In other words, it is that effort of the mind to keep before it an idea or perception, and to ex lude for the time all other objects that solicit its notice. According time all other objects that solicit its notice. According to Stewart, it is a distinct faculty of the mind; and, though this view does not seem to be the correct one, yet his remarks on this subject are acute and valuable. Bir William Hamilton combats this opinio, and maintains that attention is not a special faculty of the mind, but only "consciousness concentrated." "It is," be says, "consciousness applied by an act of will or de-sire ander a perticular law." This law is terms the law of limitations, which is "that the intension of our knowledge is in the adverse ratio of its evtension: in other words, that the fewer objects we consider at once, the clearer and more distinct will be our know-ledge of them." The greater the number of objects to which the mind is at the same time directed, the smaller is the intensity with which it is ably to consider each, and, consequently, the less vivid and distinct will be the information it obtains regarding them. Though attention is generally, yet is not always, a voluntary Action

act; for sometimes it is seized upon and fixed by an object of interest beyond the power of control. According to Sir W. Hamilton, there are three degrees or kinds of attention,—"the first, a mare vital and irresistible act; the second, an act determined by desire, which, though involuntary, may be resisted by ur will; and the third, an act determined by deliberate volition." Considered in its highest degree as an act of the will, the power of concentrating attention is of the utmost importance. Every idea is vivid in proportion to the degree of attention that is given to it; and it is only by the attention that is given to it; and it is only by the attention that is given to one object that we can form a distinct notion of it, or discover its nature, attributes, or relations. It is also one of the greatest aids to memory, to which it seems to be greatest aids to memory, to which it seems to be essential that the perception or idea which we wish to remember should remain in the mind for a certain space of time, and be exclusively contemplated by it. One may obtain the same command over his mind that he has over the muscles of his body, and may learn to be attentive as he learns to walk or to write. The stronger one's power of attention, the longer and more steadily will he be able to follow out the same train of thought, and the greater will be the success attending his labours. "Genius," says Helvetius, "is nothing says Helvetius, "is nothing on;" and Sir Isaac Newton, but a continued attention; and Sir Isaac Newton, when complimented upon his great discoveries, remarked, "that if he had made any improvements in those sciences, it was owing more to patient attention than to any other talent."

than to any other talent."

ATTHRITON, a cautionary word used in the British military service as preparatory to any particular exercise or manœuvre: gara-a-rous has the same signification in the French service. Upon receiving this command, the infantry soldier, whether of the line, volunteers, or militis, assumes the following position:—Shoulders square to the front; heels kept together; the start transfer contract of the first forming an angle of sixty. Shoulders square to the front; need sope sogether; toos turned outward; feet forming an angle of sixty degrees; arms depending straight from the shoulders; palms of the hands falling flat upon the thighs; body straight, but with a trilling inclination forward, in order that its weight may principally fall upon the fore part of the feet; head kept erect, but without being thrown back; eyes looking straight to the front; the whole position being perfectly easy and uncon-strained, without any rigidity or awkwardness.

ATTENUANTS, dt-ten'u-ants (Lat. attenuo, I make thin), in Med., a term applied to those remedies which, it is supposed, have the power to impart to the blood a thinner or more fluid consistence.

ATTENUATED, ăl-ten'-u-ai-ted (Lat. attenuo, I make

thin), in Bot., tar-ring gradually to a point.

ATTENUATION, at-ten-u-ai'-shun, is a term employed
by distillers and brewers to denote the weakening of saccharine worts, by the conversion of the sugar into carbonic acid and alcohol, during the process of fer-

ATTESTATION, at-tes-tail-shon (Lat. attestor, from ad, and testor, I call to witness), of a deed, will, or other instrument, is the execution of it in the presence of witnesses, who indorse or subscribe their names under a memorandum, to the effect that it was signed or executed in their presence. In general, one witness is sufficient to attest a deed or other legal instrument; but if it be executed in pursuance of a power which directs it to be done in the presence of a given number of witnesses, it will be void unless it be attested by such number. The execution or acknowledgment of a will must be attested by at least two witnesses, who must both or all be present at the time of the execution or acknowledgment of it by the testator, and must subscribe their names as witnesses thereto in his presence, and in the presence of each other.

sence, and in the presence of each other.

Arric, iti-tik (Gr. attikos, belonging to Attica), a term in Arch., applied to a low parapet-wall surrounding the top of a building, and placed on the entablature. It in generally plain, but sometimes broken with pilasters, before which figures in high relief are placed, as in the Arch of Constautine. It was intended to conceal the roof, and give a more imposing appearance to the building. In ancient architecture its height varied greatly, but in modern times it is generally made equal to that of the entablature. In Building, the term is annied to rooms made in the roof Building, the term is applied to rooms made in the roof of a house. An attic base, in Arch., is that which

consists of an upper and lower toque, separated by a scotia and fillets, measuring in height one-third the course and mess, researched in angle of the column it supports. It is commonly applied, now, to the rooms built in the roof of modern dwellings. The expression is also variously employed in other ways. Thus, sharp and subtle wit is often called Attic seasoning or sait; a witness that is incorruptible, an Attic witness.
ATTIC DIALECT, THE, is that dialect of the Greek

ATTO DIALECT, THE, IS thus charges of the Green language which was spoken in Attics. It was the most refined and polished of all the dialects of ancient Greece; and is it woote Solon the lawgiver, Thucydides and Xenophon the historians, Aristophanes the comic poet, Plato and Aristotle the philosophers, and De-monthenes the orator. When, after the Macedonian conquest, Greek became the language of literature and diplomacy in mest parts of the civilized world, the Atticame to be that dislect of the Greek which was generally adopted.

ATTITUDE, dt'-ti-tude, in Paint. and Sculp., the posi-tion and gesture of a figure, by which the sentiment or passion of the person represented is denoted. At-titude is to the limbs the same as expression to the features, and should be natural, unconstrained, and varied. In a group of figures, the attitudes should be contrastive, and so composed as to balance and set off

each other.

ATTORNEY, dt-tur'-ne (Lat. attornatus, ad, torno, and Fr. attourner, to turn), is one man set in the place of another, and who has authority given to him to act in the stead and place of him by whom he is delegated, in private contracts, agreements, and other matters of business. His authority must be by deed, which is called a letter or power of attorney, which requires a

stamp of 30s. (See AGENT.)

ATTORNEY-AT-LAW answers to the proctor of the civilians. Formerly, every suitor (as now the defendant in criminal cases) was obliged to appear in person. To remedy this inconvenience, and to regulate the admission and government of attorneys, several statutes have from time to time been passed, the first of which was the statute of Westminster, the 2nd, c. 10 (temp. Edward I.). The following will apply as well to a solicitor as an attorncy. He must be articled, and serve his articles, for a term which has been fixed as follows:-One who has taken a degree (specified in 23 & 24 Vict. c. 127) at a university, or been called to the bar, or been for ten years a bond fide clerk to an be sor, or been for ten years a companie there to an attorney, three years; in other cases, five. He must be sworn to demean himself honestly; be admitted and eurolled, and take out an annual certificate, without which he cannot duly practise nor recover his fees. Before admission, he must pass an examination, to show he is qualified. No action can be commenced for his fees until one month after his bill, signed by him, or his executor, administrator, or assignee, or, in the case of a partnership, by any of the partners, either with his own name or the name or style of the partnership, be delivered to the party to be charged partnership, be delivered to the party to be charged therewith, or sent by the post to, or left for him at his counting-house, office of business, dwelling-house, or last known phase of abode, or be inclosed in or accom-panied by a letter, sigued in like manner, referring to such bill. His bill is subject to deduction or taxation by an officer of the court; and it is be taxed by the client, and more than one-sixth be taken off, the attorney is liable to pay the costs attendant on the taxation. Being ano finer of the court, he is amenable to it for any malfearance or misappropriation of moneys or securities, or for improper conduct in his character of attorney; and the court may order payment or restitution, or fine, or commit him for contempt, suspend to the court may order payment or restitution, or fine, or commit him for contempt, suspend to the court may be the first first wolls of the him from practising, or strike him off the rolls of the court. In the last two cases, the other courts in which he has been admitted will deal with him in a similar If he be convicted of any offence, although not in his character of an attorney, which would materially affect his standing or position in society, the courts would also strike him off the rolls. Neither an idiot, a married woman, nor an infant, can appoint an

ATTORNEY-GENERAL, a great law officer of the crown, whose business is to exhibit informations, and prosecute for the crown in matters criminal, and institute suits in the Exchequer for anything concerning

the queen in inheritance or profite. His proper place is sourt, upon any special matters of a criminal sparre wherein his attendances required, is under the judges, on the left hand of the clerk of the arrows; but this is on the sets mand of the carry of the grown; but mas seemed, upon seleme and extraordinary occasions; for usually he does not sit there, but within the bar; in the face of the court. The queen-conset is also privileged to have an attorney-general.

ATTORNEY OF THE DUCHY COURT OF LARCASSEES is

the second officer in that court, placed as assessor to

the chancellor of the court.
ATTOERNERT, di-turn'-ment (Lat. attern ATTORNMENT, means the state of the state of professing or agreeing to become tenant to a new landlord, on the alienation of property, or on its being recovered in an action of ejectment. In the

being recovered in an action of ejectment. In the latter case, the attornment is to prevent the necessity of the tenant being actually turned out of peasession, under the process, to give possession to the plaintiff, by virtue of the judgment in the action.

ATTRIBUTE, id-tri-bute (Lat. attribute, from ad, to, and tribuo, I give or bestow), is properly a quality or property ascribed to or belonging to a person or thing. Of the several attributes belonging to any substance, some are termed essential,—those that are necessary to it, and go to form its character, as expectation and attraction to matter; others are termed essential. tension and attraction to matter; others are termed accidental, as roundness in wood, or learning in a man. In Theol., it denotes the several qualities and perfec-In Theol., it denotes the several qualities and perfections which we conceive in God, and which constitute his proper essence; as justice, goddness, truth, wisdom, &c. Some distinguish them into negative, and positive or affirmative; the former being such as remove him from whatever is imperfect in the creature, as infinity, immutability, immortality; the latter being such as assert some perfection in him, which is in and of himself, and which, in the creature, in any measure, is from him: as coodness, holiness, wisdom. Others divide sell, and which, it the cressure, in any messure, is from bim; as goodness, boliness, wisdom. Others divide them into absolute and relative, or into communicable and incommunicable.—In Log., the attributes are the predicates of any subject, or what may be affirmed or

denied of anything.

ATRIBUTES, di-tri-butes (Lat. ad, to, and tribuo, I give), a term used in the Fine Arts, to signify certain symbols which accompany, distinguish, and characterize certain figures and allegories. Thus, the eagle and thunderbolt are the attributes of Jupiter; the caduceus is the attribute of Mercury; the trident of Neptune. Love is always represented with a bow and quiver; Justice with a balance and sword, &c.

and quiver; Justice with a balance and sword, &c. ATTRIBUTIVES, id-trib'u-tive, in Gram, are words which are significant of attributes; as adjectives, verbs, and participles, which are attributes of substances, and adverbs, which denote the attributes only of attributes. Mr. Harris calls the former attributives of the first order; the latter attributives of the second order.

ATTRITION, at - trish' - on (Lat. attritus, worn or rubbed down), in Geol., the wearing and smoothing of rock-surfaces by the passage of water charged with gritty particles, by the descent of glaciers, or by the passage of sand-drift.

passage of sand-drift.

ATWOOD'S MACHINE. (See GRAVITATION.)

AUCKLANDIA, asch-länd'-i-d, in Bot., a gen. of plants belonging to the next ord. Composite. The most interesting species is A. costus, a native of Cashmere, the root of which is supposed to have constituted the costus of the ancients. This root is commonly known in the north-western parts of India by the name of orrisarout. It must with however he confounded with orris-root. It must not, however, be confounded with the true orris-root, which is furnished by a plant be-

the true orris-root, which is furmished by a plant be-longing to a very different order. (See Int.). AUCTION, auk'-show (Lat. augeo, auction; Gr. auxo, increase; Lat. auctio, an increasing), a method of sell-ing property by competition. Sales by anotion are con-ducted on different principles, according to the outsom affecting particular trades, localities, or effects. The most general mode is for a professional map, called an auctioner, to offer the property for sale to persons most general mode is for a professional man, called an auctioneer, to offer the praperty for sale to persons assembled together by advartisement, who compete for the purchase by biddings, or offers of sums of money; and the person who bids last, or the highest amount, is declared the purchaser. Sales of this nature are governed by conditions which bind both the seller and purchaser. A bidder may retract his

bidding before the fall of the hammer. If a person by any means prevent other persons from bidding against him, he cannot compel the delivery of the lot, although he may have said a deposit. If a vendor employ agents at a sule, to bid salely for the purpose of exciting compellines, and without any intention of purchasing, he must amounce it, or the sais is void if any which or fraudulent misrepresentation of the property or contrel put up for sale be made, either in the description or otherwise, the purchaser is not bound to complete the sale, and he can compel a return by the auctioner of the purchase or deposit money, or such part of, it as will make up the deficiency in value. In a Butch auction, the auctioneer commences by naming a high price, and gradually reduces it until some person closes with his offer. In some cases, auction sales, or biddings, are effected by a minute guishment of the light, is declared the purchaser.

Auction sales, or biddings, and the bidder immediately preceding the running out of the sand, or the extinguishment of the light, is declared the purchaser.

Auction sale before a bidding is made. He is the agent both of the vendor and purchaser, and, as such, may bind both. He is entitled to hold the purchase or deposit money as stakeholder for both parties, until the contract he completed, without paying interest

may bind both. He is entitled to hold the purchase or deposit money as stakeholder for both parties, until the contract be completed, without paying interest for it, and he is personally liable to the purchaser if he pay it to the vendor before completion. If both parties set up a title to the deposit, he can compel them to interpleed to establish the right. He has a special property in goods sold, and may maintain an action against the purchaser for the price. If he sell without declaring who is his principal, the purchaser can compel him to complete the contract.

Aucuia, 'ac-bu'-bû, in Bot., a gen. of plants belonging to the nat. ord. Cornaces. The only known species is A. feponica, which, as its name implies, is a native of Japan. It was introduced into Britain as a hothouse plant, but was soon found to be hardy enough

is a repositor, which, as its means implies, is a factor of Japan. It was introduced into Britain as a hothouse plant, but was soon found to be hardy enough to flourish in exposed aitastions. It is now a very common ornamental shrub, especially in the parks and suburban gardens of large towns. It is remarkable for its shining pale-green leaves mottled with yellow, which have obtained for it the common name of Variegated Laurel. The plant is diocious, that is to say, the male and female flowers are produced by separate individuals. The female plant is alone known in this country; hence it never yields seed, and can only be propagated by layering, or by slips or outtings. ADDIENCE, as deficient (Lat. addio, I hear), denotes the attention that is given to a person while speaking, or persons listening to a public speaker, singer, or other performer. The ceremony of the admission of ambassadors or public ministers to a king to deliver the oredentials of their sovereign is likewise called an undience. In History it is the name of certain tribu-

audience. In History it is the name of certain tribu-nals or courts of justice established by the Spaniards

in America.

Auditor (Lat. audio, I hear), in a general scase, one who listens or attends to anything; in English Law, an officer of the crown or some great person who makes a yearly examination of the accounts of the under-officers. Receivers-general of fee-farm rents are called anditors. The auditors of the imprest were are caused anattors. The auditors of the impress were officers of the Exchequer appointed to take the accounts of the receivers of public revenues. The present Board of Commissioners, exercising the duties formerly divided between various departments of the Exchequer, was constituted in 1806. In France, the members of the Chambre des Comptes were divided into conseillers. matters and conscillers auditeurs. In Com, auditors are persons appointed to examine, vouch, and certify the correctness of the accounts of a public company

or body.

AUDITORY, aw'-di-to-re, in Anat., is a term applied to certain parts of the organs of hearing; as the auditory nerse, meature auditorius, &c. (See Ear.)

AUDITORY (Lat. auditorium, an audience), an assemblage of persons gathered together for the purpose of hearing a preacher, lecturer, &c. In the ancient churches, the term auditory, or auditorium, was applied to that part of the building where the people stood to be instructed, and hear the Gospel: it is now called the nave.

Augaburg Confession

Avers, aw'-ow' (Du. cregary, Sax. sane-ger), an instrancest used for boring large holes by carpenter, wheelwrights, shipwrights, and others. It consists of an iron blade, terminating in a steel bit, with a handle placed at sight angles with the blade. When the suger has a straight chaunel or groove, it is somatimes called a "pod amper;" when it has a spiral charact, it is termed a "screw gager." A large kind of suger is used in agriculture for boring the earth in order to excertain the nature of the subsoil, minerals, or whether water is existing in a certain place.

Avers, aw'-jits, a species of horablende, known also as pyrozene. It is found in many volcanic rocks, such as basalt and porphyry, and consists of silicate of lime and magnesia. It is greenish-black or entirely black, and is generally more or less translucest, according to the amount of magnesses and irva contained in it. It crystallizes in hexagonal prisma, ter-

according to the amount of manganess and jr.ta contained in it. It orystallizes in hexagonal prisms, terminated by dibedral summits. A transparent green variety found in the Tyrol is used in jewellery. Havy gave it the name of pyrozens.

AUGMENTATION, COURT OF. (See COURTS.)
AUGMENTATION, COURT OF. (See COURTS.)
AUGMURG CONFESSION, ouggs-boorg, in Eccl. Hist.,
is the name given to that important profession of faith
of the Lutheran church which was laid before the
great diet of Augsburg in 1830. The emperor Charles V.,
is couldn't having about the manifest of the county in order to bring about an amicable settlement of the religious differences that were then existing in Germany, summoned a diet of the empire to meet at Augaburg, and requested the Protestants to bring before it a short summary of those doctrines in which they differed from the church of Pages. better it a snort summary of those accurace in which they differed from the church of Rome. John, elector of Saxony, therefore applied to his Wittenberg theologians, at whose head was Luther, to draw up articles of their faith, and to lay them before him at Torgau. These Torgau articles formed the basis of the Augsburg These Torgau articles formed the basis of the Augsburg Confession, which was drawn up at Angsburg, by Melancthon, assisted by other distinguished theologians, and approved of by Luther, who, however, could not appear at Angsburg, but remained at Coburg, not far distant, being under the ban of the empire. It is characterized by the clear methodical style of Melancthon, as well as by that gentle conciliatory spirit for which he was distinguished. His evident intention was to approximate as much as possible to the doctrines of the church of Rome, defining, at considerable length the heretical errors which they both siderable length, the heretical evrors which they both agreed in rejecting, and moderating, as much as pos-sible, the points of difference between them. He sought to establish the doctrines of Protestantism, sought to establish the doctrines of Protestantism, not only on the authority of Scripture, but also on that of the Fathers, especially Augustine, from whom the Romanists could hardly dissent, and who could not be accused of heresy. It consists of twenty-eight articles, twenty-one of which state the principles of their belief as regards faith and doctrine; the remaining seven treat at some length of those points in which they differ from the church of Rome. The following are the subjects of the several articles:—1. Of God: they differ from the church of Rome. The following are the subjects of the several articles:—1. Of God: 2. of original sin; 3. of the person and mediation of Christ; 4. justification; 5. preaching and the sacraments; 6. faith; 7 and 8. the Church; 9. baptism; 10. the Lord's Supper; 11. confession; 12. repentance; 13. the use of sacraments; 14. church government; 15. rites of human institution to be observed; 18. secular occupations; 17. Christ's second coming; 18. free will; 19. God not the author of sin; 20. faith and good works; 21. saints to be respected. not workers. secular occupations; 17. Christ's second coming; 18. free will; 19. God not the author of sin; 20. faith and good works; 21. saints to be respected, not worshipped. The abuses that had crept into the Church were—22. Depying the sacramental cup to the lastry; 23. imposing calibacy on the clergy; 24. of the mass; 25. of confession; 26. of fasts and other ceremonics of human invention; 27. of conventual vows; 28. of civil and ecclesiastical power. Its authors evidently had no intention of making it a permanent or immutable standard of faith, but simply gave it out at a statement of the beief then held. "Our churckes teach," "it is taught," "it is unanimously taught," "such and such opinions are falsely imputed to us," are the expressions used. These articles were read before the diet on the 25th of June, 1530. The papal theologians, headed by Faber, wrots a confustation of the Confession, which was also read before the diet, in the month of August of the same year. Melanothou answered it in his "Apology for the Augsburg Con-

### Augunie

lession," which was pr the other Swiss and P published in 1556. The alterations which he then made on the tenth actions, with a rice to unite the Luthersus and Calvinite, gase rice to much controvery; the Luthersus repudiating the alterations, and holding by the uniteract Confession; while the reformed churches accepted the altered one.

Augustis, as one research and announcements made by the Bonan segues, and which constituted their supposed science and inspiration. Public anguries were, —1. Appearances in the heavens, as thunder and lightning. The sugar marked the place where the flash of lightning originated, and where it disappeared. He stood on an elevated place, where he had a full wiew of all ground him. After the sacrifices had been made, and solemn prayers offered, he took his station, his face towards the sact, his head covered, and pointing with his staff to that portion of the heavens within the limits of which he proposed to make his observations. On the left were the propitious, on the right the unpropitious omens. 2. The ories and the flight birds. Fredictions founded on the observations of birds were properly called auspices, and were comparatas, as guess, the ceremonies, superstition of birds. Fredictions founded on the observations of birds were properly called auspices, and were common among the Greeks, who took them from the Chaldeans. They afterwards became so important, that, among the Romans, nothing of consequence in peace or war was undertaken without consulting birds, whose continual flight was supposed to give them universal continual fight was supposed to give them universal knowledge. They were propitious or unpropitious, either from their species, or from the circumstances in which they appeared. The birds of a prophetic cha-cacter were divided into two principal classes,—those whose flight and those whose cry was indicative of future events. In the latter class were included the tuture events. In the latter class were included the raven, the crow, the night-owl, and the cock; in the former were the eagle, the crow, the raven, the kite, and the vulture. The two last were always unpropitious. The eagle, on the contrary, was propitious when he flew from left to right; the crow and the raven were propitions on the left, and unpropitious on the right. Thirdly, the willingness or unwillingness of chickens to eat was considered ominus. the right. Thirdly, the winingness or unwiningness or chickens to eat was considered ominous. The former was interpreted as a good omen, the latter as a bad one. Chickens were made use of particularly in war. Besides these three principal classes, certain omens were drawn from quadrupeds; such as a best crossing a path, or being seen in an unusual place; or from occurrences more or less uncommon; as sudden melancholy, sneezing, spilling the salt upon the table, &c. Although the august explained the majority of the signs, and taught how the gods could be appeased, yet the right of inquiring how war would terminate belonged only to the commander-in-chief; and its fortunate or unfortunate issue was attributed to him alone. Ref. English Cyclopadia—Arts and Sciences.

AUGURS, aw-qure (Lat. augures).—Among the people of ancient tally, in common with all rude nations, it was imagined that in every occurrence which could not be understood there was a special manifestation of the will of the gods. The power of reading and interoccurrences more or less uncommon; as sudden melan-

the will of the gods. The power of reading and inter-preting these signs was supposed to be a peculiar gift conferred on the favoured mortal from his birth. A superstition offering se arrong a hold upon the minds of the people was turned to account by the actute poli-ticians of Rome, and the College of Augure was insti-tuted at the vary arrived. ticians of Rome, and the College of Augurs was instituted at the very earliest period of Roman history.
Augurs were, a certain sort of priests, who predicted
future events and announced to the people the will of
the gods. They were consulted both in public and
private affairs, and their influence in the state was
very great. By merely pronouncing the words Aliodie (another day), they could dissolve the assembly of
the people, and annul all the decreas that had been
passed at the meeting. The original number of augurs
is stated differently by Cheero and Livy. Dicero,
himself an angur, says that Romains associated three
ethers with himself, and that Numa added two. The

the extracedurary power was conferred aroun Augustus of electing angure at the pleasure. Bef. Legitic Cyclepastre Arim and Geimose.

August on past, in Chica, is the name given to the eighth meath of our year. It was named by the Bomes emperor Augustus, after insaell, as he regarded it as a fortunate menth for him, being that in which he had gained several important viatories. Before this time it was railed Scatilis, or the eight month, the year beginning with March. The same of July had, in like manner, been Questilis, before it was changed by Julius Casar; and as it contained thirty-one days, the senate, in order that Augustus might not be behind Casar, decreed that August as day should be taken away from February.

AUGUSTINE MONKE, as gue-lin, a chilipus order in the church of Rome, who follow the presented raile of Augustine prescribed to them by Pope Alexander IV, in 1256. There had arisen, previous to that time, several religious orders, which Innocent IV, formed the design of uniting into one congregation; and this was carried out by his successor. At present, the order is divided into several branches; as the Hermito St. Paul, the Jeronymitans, monks of & Reidget, and the Barefooted Augustines, the last being imitiated by a Portuguese in 1574, and onlinemed by Pope Clement VIII. in 1600 and 1602. The presented rule of St. Augustine is, briefly, that the monks are to have sell things in common; that the rich who either into the order are to sell their possessions and give them to the order are to sell their possessions and give them to the order are to sell their possessions and give them to the order are to sell their possessions and give them to the order are to sell their possessions and give them to the order are to sell their possessions and give them to the order are to sell their possessions and give them to the order are to the morning in labouring with their hands, and the morning in the bear of the passes of have a consisted the more of the passes of the passes of the passes of the passes of th

even in Austria and Naples it has been decreasing. It is most powerful in Sardinia and America.

AUK, GREAT, awk (Alca impensis).—Although this bird has occasionally been met with on the British coast, the northern latitudes are more congenist to the habits; and hence, owing to our limited acquaintance with the inhabitants of the Arctic regions, it is not very well known. In the collection of the British Museum there is a male specimen of this bird, which was sent to Mr. Bullock during his tour in the Crkneys. This was one of a solitary pair seen in those regions: the female was killed a little time previous to Mr. Bullock's arrival. That gentleman took part in a long chase of the male, but was unsuccessful; the auk, although pursued by a sir-oared bost, making its way under water with remarkable celerity. The wings of atthough pursued by a six-oaren post, making its way under water with remarkable relerity. The wings of the great auk are but partially developed. In length it measures about three feet, and its wings scarcely exceed four luches. Though the wings are almost uscexceed four inches. Though the wings are almost use-less for abrial locamotion, they are well adapted for assisting the bird's progress under water. How far north these birds may be found is not known; so far, however, as our Arctic explorers have pensitated, the great auk has always been seen. Its movements on land are somewhat swiwerd; and, indeed, it is alto-gather adapted for an agnosius existence. Except at the breeding season, it harely visits the shore. While

THE GREAT AUK

Ave, Legress (Dra Alle), is the most diminutive of the sak tube, and the hardiest The colder and wilder the region, there do they seem to congregate in larger flocks, and enjoy the inelement weather with as much reliah as their human companions the Esquissant. In the locality of Bathn's Bay they are found in large flocks, also at Melville Inland On the inhospitable wilds of Spitzbergen and Greenland thou asads of these birds find a home. Here they watch for the breaking up of the i.e., and then swarm down in myriads, and busily search for the rustaces in the distures of the broken ice—li very rarely visits this finance of the broken nee li very rurely vanta this
country; radeed, those that have been seen are more
probably storm blown casts ways than vantors in search presents where never have the little auk is a compact, storik hird, about nine inches in length. The upper parts of the plumage are mostly black, the checks and nader-parts white, the legs yellowish brown the bill black. In summer the front of the neck which during the winter is black, sesumes a paler but It lays one agg, of a pale blush green, and, like the pro-ceding, affects the high st chils

ceding, affects the highest chies

Ave. Rizos sur Leo (Alca torda), larger than the AUK, RAZON-BLILED (Alea torda), larger than the preceding; when full grown, it measures about fitteen incloss in length and twenty seven across the wings This species is found also in the Arctic regions, but, night that great sail, is a frequenter of warmer of matter, including the coasts of Great Britain, Franco, Holisaid, and Germany These birds take up their abode on the highest chiffs attainable, and live together in large flocks, associating with the guillemots aid sittewakes. About May the auk colonies begin their task of incubation, sitting closely together in low-one above site other. It is very remarkable, that, although the rason-billed auk lays but one egg, and so many Attaireds are accumulated on the chiffs at one time, without say fund of covering to it note their remany Attacrets are sommutated on the cume at our time, without say kind of covering to denote their re specifive owners, no inconvenience is occasioned, every ask knows we own egr, and probably in no instance is the pakermy of a young bird questionable. It has consistent some wonder how the eggs of the suk are commanded some wonder how the eggs of the auk are kept to becare on the small ledges on which they are laid, said if he remarked, that is a human shand were to remove one, the most delicate artifice would fail to replace it mas secure a position. The balancing powers of the said are, however, considerably overrated, for it has them assertained that the egg is attached to the spot by a ghibbous substance, with which it is, when newly laid, overred. The wasor-balled suk is very common in Scotland, and in the Hebrides are several breeding places. "Case of the most interesting is the little island of Bernersy, called by manuers Barray Head, and the finite from the coast of Scotland on the one hand, and it Kilda on the other, and one or a group of islant season the fighth Islan of Barray."

been observed petween the survey and the n of the earth, the magnitude needs being very play of the antere. Someonly fraverse distorbed during a display of the surces. Ans aronaof the surces may assumently fraterise the sky atright angles to this immension meridian, though deviations from this direction see not rare. Sie John
Franklis found that the dissurpance of the needle
was not always proportionate to the agitation of
the agreet, but was always greater when the quick
motion and vivid light were observed to take place
in a beay atmosphere. The surora is most frequent
and sivid in high latitudes, towards either pole;
but the meteor is not confined to these parts, as Dr.
Houker states that one of the most brilliant displays
he were wimenessed was under the tropical sky of India;
and other observers have recorded instances of its
appearance in the equatorial districts of the globe." and other observers have recorded instances of appearance in the equatorial districts of the globe." In 1831 a splendid aurora borealis was seen from the Gesport abservatory, and the published description attracts the feest idea of the brilliancy of this meteor and of its instres, colours, and aros. The approach of affords as the best idea of the brilliancy of this meteor and of its lastres, colours, and aros. The approach of the affords was indicated by a peculiar brightness in the atmosphere near the horizon upon the afternoon of the day when it was observed. Shortly after sunstantial and accordance to the northern bording, and acon assumed the form of an arc of refulerant light, ten degrees in height and seventy degrees an accordance in intensity of in width. It continued to increase in intensity of light, sepanding to the western point of the horizon and afty. Ive degrees to the eastward of north, which made the chord of the aurora a bundred and fifty-five A bright, flame-coloured rainbow-like arc. between three and four degrees broad, next emanated from the curved edge of the aurora to an altitude of thirty-five degrees, and, while it remained stationary, a beautiful rainbow-like arch still more brilliant sud dealy sprang up, so that the two bows presented themselves at the same time. After undergoing many variations, during an interval of an hour and a haif's duriation, a great many columns of light, the aurora sank considerably towards the horizon, but presently it increased in altitude, and vivid coruscations radiated from every part of its arc, and, on intermixing with each other, formed wide columns, which were so grand with erimson tints as to astonish every spectator. In less than three hours after its first appearing the surviva had spread at least two-thirds over the heavens, when large perpendicular columns and short, pointed, luminous coruscations rising upwards, glittering like spears with conical points, in nearly parallel rows, now mixing and ther dividing, all passing through red, orange, lake, crimson, green, and purple tints; so that the appearance over so vast an expanse of the heavens was exceedingly grand, particularly as it was contrasted by the cerulean sky and the spangled constellations of the southern portion of its hemisphere. Two hours later, the surers having passed through many more phases of beautiful luminosity, there was a grand display of about twelve or fourteen glowing columns from the aurora, after which a perfectly red rainbow-like arc, ten degrees above the aurora, becare ramow-uge are ten degrees above the aurora, because visible. These sppearances, with some slight modifications, remained during two hours and a half, when the interesting meteoric phenomena began to disappear—Ref. Dr. W. A. Miller's Chemical Physica; Mairan's Traité de l'Aurore borêule; Dalton's Meteomological Observatione; and the Philosophical Transactions, voids, xxiz. xxiv. &c. "The occurrence of aurers, Forestis," says Mr. Broke in his Natural Philosophy. "has invanishly been found, both at Greenwish and elsewhere, to be accompanied by considerable magnetic disturbance; and especially when brilliant corrections are observed to shoot up towards the zenith, large deflections of the declination and billar magnets occur simultaneously; but discharges of atmospheric electricity do not seem to have any of the presence of the magnetic instruments, for the pressection of the magnetic instruments, for the pressection of their and vivid flashes has been frequently potied at Greenwich, and no corresponding disturbance is indicated by the register."

Avairs districtly user, summers ones (Lat.), Mossic gold, is a gold-coloured metallic-looking submance, need for opening prender. It is a bisulphine of the looking prepared in the following names: As also gain of is prepared in the following manner, as absolving of 12 parts of tin and 6 parts of mesency is formed, and mixed with 7 parts of flowers of sulphur and 6 of sal ammoniae. The mixture is heated is a glass fluid to reduces, until the white funce at first formed occase to be disengaged, the bisulphide remaining baland in the form of hexagonal plates of light golden-yellow metallic appearance. Some years since, a passan was taken out by Mesers. Parker & Hamilton for an alloy of conner and give schick that terrand that true of copper and zinc, which they termed the true Mosaic gold. The specification directed that equal quantities of copper and zine are to be met of a the lowest temperature at which the former will fust, when they are to be well stirred and mixed combine. Small quantities of zine are then added by degrees, until the alloy assumes the desired colour. It is essential that the heat should be as low as possible, to

prevent the rapid evaporation of the zinc.

AURUM POTABLE, po-tüb'-i-le.—If ether is added to
a solution of terchloride of gold, it abstracts the whole of the salt from the water, and floats upon the top in a yellow layer. This compound, which is simply a solution of terchloride of gold in other, was formerly used medicinally under the above name.

AUSCULTATION, and kull-last show (Lat. ausculture, to listen), in Med., is a term applied to the method of ascertaining the healthy or diseased state of certain organs, by attending to the sounds bey produce, either on being struck, or in the natural performance of their functions. In a stricter seuse, the term aus-cultation is conflued to the latter of these cas , the most important discoveries of modern medical gience;

for, though Hippocrates gives directions how, by acs-cultation, fluids are to be detected in the thorax, yet the subject seems to have attracted no attention for many centuries. In 1761, Leopold Avenbrugger, a physicism of Vienna, published a small volume in Latin, cutitled Inventum novum ex purcussions thoracis humani, as signo, abstrusos interni pectoris-morbos detegendi. The work however, excited little notice till it was translated into French in 1808 by Cornsurt. Soon after this the practice of percussion t came general in France and other parts, and was attended with results far more precise and certain than had been anticipated. In Lacunce's invention of the stethoscope, (See Seg-russcore.) Auscultation is chiefly valuable as throw, ing light upon the diseases of the organs of circulation and respiration in the chest. By carefully studying the varieties of sound (often extremely slight) produced by the organs in health and disease, the skilful physician is able to judge of the condition of these organs

with the greatest accuracy, and thus detect and adopt the best means of arresting incipient disease.

AUSPICIUM. (See AUGURIES.)
AUSTIN'S PLOTTING-SCALES.—The principle of these hilateral double-offset plotting-scales is extremely simple and convenient. The code of the scale have brass cross-pieces, with "station-pointers." By adbrass cross-pieces, with "station-pointers." By adjusting the scale so that the "station-pointers" ere upon the base-line, the zero of the offset scale is made The offest scale being grato coincide with this line. duated right and left from zero, the offsets on either hand can be plotted with facility as fast as they are read off from the field-book. The trouble and delay of either shifting the scale or going over the survey twice (once for right offsets and once for left offsets) is thus obviated. The Civil Engineer and Architect's Journal thus further describes this useful invention : — 'In each cross-piece are two steel spring points, which are worked by a screw with a milled head. By these the ends of the scale are fixed down to the paper dispurpance is indicated by the register."

Appearance of the control of the cont

in the scales, the left-hand scale being serrangement at least three chains de of the base-line can be plotted No. 3 pae scale is given, graduated on either The brass cross pieces form T heads, so as to pair of station pointers for each side of the is the comment in stated to be less costly.

Lightful of being more readily fixed to existing the first pattern the 'station pointers' on the case of the cost of the case of as they are on a brass bar which slides either a shade-and-pinnon movement. This is intended the statement, not only for survey, but for a statement, for which, no doubt, it allords some advantages. The racks must, of course, he market so that they can be set to suit the length of offset reales for which they are intended. They ought to work fries, and eather stiff, and, if not turnshed with sized, youngs to pin their ends down to the board should be claumed by the same movement that pure stown the same. This method affords marked facilities for pioting in all eases where the offsets do not exceed a certain limit, and it will not fail to recommend itself as it effects a considerable saving of time, both in plotting from a field-book and in plotting to a reduced ala i

AURTRALIAM MARNA, one tran h on n n m, a sac charine substance, exuded spontaneously by the leaves of several species of hmalpplus, on min tree, natives of Australia. It resembles manna, but does not contain mannie, the sweet principle being a peculiar had of sagar, to which the name militim has been given it is said to drop from the leaves of X runn fera in

please sometimes as large as almonds
AUSTRAL Signs, and full (Lat at fully, southern, signam, a sign), an expression applied to the last six signs of the zodiac, numers, the autumnal signs I ibra, Acorpso, and Sagittarius, and the winter signs Capit carpus, Aquarus, and Pisce, because they he to the

Appananto, an then tik (Gr authint k , authentic, watchated), is a term applied to something of established authority, something which is what it appears is professes to be. It is usually applied to a writing regionment written by the person, at the time, or mader the orroumstances, that it asserts or implies the transfer authentic in made between authentic and sequine; the former referring to the statement made by an author, the latter to the authorship itself, nat this distinction is not very giver illy observed a determine the authorizers of a document is often a between the highest to be longs to the highest

of the utmost importance, and it belongs to the highest find of orizonan. The proof is of two lands, internal, from the form and contents of the document itself, and external, from the evidence of others.

ATEROR, im 'this (Lat. auctor Fr auteur), is applied to one who cleates or produces anything, or one who writes upon any subject, as opposed to a translation of compiler. It is given by way of commence to chief, as the Author of the universe. The term is also reported any light of the original inventor or described where applied to the original inventor or disconnections. times applied to the original inventor or disco-

of any new art or principle. as a right or power to command and make chered, as royal authority, parental authority in their or religious matters, it is the assumed considerated or religious matters, it is the assumed the distance attributed to certain fithers, councils, but a treatment of the bourts. AUTORIORATEX, do to to properly (ki lus, life; and grapho, I write), is a big of a person, written by histociff. If a biography be interesting and materiality on is a well-written autobiography. In case the actions of the individual are look distance, and their motives indicated at in the latter the actions are at hand, a are in general well known. In the last how the man himself viewed his artis in the former, how they appeared a almost impossible, and, perhaps, that autobigrapher should disclose with partiality the whole particulars of his Hithereal motives of his actions; but swite to conceal them becomes of itself a si closure. He betrays himself when he it, and the more cautious he is to come nesses, the more manifest do they appearments of an autobiography he in ris is success and complete as possible. In this comes valuable in a psychological point of throwing light upon the mental conditions In this Among the most celebrated works of this ' (onlessions ' of St. Augustine and Ro autobiography of Gothe (Wahrheit und a work of this class, is of comparatively i

as what of the class, is of comparatively active the and as it as believed to partiake too much of the element. Inother kind of autobiography is which the writer does not so much relate the of his own lit, as that of the person with whom he came in contact.

Attoceact, is tok-rase (Or assus, self; power), is that form of government in whi a verieng exercises uncontained in wand the a verieng exercises uncontained in the state and executive powers of the state. Alm at all feature states have the form of government—in Phil, the term is used by Rant to denote the mastery of the reason over the rebellious propensities

ALTOCRAT, an to knit (Gr. autos, selfe kratos, power), a person vested with absolute independent power, a sovereign who rules uncontrolled. The title was first given by the Athenians to a commander. me-chief vested with underputed powers, and not habe, like others, to be called to account at the assigny of his office. The title was afterwards seamined by the Byzantue emperore, and, at present, the ampeture of Russia bears this title

AUTO DA II (See ACT OF PAITH.)
ALTOGINOLS SOLDERING (See SOLDERING, AUTO-GINDUS )

Autogram, an' the graff (Granton, and grophs, I write), is a term applied to what is written by a person's our hand, an original manuscripp; as opposed to an apograph or copy Autographs, particularly of celebrated persons, have in recent times become objects

of eager pursuit, and form a breach of literary trade. The autograph of that spare now in the British Museum cost £100; that in the library of the city of London

£158. In general the value of an autograph depends upon the eminence of the individual, the scarcity of specimens of his handwriting, and the contents of the writing. Lithography has been vary useful in affording the means of making farshmilts of autographs. The first English work in which a sense of farshmiles of autographs appeared, was six John Fenn's "Original Letters from the Archives of the Paston Family," 1767. Among the best works of this base are "Autographs of Reval from the Archives of the Paston Family, 1787. Among the best works of this class are, "Autographs of Royal, Noble, Learned, and Bennarkable Personages conspicuous in English History from the Reign of Richard II. to that of Charles II.," by John Gough Nichols, folio, 1825; "Iconographe des Hommes Celèbres," 3 vols, Paris, 1828-39. Supplement, 1839; "Autographen-Prachaltenn zur 220 jährigen Gedächtnissfeier des Westläugens Friedenschlusses," folio, Leipsic, 1848. Lavater believed that the character of an individual was shown by his headwriting; and recently persons have professed to be able to determine characters in this way. There are, however, generally so many circumstances that have an influence in forming one's handwriting, Independent of self, that it is but seldom that it can allord much insight into character.

Autowaturn, 222-221.

ATTOMACTER, and dom'd-life, a species of corundum, found in octohedra. It consists principally of alumina and axide of sinc, and generally occurs associated with

zinc-blende and glauce.

Arronting Actions, aw-to-mell-ik, is a term applied in Psychol. to certain nuscular movements which are influenced simply by sensation, and not at

all by the will; as winking.

AUTOMATON, aw-tom'-a-ton (Gr. autos, self, and mao, I move, a machine so constructed as to move in imitation of the actions of living animals. The term assisted (from the Gr. aner, a man) is also applied to pieces of mechanism built in the form, and initiating the motions of men. The ingenuity expended upon some of these remarkable contrivances is very surprising. Four hundred years before the Christian era, Archytas of Taranum is said to have constructed a wooden pigeon that could dr. Albertus Magnus made an automaton to open his door when any one knocked. The speaking head of Roger Bacon is a familiar tradition. Region montanus invented a wooden eagle, that flew from the city to welcome the emperor's return, and an iron fly, that flew about the room, and then returned to his hand. These ancient instances are no doubt exaghand. These ancient instances are no doubt exag-gerated, if not entirely untrue; but, in modern times the construction of many extraordinary automata has been well authenticated. The flute-player of Vaucanson is fully described by M. d'Alembert in the Ency-clopédic Méthodique, art. Androide. It was exhibited in Paris in 1738: It played on the flute after the exact manner of a hying performer, and commanded three octaves, the fallest scale of the instrument, containing several notes of great difficulty. Its height was nearly six feet, with a pedestal, in which some of the six teet, with a penessal, in which some of the machinery was contained. Two automaton flute-players, of the size of life, were exhibited in this country some years ago. They performed ten or twelve duets. M. Camus constructed an automaton group for the amusement of Louis XIV. It consisted of a coach and horses, with a coachman and page, a lady inside, &c. When opposite the king, the horses stopped, the page got down and opened the door, the lady slighted, presented a petition, and re-entered the carriage; the page then shut the door, the carriage carriage; the page then shut the door, the carriage drive away, and the servant run after and jumped up behind it.—(Ref. Hutton's Mathematical Recreations, vol. fi. p. 35.) In 1741 Vancanson produced a flageolet player, which beat a tambourine with its right land while it played the flageolet with its left. He also constructed a duck, which ewano, drank, dubbled in the water, and quacked like a real dack, raised and moved its wings, dressed its feathers with its bill, took barley from the flash, awallowed it, and even digested its food by means of materials provided for its solution in the atomach. The investor made no accord of the in the stomach. The inventor made no secret of the machinery employed. Macket, the inventor of the metromone, exhibited an automaton trumpeter at Vienna, which is described in the Journal des Modes for 1809. It was a martial figure, attired as a trumpeter of the Austrian dagure, attired as a trumpeter of the Austrian cavalry march, and all formality. The pulp obtained by the chawter, who the signals of that army, but also a march and an

altegro by Weigi, which was accompanied by the whole crohestra.— (Ref. Dichesory of Musiciana, London, 1837) Many other automats are described by Hutten, one of which they Microsees, another physical on the planefortef &c. The farnous chose-playing automaton pranaforter ac. The farnous cheen singing ameniation is considered a solved mystery,—a boy was concealed inside the figure. The last remarkable automatic group was exhibited in London in 1806. A membey capped his jaws together as he held a violin; a hare browsed upon a cathere; a gost uttered an audible cry; a child that had been sleeping in a cradle woke upon as a solvent of the large and state of the cry; and sta unls, except the child, which was a failure

AUTONOMY, aw-ton'-o-me (Gr. autos, sell, spd nomos law), denotes that kind of government in which the citizens of a state make their own laws and manage their own public affairs. In Phil, the term was used by Kant to denote the severeignty of reason over all our actions, as opposed to beteronomy, in which our soldons are directed by motives or desires contrary to the dictates

of reason.

Autorsy, aw-top-se (Gr. autopma, fish, bulos, self, and opsis, sight), denotes personal observation, and is applied to the knowledge which one sequires by center observation, in contradistinction to that which is communicated to him by the accounts of others.

AUTREPOIS ACQUIT, of r(e)'-finaw ak-e' (fr., previously acquitted), in Law, is a plea by a person indicted of a treason or felony, that he was heretofore acquitted at the same treason or felony; for no one shall be brought. into danger for the same offence more than once. An acquittal upon an indictment for murder may be pleaded in bar of another indictment for manaleughter, because the defendant might have been convicted of manslaughter on the first indictment. On this piea, incases of felony, the prisoner must plead over to the felony at the same time, so that he may be tried for the latter if the former be not allowed. In cases of misdemeanours, as the defendant cannot plead over, the judgment upon a plea of antrefois acquit, which is inbar, is final, and sentence will be pronounced against him, if the plea be not sustained.

AUTREFOIS CONVICT (Fr., previously convicted). A man convicted of an offence may plead such conviction in bar of any subsequent indictment for the same

offence of which he was convicted.

one nee of which he was convicted.

AUTUIN, act lim (Lat. adamnus), is the name of one of the four sensons of the year,—that in which the fruits of the earth are gathered in. Astronomically, speaking, it is the period during which the sun is passing from the autumnal equinox to the winter solsting (from 23rd September to 21st December). The inhabitants of the couthern hemisphere have spring when those of the northern have autumn.

AUTUMNAL EQUINOX. (See EQUINOX.) AUXILIARY SCREW. (See SCHEW-PROPELLER.)

AUXILIARY VERBS, aux-il'-ya-re (Lat. auxiliari, to help or assist), in Gram., are those helping verbs by which other verbs are principally conjugated. They are also termed relational verbs, as denoting the relations of action, and as distinguished from notional verbs, which imply notions of action. They are divided into auxiliary verbs of tenses, and auxiliary verbs of mood. The modern languages, particularly our own, abound in such forms; and the ancient languages of Greece and Rome were not without them.

a'-ra, an intoxicating liquor used by the South-Sea islanders. It is also known under the names of Cava and Arva. In Tahiti, the use of it is said to have swept off many of the inhabitants. In the Tonga islands it is prepared and drunk on every festive occasion; and in the l'espe islands the preparation of the king's morning drink of ave is one of the most solemn and important duties of the courtiers. The use of ava was forbidden in the Sandwick salands

## Avalanche

thrown into a bowl and mixed with cold water. After this mess has stood for a little while, the liquor is strained from the chewed fibre through concarnal husis, and is then ready for use. Professor Johnston, in describing the preparation of ava, suggests that the salive may produce a chemical charge in the ingredients of the root, and that the intoxicating properties of the liquor may depend, in some measure, upon such change.

Avatancie, av-d-lanck (Fr., from the Lat. ad, to, and calles, valley), an accumulation of snow descending from the precipitous slopes of a high mountain into the valley below. Avalenches generally result from the partial melting of the snow in spring. The carth, warmed by the rays of the sun, melts the under layer, and thus destroys the adhesion of the mass to its surface. The least agitation of the air will some-times cause the fall of an avalanche; and for this reason experienced Alpine travellers generally preserve strict silence when in the neighbourhood of dangerous masses of snow. In Switzerland avalanches are common, and sometimes destroy entire villages. thinds of avalanches are distinguished. A drift avalanche consists of loose and powdery snow, set in motion by a strong wind; a rolling avalanche is that produced by a detached mass of snow rolling down the steep, and ficking up the snow over which it passes; a sliding avalanche consists of an immense mass which has lost its adhesion to the surface through partial melting; lastly, a glacial avalanche is that made up of musses of frozen show and ice from the higher regions of the mountain.

AVANTURINE, a-vant'-u-rine, a chocolate-coloured -variety of quartz, containing spangles of gold-coloured tariety of quartz, containing spangles of gold-coloured wides, which give it a peculiar play of colour, as if metallic particles were dispersed through its mass. It is now made artificially by mixing copper fittings with glass while in a state of fusion. Artificial avanturing is far more lustrous than the real mineral. Avanturing the state of the state o more assessed than the ren more at Avan-turine felspar owes its glitter to particles of Titanic iron. "The name Avanturine," says Jackson, in his "Minerala and their Uses," "is said to be derived from the following circumstance:—A French workman baying by accident, or paraventure, dropped some copper Illings into a vitreous mixture in fusion, gave the name Acadurine to the sparkling mass which was thus produced; and it is still by a similar process, though greatly improved, that the artificial production is now manufactured, to be employed for various ornamental purposes. The artificial far exceeds in brilliancy the natural avanturine. A species of avanturine is also produced by heating pieces of quartz to a certain degree and suddenly cooling them; this occasions a number of minute fissures in the mass, which, by the unequal refraction of the light, gives the stone the desired appearance."

AVARI, or AVARES, a-vair'-i, in Early Hist., is the name of a Mongolian race that, about one hundred years after the Rugarians, made their appearance in the countries about the Don and Volga. They have been conjectured to be the Aorsi, or Adorsi, of Strabo. A portion of them remained at the Canessus, while another portion of them, about the middle of the 6th century, passed on to the Danube, and settled in Ducia. Here they served in Justinian's army, assisted the Lombards to destroy the kingdom of the Gepide, and gradually conquered, towards the end of the 6th century (especially under the powerful king Bajan), the region of Pannonia. Afterwards they conquered Dalmatia, made devastating incursions they conquered Baimatia, made devestating incursions into Germany as far as Thuringia, and into Italy, where they combated the Franks and Lombarda, and extended their dominion over the Sclavonians, dwelling on the Danube and morthwards, as well as over the Bulgarians on the Black Sea. At Length, these various nations rose against them, and, in 649, drove them out of Dalmatia. Confined to Pannonia, they were substant of Charlestonia. of Dalmatia. Confined to Pannonia, they were sub-dued by Charlemagne in 796, and afterwards were nearly extirpated by the Moravians and Petscheneges; so that after 827 they disappear from history. They were wont to surround their settlements with circumrellations of stakes and earth, of which in the countries which they inhabited, traces are still to be seen, and are known by the name of Avarian rings.—Not. Brookhaus' Converse ons-Lexikon.

#### Avena

Avast, a vast' (Ang. Sax.), in Mar., is an order to stop or pause in any exercise; thus, seamen use the phrase "syst heaving," to desist from drawing in the

phrase." avast heaving," to desist from drawing in the cable or hawser by means of the capstan.
Avaria, a'-sa'dur, in Hindoo Myth., is applied to the incarrations of the deities, or their appearance in some manifest form upon the earth. The word is Sanserit, and properly signifies a descent, or the act of descending. The number of avatars related of Vishnu and the other deities is very great.—Ref. English Cyclamatia—Arts and Sciences. padia-Arts and Sciences

AVELLANE, ac-el-luin (Fr. avelline; Lat. avellana, a filhert-nut).—In Her., the name given to a peculiar form of cross composed of four hazel nuts or filberts inclosed in their perispermium or shell.

AVE MARIA, ai'-ve ma-ri'-a (Lat., Hail Mary), a prayer of the Roman Catholic church to the Virgin Mary, so called from the words with which it commences. It is also called Angelica Sulutatio, or the Angelic Sulutation; these words being the beginning of the salutation which the angel addressed to Mary, as he announced to her that she was to be the mother of the Saviour. The invocation was first used by the priests during mass on the fourth Sunday after Advent, by an ordinance of Gregory I. With the extended worship of the Virgin since the 11th century, the Ave Maria has come to be a lay prayer nearly equal in use with the Peter Noster, and was sanctioned as such at the end of Pater Noster, and was sanctioned as such at the and of the 12th century. In the first half of the 16th century the prayer came generally to receive, as a conclusion to the earlier formula, the words "Holy Mary, mother of God, pray for us sinners, now and at the hour of our death. Amen." John XXII., in \$226, ordained that every Catholic should, at the ringing of the hells, morn-ing, noon, and night, repeat three aves. The aves are ing, noon, and night, repeat three aves. The aves are reckoned by the small beads of the rosary, which are hence culted Ave Marias, while the large beads are used in the Pater Nosters. To this custom Byren alludes in the following beautiful lines:

" Ave. Maria! blessed be the hour, The time, the clime, the epot, where I so oft Have felt that moment in its fullest power Sink o'er the carth so beautiful and soft: While swing the deep bell in the distant tower, Or the faint dying day-hymn stole aloft,— And not a breath crept through the rosy air,
And yet the forest leaves seem'd stirr'd with prayer.

AVENA, &v-e'-n", in Bot., the Oat, a gon. of grasses (nat. ord. Graminacca). A sativa is the botanical name for the common oat, many varieties of which are cultivated in the north of Europe for the grains. Oats are extensively used as food for man and domestic When deprived of the husks, and coarsely animals. ground, they form outment. When merely directed of their integuments, they are called groats; and these when crushed constitute Embden and prepared groats. Oats are also employed for the production of alcohol. The recent experiments of Professor Buckman, of the Royal Agricultural College, show that the cultivated varieties of the out are derived from the wild out, A. fatura. This parent species attains the height of from three to five feet, and is a mischievous weed in corn-fields. The seeds are covered with stiff bristles of a brown colour, and each is furnished with a long bent awn. About ten years since, Professor Buckman collected some of these seeds, and in the following spring commenced the cultivation of the wild oat in the experimental plots of the Royal Agricultural College. Year by year the seeds were saved, and the interesting transformation of a weed into a productive cereal grass was traced through all its successive stages. In the first year, a lighter-coloured fruit was obtained; in the second, the fruit exhibited a less degree of hairness; in the third, a greenish, straight, and slender awn took the place of the black rigid one, bent at right angles, which characterizes the wild plant; in the fourth, the fruits were much more plump, owing to the greater development of grain; in the fifth year, the ripe fruit separated from the floral envelope less readily than in separated from the norm entering the reservation the case of A. fatua. These changes were reported in 1855, and the professor was encouraged to continue his experiments for a few more seasons. Accordingly, in the spring of 1856, seed, the produce of the pre-

171

ceding year, was sown in a propared bed, and the result was a large admixture of two forms or types of crop-oats, one with the flowers all round the stem, the potatio-oat form of the farmers, and the other with the flowers all drooping to one side,—the so-called Turtarian oat. Since then, Professor Buckman has grown the two sorts so derived, in the field, and with a gradual improvement in point of productiveness and weight per bushel. The same acute observer has lately watched the production of wild oats as a gradual degeneration from cultivated ones. The hairy sceds of the wild oat are sometimes used by anglers instead of artificial flies.—Ref. Buckman on Corn, in Popular Science Review.

Science Review.

AVANGER OF BLOOD, d-ven'-jer.—In the early ages, the penalty of death for the crime of murder was not inflicted by any legal tribunal or public authority, but it was considered the duty of the most immediate relative of the victim to hunt and slay the murderer. The Hebrew word Good signified the avenger of blood; it had also a wider signification. The Mosaic law placed this recognized institution of the rude social condition of the times under certain regulations, prohibited the murderer from purchasing by money a ransom for his tife, and appointed cities of refuge for the manslayer not guilty of positive murder. The doctrines of the Koran permit the avenging of blood by the nearest kinsman, but allow him to receive money as a com-mutation for the murder. The Arabs follow the primitive custom to this day. Hereditary feuds of class; families, and tribes, have always originated in the avenging of blood, of which the Vendetta of Corsica is the most modern and familiar example in

AVENUE, av'-c-nu (Lat. ad, to, venio, I come), an opening, entrance, or passage, by which anything may be introduced. The term is also used in landscapegardening, in order to distinguish the path leading from some other road, and forming the direct approach to a house. Any broad walk or road, bordered on either side with trees, is also called an avenue. In the latter case the trees may either be in rows on the sides or in clumps at some distance from one another. The trees mostly used in England for avenues are the English elm, the lime, the horse-chestnut, the common

enguan eim, the time, the horse-chestnut, the common chestnut, and the beech. A wide straight street is also called an avenue, as in Washington, in America.

AVERAGE, GENERAL, äv-e-rij (Fr. avoir, to have or possess), in Com., whatever loss or damage is incurred by any portion of a ship or eargo for the preservation of the rest. When such damage accrues, the several persons interested in the vessel, freight, and cargo, each contribute their proportion to indemnify the owner of the part in question, against the damages or expense which has been incurred for the general bene-It is understood that this allowance is for loss or damage that happens accidentally, and is not a voluntary and purposed loss or damage. General average also implies that the whole adventure has been in jeopardy. Every description of loss incurred on any portion of a cargo during a voyage is denominated average, or, sometimes, particular average.

AVERROA, in-er-ro'-a, in Bot., a gev. of plants belonging to the nat. ord. Oxalidacea, and consisting of two species, both being small trees growing in the Bast Indies. They produce sour fruits, which are much eaten by the natives, but which are not relished by Europeans, except when in pickles. The botanical names of the species are A. bilimbi and A. carambola, and the fruits are known respectively as the Blimbing

and the Carambole.

AVES, ai-veez' (Lat., birds), in Nat. Hist., the second

class of vertebrata. (See Brins.)

AVIGENSIA, är-i-sen-ni-a, in Bot., a gen. of plants belonging to the nat. ord. Myoporacea. The species The species are natives of Australia and America, and grow, like the mangroves, in salt marches. In a proven me the mangroves, in salt marches. The bark of A. tomentosa, commonly called the white mangrove, is much used in Brazil for tanning. A. resinifera, which grows in New Zesland, yields a green resinous substance, which is eaten as food by the natives.

ANUTLE MARKET AND A MARKET OF TRAINS COMMITTEE.

real commercial value, however, of this peculiar oyster rests on the real pearls often found in its interior. AYIOUDORECTR, and wid-ul-p-get-ten, in Good, a gen-of fossil bivalve mollusks, peculiar to the carboniferous

imestone and often so well preserved that even the colours of the living shell are retained.

Avocado Pear. (See Persea.)

Avocado Pras. (See Persea)
Avocat, de e-ke (Fr., from Lat. ad, to, and vocare, to call).—An advocate in French law answers, in some measure, to a barrister or counsel in ours, with this difference, that the latter cannot, according to the etiquette of the English bar, undertake any matter or cause in which his advice or assistance is required. except through the instructions and retainer of a solicitor or attorney; whereas an avocat corresponds with his client, and acts in the double capacity of counse!

and attorney. (See Barrister, Courski...) Avocst, or Avosstra, &-o-set.—The chief peculiarity of this squatic bird is the form of its bill. It is very thin, flexible, of a substance like whalebone, and turns hookwise, but in an opposite direction from the hawk and other tribes. The plumage of the svocet is black and white. Buffon makes the hird's bill a subject for lamentation on the blundering of Nature in so ill providing a creature with a means of sustenance. Mudic, however, takes a contrary and a proper view of the matter, and demonstrates that for scooping, probing, and heating the water, while the mandibles act as a trainer and retain the finny prey, the avocet's bill is most admirably adapted. A few years ago, and in the fen-bird season, it was no uncommon thing to find the avocet in the London poultry-market; now, however,

Avoidance, accel-dans (Ang.-Nor.), in Law, in the general signification, is where a benefice is void of an incumbent, in which sense it is opposed to plenarty.

(See BENEFICE.)

Avoiduptors, or Avendurois, de-or-du-poic' (pro-bably Fr. avoir du poids, to have weight), the name given to the system of weights used both in England and America in general commerce. The ounce conand another areas whereas the ounce in both troy and anotheraries weights contains 480 grains. There is fortunately but one grain which may be taken as a common unit in comparing the three systems of weights used in Britain. The value of the grain is set forth in the act of parliament 5 Gec. IV. c. 74, in the following words:—"A cubic inch of distilled water weighed in air, by brass weights, at the temperature of 62° of Fahrenheit's thermometer, the barometer being at Fahrenheit's thermometer, the barometer being at 30 inches, is equal to 252 grains and four hundred and fifty-eight thousandth parts of a grain." The pound avoirdupois' contains 7,000 such grains. The lowest term in avoirdupois weight is the dram, which contains 2733 grains. The dram is, however, seldom, if ever used now, small weights being expressed either in grains or in fractions of the ounce. The following table displays the comparative rather of the different displays the dis displays the comparative values of the different denominations in avoirdupois weight :-

The usual contractions are as follows:—ounce, oz.; quarter, qr.; pound, lb.; hundredweight, cwt. There is a very useful rule for reducing a large number of is a very userin rule for reading a large states of pounds to hundredweights roughly, which may be given here. This rule may be thus briefly expressed :—From all but two figures take all but three. Example: 17,034 lbs. contain 159 cwt., the sum being got at thus:—

176 (all the figures except two)
17 (all the figures except three)

When the number of hundredweights exceeds 100, the error can never be greater than two. In compounding and prescribing medicines, and in weighing the precious metals and precious stones, other systems of weights are used. (See APOTHECARIES' WEIGHT, TROY.)

Avicula, a circulate a general marine conchifers, the shell of which is imported in considerable quantities, and used, under the name of mother-of-pearling at the construction of buttons, knife-handles, &c. The

constitute an award; it is sufficient if the arbitrator express by it a decision upon the matters submitted to him. If the matters are submitted to the determination of two or more arbitrators, the award should be executed of two or more armprators, the award should be attended by all, at the same time, and in the prespice of each other. The award must be made within the time limited by the order, bond, or agreement of reference, or within such enlarged time as the arbitrators may fix, in cases where such power is reserved to them. The publication of the award dates from the time of The publication of the sward may be set aside if it appear manifestly, from the merits, that the arbitrators have acted dishonestly or corruptly; but not if the decision be contrary to law, unless the mistake appear on the face of the award or of another paper delivered with the court act acid an award absolutely. ice of the award or of saide an awards absolutely void or doubtful, unless it is capable of being enforced without suit, but will leave the party to his action upon it. The following are the usual grounds upon which an award may be set aside:—1. That the arbiwhich an aware may be easiled. The contract where have not pursued the submission in every material point, or have in any other respect exceeded their authority; 2. that the award is uncertain or ambiguous; 3. that it is not final, either by reason of not deciding all the matters referred, or otherwise making subsequent proceedings necessary; 4. that it is inconsistent; 5. that it is illegal; 6. that the proceedings were irregular or fraudulent; 7. that the arbitrators have misconducted themselves; 8. that it arounds an the fine of the award that the arbitrators have mistaken the law; 9. that it is had in part not separable from the residue. The performance of an award may be enforced,—I. By action, where there is no cause in court, or the instrument of reference does not contain a clause that the submission shall be made a rule of court; 2. where the submission contains such a clause, by action, attachment, or execution, as the practice of the court in either case may warrant. An award must be stamped with the following duty:— where the amount or value in dispute shall not exceed £50,—2s. 6d.; £100,—5s.; £200,—10s.; £300,—15s.; £750,—£1; £1,000, and in all other cases not provided

for, £1. 15s. (See Arbitration.)

A. WRATHER, weth'-er (Ang.-Sax.), in Mar., a term signifying that the atuation of the helm is to the weather side of the ship, in contradistinction to a-lee.

weather side of the sinp, in contradistinction to a-tee.

Aweigh. (See Arista.)

Awning, awn-ing (Gothic, halyan, to cover), in

Mar., a canopy of canvas or tarpaulin spread over a

boat or the ship's deck, as a protection to officers

and crew against too great solar heat, or to preserve the deck. The awning is generally supported by a range of light posts called stanchious, erected along the right and left sides of a ship: in the middle it is supported by a complication of small cords called a crowfoot. The term is also applied to that part of the poop dock which is continued forward beyond the bulkhead of the cabin.

Axe, ar (Sax. aex), an iron instrument, generally used with both hands in hewing timber and chopping wood. It consists of a head with an arching edge, and a handle. There are several forms of the axe, the two principal being the broad axe for hewing, and the narrow axe for cutting and rough-hewing. The hatchet is a smaller form of the axe, and is used with one hand. AXE-STONE, a green variety of jade found in New Zealand and on the banks of the Amazon, and used by

the natives for making hatchets.

ATH, ATHLEARY, ax-il (Lat. axilla, armpit), in Bot., the upper angle formed by the leaf with the stem is called the axil, and everything arising at that Dark and a stem as a stem and a stem as point is said to be axillary. Buds are usually axillary. Anything springing from the stem, either above or below the axil, is extra-axillary; if above, it may be described as supra-axillary; if below, as infra-

AXILLA, ax-il'-la (Lat.), is applied in Anat. to that cavity under the upper part of the arm called the armpit. Hence the term axillary is applied to the

armpt. Hence the term aximary is applied to the arteries, roins, glands, &c., of this part.

Aximize, &x-e-nile (Gr. axine, an axe), a variety of garnet found in mice-clost in Dauphine and Cornwall; so called from the axe-like form of its crystals.

Axiom, &x-i-om fir. axioma, worth, authority), is

properly a self-evident proposition of a theoretical character. It was originally applied to geometry by Aristotle, in which science it means a proposition which it is necessary to take for granted; yet Euclid did not employ the term. What we now call axioms were denominated by him common notions. It came into protty general use in the 17th century in this country. A consideration of the reasoning process is sufficient to indicate the necessity for general axioms; for whether we deduce or induce we must either for, whether we deduce or induce, we must either begin with the indemonstrable or end in it. Lord Bacon himself employed the term axiom to denote an empirical law, gained by an induction from particulars. This use of the word is somewhat ifregular. In any process of demonstration, the deduction of propositions from the comparison of other propositions must begin somewhere, so that there must be at least two propositions to begin with, whose evidence must be derived from other sources than reasoning. They must at last fall back upon the native intuitions, or instincts, or data of the mind for these first principles or axioms of all reasoning. Every attempt which has been made to dispense with these primary data of consciousness has failed; and the persons who have made the attempt have only been wiled on to their own destruction by some subtle paralogism. The axioms, or, more properly, the "common notions," employed by Euclid in geometry have been for the most part employed by other writers and are obviously constructed with no fall back upon the native intuitions, or instincts, or other writers, and are obviously constructed with no very close regard to the distinctions of metaphysics. very close regard to the distinctions of metaphysics. Among them, or attached to them, we usually include the postulates, or things demanded to be done. The whole of these axioms of geometry may be conveniently divided into three classes,—1. Those in which the truth is asserted in the direct meaning of the words employed, and which it is impossible to deny until the meaning of the words is altered. Such are the 8th and 9th of Euclid's axioms. 2. Those which are true of 9th of Kuclid's axioms. 2. Those which are true of all magnitudes and spaces alike, with no exclusive reference to geometry. Such are those from 1 to 7 of the axioms of Euclid. 3. Those which have a direct bearing on geometry itself; as the three postulates and the last three axioms of Euclid. Many other assumptions are to be met with in the reasonings of Euclid not to be found in this formal announcement of the axioms or common notions. But these are so trivial, that no one, except a close scientific reasoner, will be likely to find fault with them, if he can discover them at all. Every science has its axioms, elementary principles, or leading ideas, around which all the rest gravitate as towards a centre. This is essential to the existence of any body of knowledge, without which it would crumble down into a series of empirical details.

Axis (Lat., a pole, or axle-tree), a term common to all the sciences, being applied to any line about which objects are symmetrical, around which they turn, or to which they have some common relation. In Astron, the term is applied to an imaginary line passing through the centre of a heavenly body in a direction perpendicular to the plane of rotation. The axis of the earth is that diameter about which it revolves with a uniform motion from west to east. The poles of the earth are the points where the axis meets the surface. The sphere of the heavens, that is the imaginary spherical surface of infinite radius of which the earth it has been presented to be a surface of the sphere of the surface. is the centre, necessarily appears to revolve about the same axis, but in an opposite direction. The poles of the heavens are the points of this imaginary sphere to which the earth's axis is directed. The axes of the which the earth's axis is directed. horizon and equator are lines drawn through the cenhorizon and equator are times around not carriers of these great circles, and at right angles to their planes.—In Bot., the term axis is applied to the central part both above and below ground, around which the whole plant may be said to be arranged. The stem is called the ascending axis; the root, the descending axis. -In Geom., the word axis is used to denote a right —In Geom., the word axis is used to denote a right line around which a plain figure revolves to produce a solid. Thus, a semicircle, by moving round its diameter, describes a sphere, the axis of which corresponds to the diameter: a right-angled triangle, by turning round on its perpendicular, in like manner describes a cone, of which the axis is that perpendicular. The word is generally employed to designate a line which we may conceive to be drawn from the summit of a regular figure to the centre of its base.—In Phys., the

word is used in many different senses. The axis of a lens is an imaginary tine joining the carie of a telescope opposite surfaces of the glass. The axie of a telescope or microscope is a right line which passes through the centres of all the louses in the tube. The axis of the eye, or visual axis, is the right line passing through the manner of the number of th lens is an imaginary line joining the centres of the two opposite surfaces of the glass. The axis of a telescope eye, or visual axis, is the right line passing inrough one centres of the pupil and crystalline lens. The axes of a crystal are imaginary lines, about which the planes are symmetrically arranged. The axis of rotation is the line around which a body turns when revolving. The axis of oscillation is a line passing through the point about which an oscillating body—a pendulum, for in-

Axis Deen, ax'is (Cerras axis), a deer peculiar to Instance—makes its vibrations.

Axis Deen, ax'is (Cerras axis), a deer peculiar to India. It is about the size of the fallow-deer; its ground-colour is pale red; a white line rans along its sides, dividing the under from the upper parts of the body, which is prettily spotted with white spots. Hunting the axis is a favourite sport, and its flesh is esteemed

a great dainty.

ALLE-TREE, dx'-l-tre (Sax. ax, and tree), a piece of timber, or bar of iron, fitted for insertion in the hobs or naves of wheels, on which the wheels turn. Since the general use of locomotives, elaborate inquiries have arisen among engineers as to the theory of axles, Mr. Yorke, in 1843, contended for the superior strength of hollow axles; but his opinion is disputed by others. Among the recent improvements in form and mechanical action, may be mentioned Hardy's patent axles, which have shown such a remarkable degree of toughness that, in 1849, the privy council granted a continuation of the patent. In a treatise on railway axies, Mr. Bessemer attributes the cause why the axies of railway carriages break more frequently than those of a road carriage, in spite of the fact that the one go upon smooth rails while the other pass over rough and uneven surfaces, to the oscillation of a railway carriage, and proposes the use of a compound axle so formed that its two halves may yield a little during oscillation, Rowair's patent axles were invented to reduce the amount of friction usually excited by the action of the wheel. For the axle in common use is substituted a small centre-revolving arm, along which are fitted five or six rollers closed at each end: the shouth over the small roller revolves with very little friction. The arm is turned truly parallel, with a bevelled shoulder to fit a corresponding bevel on the rollers, and a screw-nut is fitted in the extremity of the arm, having also a beveiled shoulder. The rollers are fitted into and carried by two rings in such a manner that they are perfectly free to move on their centres, and, when placed on the arm, are free, also, to move round it without lateral motion, being confined by the bevels. By this contrivance the bearing is transferred to the

By this contrivance the bearing is transferred to the surfaces of the rollers, and does not affect their centres.

AXOLOTI, dx'-o-latt (Siren pixelformix), an amphibious animal, chiefly peculiar from possessing, at the same time and always, both gills and lungs, thus enabling it to breathe air and water, according to pleasure or exigence.

It is about 9 inches larger hand, broad a longer hand, broad and always.

thickly mottled with small black spots. The axoloti is very AXOLOTL. common in the lakes of Mexico, and, according to Humboldt, likewise inhabits the cold waters of mountain lakes at much greater elevation above the level

the tail long as

of the sea than the plains surrounding that city. Dressed after the manner of stewed ecis, it is sold commonly in the market-places of Mexico. Axотомога, äx-ot'-n-mus, in Min., a term applied to

minerals cleavable in the direction of their axis.

AXE-AXE, ai-ai (Cheioromys madagascariensis). --This animal, in many accounts confounded with the ai,

or sloth, has lately attracted much attention, and is now regarded as a connecting link between the Rodents and the Quadrumana. When first discovered, it was supposed to be a species of squirrel. It burrows underground, and is altogether a nocturnal animal. It has large flat bat-like ears, and its tail is long and bushy.

AYE-AYE.

Each fore-hand has five fingers, the third being singularly attenuated, and provided with a strong claw. The hind-legs are also furnished with preheasile hands. The entire body is clothed with long smooth hair, beneath which is an under-coat of a woodly nature. It measures about eighteen inches from nose to tail, and is found only in the forests of Madagascar, where it feeds on worms and insects.

AVUNTAMENTO, a-joon-ta-men'-to, is the name given in Spain to the councils or governing bodies of the towns and villages. This has ever been the most cherished and carefully-preserved institution of the Spanish people; and its existence may be traced to the earliest period of their history. In 1512 much of its influence was lost, and under the Bourbous it was entirely taken away; but, in 1812, the leading features of the old system were rectored by the Cortes. On the return of Ferdinand VII. the synotamentos were abolished; but they were again restored by the Cortes in 1823. During the civil was they were once more set aside; but in 1837 the constitution of 1812 was restored. attempt made in 1840 to restrict their powers led to the expulsion of the queen; but the measure was carried in 1844, by which their functions are limited to municipal matters.

AZALEA, a-zui'-le-a (Gr. azaleos, dry, arid,-the habitat of the plant), in Bot., a gen. of plants belonging to the nat. ord. Ericacca, sub-ord. Rhododendrew, and consisting of shrubs remarkable for the beauty and fragrance of their flowers. Many of the species are extensively cultivated as ornamental plants: of these, the most common is A. pontica, a shrub from three to five feet high, with orange, red, or nearly white flowers. It is a native of the countries around the Black Sea, growing luxuriantly on the mountain-slopes, and often giving great brilliancy to the landscape. The whole plant is narcotic, and Trebizond honey owes its poison-ous properties to the bees feeding on the flowers. The poisonous honey mentioned by Xenophon in his account of the "Retreat of the Ten Thousand" was of a like nature. Some of the finest species in cultivation are natives of North America: of these, the most deserving of notice are A. maisflara, called, on account of its sweet odour, the upright honeysuckle, and A. viceosa, which, with A. pontiar, have become the parents of numerous beautiful hybrids. The delicate azulca of the greenhouse, A. indica, is, as its name implies, a native of India. This species has lately met with a rival in

#### Azimuth

A. lodifolia, an evergreen, which has been brought to this country from China. The azaleas are closely allied to the rhododendrons.

AZIMUTH, id-c-muth. (Arab. al samt, the way, tract, or quarter).—The azimuth of any heavenly body is the angular distance between the north or south point of the horizon and another point in the same, where it is cut by a vertical circle, or circle of altitude, passing through the heavenly body itself and the zenith of the observer. It is taken by aid of an altitude and azimuth instrument and a theodolite. The term azimuth circle is sometimes applied to vertical circles, the planes of which are perpendicular to the plane of the horizon. The magnetic azimuth is the augular distance between the point ir. the horizon cut by the azimuth circle of any heavenly body and the meridian of the magnetic pole. The sun's magnetic azimuth is found at sea by means of an azimuth compass. (See Compass.) An azimuth, or analemmatic dial, is one in which the dialplate is parallel to the plane of the horizon, and the gnomon, or stile, at right angles to it: the hour-points

are marked in the periphery of an ellipse.

Azonenzine, d-zo-bon'-zide, a substance obtained by the action of an alcoholic solution of potash on ni-It crystallizes in large reddish-yellow crystals. It must not be confounded with nitrobenzole or nitrobenzide, which is benzole in which an atom of hydrogen is replaced by an atom of peroxide of niatom of nitrogen only.

Azolitium, azolitium, the principal constituent

of litmus: it is amorphous, of a brown-red colour. is insoluble, or nearly so, in alcohol and water, but dissolves readily in ammonia.

Azore, az'-ote (Gr. a, not, and zoe, life), the old name for nitrogen. Nitrogen was so called from being destructive to life; but as numerous other gases have the same properties, the word has been almost given up by English chemists, except in such words as azolized, azolienzele, &c. The French, however, still use azole. azolique, azotate, &c., for nitrogen, nitric neid, and

AZIEC CHILDREN, äz'-tek .- In 1853 two children, a boy and a girl, were brought over to this country from America. Their ages were said to be respectively seventeen and eleven; but their appearance warranted a supposition of their being much younger. Their height was not three fort. Their figures were slight and well-proportioned, and their faces of remarkable peculiarity. Their foreheads and chirs receded almost abruptly, and their noses, which were of the Jewish type, were singularly prominent. Their eyes were dark and expressive, and their complexions a transparent olive-colour. They possessed from minul spirits, and were fond of music. They were exhibited to the public as curiosities, and attracted a number of spectators. They spoke no known language, but under-stood a few words of English. The exhibitor repre-scuted them to be descendants of the ancient Aztecs, and related a most improbable story of their having been stolen from the city of Ixamaya, where they were worshipped as gods. A Senor Velasquez, with a Canadian and an American, explored the interior of a portion of Central America, where they formed the acquaintance of the priest under whose guardianship these diminutive deutes lived. This priest was so impressed with the tales told by the travellers of the wonders of the exterior world, that he resolved to carry off the gods of his country. The priest, the Canadian, and the American either perished by the way, or were lost in the forests, and Velasquez alone ways of the carry of remained to tell what story he pleased, without the fear of centradiction. Professor Owen pronounced lear of contradiction. Processor Owen pronounced the two singular specimens of immanity to be merely dwarfs, or monstrosities of Indian parentage; and this opinion becoming general, all interest in the exhibition of the Ixamayan child-gods cused. They returned to London in 1887, were married, and were exhibited found in 1887, were married, and were exhibited

London in 1867, were married, and were exhibited afresh. (See Mexico, Anviquities of.)

Azura, d'-zhave (Fr., light blue), in Paint., a skycoloured blue. The colour made of lapis lazuli, called ultramarine, is held in great estimation by painters.

—In Her., a term used to denote the blue colour in armorial bearings. guished by parallel nes crossing the field or charge

## Babel, Tower of

in an horizontal direction. The old heralds considered it the symbol of truth and constancy.

AZURE-STONE. (See LAPIS LAZULI.)

AZURE-STORE. (See Maris Lazoni.)
AZURETR, distinct, a mineral found in mica-schist, so named from its colour. It is also called lazulite, from its faint resemblance to lapin lazuli, with which it must not be confounded. It consists of phosphate

It must not be conformed. It consists of phosphase of alumins, magnesis, and protoxide of iron.

AZY608, az-c-gos (Gr. a, not, and zagos, a yoke), in Anat., is applied to certain parts of the human body that have no yoke or fellow,—that, in other words, are

B, the second letter in the alphabet of all European and most other languages. It belongs to the order of labials; so called because the lips are the principal organs employed in their pronunciation, and it is the medial letter of the order. It is closely alied to the other labial letters, p and v, with which it readily interchanges. In modern Greece, Spain, and some parts of France, b is pronounced like v; and hence the sareastic remark, that in Gascony vivers (to live) and bibere (to drink) are the same thing. As a numeral, B was used by the Greeks and Hebrews to denote 2; but among the Romans it denoted 300, and with a dash over it, 3,000.

BAAL, bai'-al (Heb., lord, owner), a god of the Chaldeans, Babylonians, and Phoenicians, and, indeed, the principal deity of many of the Oriental nations. Israchics often abandoned the worship of the true God to adore this idol. Incense was the offering most commonly presented; but we read in the Bible that human sacrifices were sometimes made to him. There were a number of idols of a secondary rank bearing the name of Band; such as Band-Berith, "the covenant lord." a divinity of the people of Sechem; Band-Peor, the Pringuts of the Midianties and Moshites; and Bandzebub, the Philistine idol at Kiron.

Bunk halds is a Tookish we 3 change in the Moshites;

Bana, ba'-ba, is a Turkish word, signifying 'father.' In Persia and Turkey it is prefixed, as a title of honour, to the names of distinguished ecclesiastics. It is often also annexed, by way of courtesy, to the names of other persons; as Ali-Baha.

Banning Thrush. (See Thrush.)
Bannin, Towm or, bai-bet (Heb. babel, confusion).
The descendants of Noch, hoping, probably, to make a place of refuge for themselves in case of a second a place of relugo for themselves in case of a second deluge overspreading the earth, are mentioned in Genesia xi. as building this tower of brick, cemented with biturations slime, in the plains of Shinar, in the year 2247 n.c. The Almighty, to punish them for their act of impiety, and their want of faith in his promise that he would not destroy the world again by water, confounded their language, so that the words used by the men of one purty became utterly uninteligible to those of another. A separation of the different groups immediately took place, and in this is found the origin of the various nations that are so widely spread over the cartify surface. Eastern trawidely spread over the earth's surface. Eastern tra-vellers have assigned the position of the Tower of Babel to three different masses of ruined brickwork in the plains of Babylon. Two of these are near the town of hillsh, on the Euphrates, which is supposed to be built on or very near the site of ancient Bahylon, namely, the Birs Nonroud, six miles to the south-west of the town, and the Mujellibe, five miles porth of it, and rather more than half a mile from the Euphrates, on its east bank. The third place which claims to represent it is the tower of Nimroud, near Akkerbuf. majority of those who have made researches in Babylonia are in favour of the Birs Nimroud. The superstructure stands on an immense platform, similar to those usually constructed by the Assyrians for the elevation of their public buildings, which bears traces cleration of their public buildings, which bears traces of the destructive influence of time and long exposure to the elements. It is built of fire-baked bricks, well cemented together, and is oblong in form, measuring about 70° yards round the base. The height on the eastern side is reduced to about 60 feet; but on the west it is about 20° feet high, towering upwards in the form of a cone; and on the top of this is an irregularly-

#### Babiana

shaped mass of brickwork, separated by rents and fissures extending from the summit to its base. Huge bricken fragments, rent from the original building, and bearing the appearance of having heen subjected to the action of flerce heat, lay in confusion on all parts of the mound, which has led Sir R. K. Porter to the conclusion, that the destruction of the tower was effected by means of lightning from heaven. It is supposed that a temple, in honour of Belus or Nimrod, was built on the remains of the Tower of Babel, which has in turn met with total destruction, and added to the

has in turn met with total destruction, and added to the ruins which encumber the platform.

Bablara, hab-ed-nd, in Bot., a gen. of plants belonging to the nat. and Iridaces, and including numerous species, all natives of the Cape of Good Hope. The name is derived from Bablanes, a word employed by the Dutch colonists to distinguish these plants, because their round subterraneous stems are greedily devoured by baboons. The leaves of all the species are narrow, plaited, and sword-shaped; the flowers are very similar to those of the gen. Gladiolus, and are usually yellow,

but sometimes purple, or even scarlet.

Babool, bd-bool, the Indian name for the astringent barks of the Acacia arabica and A. Catechu. (See

ACACIA, CATECRU.)

BABOON, bd-boon' (Fr. babouin) (Cynocephalus), a gen.
of Quadrumana, in which the tail is always short and often radimentary; the nose is prolonged uniformly with the jaws, and the nostrils open at the end of it, exactly as in the dog. Indeed, in shape of head, the resemblance the baboon bears to the dog is its chief distinctive peculiarity. It has a long and truncate muzzle, tive peculiarity. It has a long and truncate muzzle, obeck-pouches, and sharp claws, and is certainly the fiercest and most repulsive of the Quadrumana. The common baboon (Cynocephalus papio) is a native of the coast of Guinea. It is of a uniform yellowish brown colour, with a shade of light red on the head, shoulders, and extremities, the face, ears, and hands being naked, and entirely black. It is furnished with whiskers, which have a beckward direction but do not conveni which have a backward direction, but do not conceu the ears. The variegated baboon, or mandril, is the

BARGON.

most remarkable of the genus. The head of this creature is grotesquely large, its face long; it possesses scarcely any forehead, and its snout is blunt and abrupt. The eyes, which are very small, are sunk deeply in the head, and the cheek bones very prominent, and inted with violet, purple, and scarlet. The hear rises above the forehead to a peak; and beneath the chin there is a small beard of orange-colour. Round the back of the neck the hair is long, and inclines forward. The hinder parts of the animal's body, commencing from the loins, are marked with a soft violet, which gradually expands to the most vivid red; and very singular does its little stumpy tail look, sticking bolt upright in its orimson setting. Many years ago a mandril was kept at Cross's menagerie, in London. "Happy Jerry" the brute was named; and it was taught to simulate a relish for tobacco and beer. This animal ever retained its natural ferocity with was taight to simulate a reism for conscount need. This animal ever retained its natural ferrocity with the city, as it has been handed down to us by the strangers, but was particularly sociable with its Greek historians Herodotts and Diodorus and the keepers. "Happy Jerry's" stuffed skin now adorns the British Museum. Besides the baboons mentioned, been founded by Belus or Nimbod; but Semiranis, 176

# Babylonian Architecture

there are the solada of Abyssinia, the chacms of the Cape of Good Hope, and several others.

BANYLOWIN ANTIQUITIES, bāb-s-lo-se-ān. — The archaeological remains of the ancient and powerful kingdom of Babylon, except those of their architecture (see BANYRONIAN ARCHITECTURE), are but few in number, and of a nature that tends to throw but little light most the history manners and cratters of light upon the history, manners, and customs of a people that once hold predominant eway among the nations of the East, an account of which is chiefly gathered from the historians Josephus and Hero-dotus. The long level plains of the country, interdotus. The long level plains of the country, inter-sected by broad rivers that rapidly overflowed their banks when swollen by rains pouring from the moun-tain districts to the north, rendered it needful that the land should be protected from injury by lines of embankments, and irrigated at pleasure, to insure fertility, by means of canals and smaller artificial water-courses. Traces of these works are to be found in many places; but the most perfect is the canal now called Nahr-cl-Melik, which is supposed to have afforded a means of passage between the Tigris and Euphrates. It fell into neglect and disuse after the occupation of the country by the Saracens, in the 7th century. From the want of stone for building, few monumental records remain to the present day, with the exception of those that lie buried in the ruined masses of mouldering brickwork that represent the stately palaces and temples of the land, some of which stately palaces and temples of the land, some of which have been explored by Layard, Botta, and Rawlinson. Bricks have been discovered bearing names and inscriptions, and carved writings on tablets and circular pillars, in cunciform or wedge-shaped characters, which, when deciphered, afford scanty landmarks of the history of the monarchy during a long series of years. From these inscriptions, Sir Henry Rawlinson has ascertained that the Babylonians belonged to the Semitic group of nations, speaking an Aramaic dialect which much resembled the Syriac. Astronomical observations were taken and preserved at Babylon, some of which are recorded in the "Great Collection" of Ptolemy, and historical annals were written; but there is much that is uncertain and even mythical about Babylonish history, and the inscribed bricks and stones that have yet been found do not go far and stones that have yet been found do not go far to corroborate the long traditional lists of successive imperial dynasties that have been handed down to us. The Babylonians, like the Assyrians, attained a high degree of civilizatios, which brought about their ruin and final absorption into the Persian empire, by inducing habits of pride, effeminacy, and luxury. The government was carried on by viceroys, called satrups. There were three different courts of law for the dwe administration of justice. They carried on an extensive trade by land and sea with the surrounding nations, and Babylon itself was famous for the manufacture of richly-dyed cloths and carpets. They were an idolatrous people, chiefly worshipping They were an idolstrous people, chiefly worshipping the sun, the god Baal, and the goddess Baaltis, whose rites were similar to those performed in honour of Astarte, the goddess of the Phenicians. The Chaldeans formed a separate section of the nation, resemblished the Tairing and the Phenicians.

bling the Levites among the Jews; and to this body belonged the especial care of education and religion, and the advancement of the arts and sciences, which we may reasonably conclude had reached a limit cor-responding with that attained by their neighbours the Assyrians. (See Assyrian Sculpture.)
Barylonian Architecture.—The intimate connection between the countries of Babylonia and As-syria, and their respective capitals Babylon and Nine-

syria, and their respective capitals Babylon and Nineweh, caused a corresponding similarity in their architecture. The same kind of low massive buildings,
raised on artificial platforms that towered one above
another, connected with flights of broad steps richly
ornamented with sculpture, and adorned with magnificent gardens, replate with every flower, fruit, and
shrub that could be gathered from the fertile regions
of the East, characterized both. (See Assuman
Architecture). It will be sufficient here to give a
brief description of the general architectural design of
the city, as it has been handed down to us by the

# Babylonish Captivity

the queen of Ninus, who succeeded her husband on the throne of Assyria, was the real founder of Babylon, adding greatly to the city as it stood in her time, surrounding it with a wall, and building many splendid palaces and temples. Its grandeur was subsequently restored and greatly augmented by Nebuchadnezzar about 600 n.c. According to Herodotus, the city was square in form, with the river Ruphrates running through the centre of it. The circumference of the outr walls was 60 miles, which would make each side of fac city to be about 8 miles in length. The streets of me only to be monto makes in length. And streets in the centre were broad and straight, cutting each other at right angles, like those of many American towns in the present day. A bridge over the Euphrates conacted the two portions of the city on either side connected the two portions of the city on either side of the river. The surrounding walls were said to have been 360 feet in height and 75 feet broad, with 100 gates of brass at equal intervals. This statement must, however, be regarded with suspicion, particularly with regard to the great height assigned to the walls. The chief architectural points of interest in ancient Babelon surf, have the section of the points of the section and the section of the section and the section of the section of the section and the section of Babylon must have been the great temple of Belus, builton the ruins of the Tower of Babel (see Babel, Towns or), now called the Birs Nimroud; the Mujelibe, which has been conjectured by some to be the imperial citadel of the monarchs of Babylon; and the renowned Hanging Gardens, said by some to have been constructed by Semiramis, and, by others, to have been raised by Nebuchaduezzar for his queen Amytis. They were five in number, containing an area of about 20 acres between them. They were in terraces one 20 acres between them. They were in terraces one above another, sustained on arches and columns until they equalled the height of the walls of the city. Broad flat stones were laid on the tops of the arches, and these were in their turn covered with layers of bitumen and plates of lead, on which a considerable depth of earth was placed. The site of these gardens is supposed to be a mound on the east side of the river, called by the Arabs El Kasr. The bricks used in the various structures that adorned the city were better than those prepared at Ninevell, being hardened by fire in kilns, instead of being merely dried in the sun, and, in con-sequence, more durable, and better adapted to preserve names and inscriptions imparted to them while in a

BABYLONISH CAPTIVITY, a term applied to the compulsory residence of the principal families of the kingdom of Judah in Bubylon, under Nebuchadnezzar and his successors. In the reign of Zedekiah, king of Judah, about 600 n.c., Nebuchadnezzar first invaded the Jewish territories, and laid siege to Jerusalem. Retiring into his own country, he renewed the attempt to subjugate the Jews, 587 B.C., and succeeded in taking to unjugate the Jews, by: B.C., and succeeded in taking the city, and destroying the fortifications and the temple built by Solomon. Zedekiah had his eyes put out, and, with the chief of his people, was carried captive to Babylon. After the overthrow of the Babylonian empire by Cyrus the Persian, 536 B.C., the Jews were permitted to return to their native land, and the Babylonish captivity, which is reckoned to have lasted from the first invasion under Nelspeladarrae lasted from the first invasion under Nehuchadnezzar, was thus brought to an end. The Jews were not in a state of intolerable servitude during this period, but many of them rose to offices of high standing and honour in the court of Babylon, as may be learnt from the histories of Daniel, Esther, Mordecai, and

BABYROUSSA, bab - i - roos' - sa (Sus Babirussa) animal of the hog gen., found in a wild state in India and the Indian islands. The animal's chief peculiarity and the Indian islands. The animal's chief peculiarity is the possession of two protruding and curved tusks, turned upwards and backwards, so as very marily to describe a somicircle. The object of this peculiar arrungement is not known, though some of the older naturalists gravely tell us that the use of the tusks is to afford the babyroussa an opportunity itself to any convenient projection, should it faucy a quiet map. The same authorities, however, ascribe to animal quiet nap. The same authorities, however the horns of the chamois the same use. is still further distinguished from the common hog by its slender build and the fineness of the bristles that cover its body. It is said that, when closely pursued, the babyroussa will, without hesitation, take to the water, and, by alternately swimming and diving, speedily clude its enemy. Its food is vegetable, and

# Backgammon

its flesh, according to travellers, superior to dairyraised pork.

Bacca, or Berry, bak-ka, in Bot., a meny-seeded pulpy fruit, inferior (adherent to the calyx) and inde-asseem (not opening to allow the seeds to occupe). Assert (not opening to allow the seeds to escape). Examples may be found in the gooselerry and currant. The fruit of the grape is called a meadanium; but it only differs from the bacca in being superior (free from the calyx). The name bacca is applied by some botanists to any fruit of a pulpy nature.

BACCHAMAIA, bit-Manaid in a...—Festivals held at Rome in honour of Bacchus. The institution of these facets which were similar to the Direction?

feasts, which were similar to the Dionysia of the Greeks, was first introduced from Greece to Etruria, treers, was are introduced from trees to acturing and thence into Rome. They were held four times annually, and were originally only celebrated by women. The great amount of immorality and debauchery that soon characterized their proceedings called forth the intervention of the senate in the year. 566 A.U.C.; it was then discovered that more 7,000 persons had been initiated, and had bound them 7,000 persons and been initiated, and and sound themselves by oaths of secrecy. The Senate at once decreed that the saturnalia should be abolished throughout Italy, and the festivals were accordingly entirely suppressed in the year B.c. 186. (See Dionysta.)
Bachelon, bätch'-e-lor (Fr. bachelier, Lat. baccalau-

real), is one of those words of doubtful etymology which have given rise to many absurd conjectures. Among the various meanings of this word, it denoted, -1. those who cultivated certain lands, called baccalaria; 2. coelesiastics of a lower grade than the other nembers of a monastery; 3, persons of a military order inferior to knights, who, from want of age, poverty, or other cause, had not yet raised their banner in the field; 4. any young unmarried person; 5. an academical degree. As an academical title, it was first academical degree. As an academical title, it was first introduced in the theological faculty of the University of Paris in the 13th century, being applied to a candi-date who, having passed his examination, was entitled to lecture, without being of the rank of an independent docent or master. Afterwards the word was used in the other faculties as the lowest kind of academical honour. In many countries laws have been enacted against bachelors or unmarried persons. In Greece, by the laws of Lycurgus, and also by those of Solon, celibacy was regarded as a crime; and in Rome un-married persons were placed under certain disabilities. In this country taxes have been imposed upon bachelors and widowers, and married persons with children in some measure relieved; but more apparently with the view of raising money than from any other object. In 1695 an act was passed, entituled. "An Act for granting to his Majesty certain rates and duties upon marriages, births, and burials, and upon bachelors and marriages, for the term of five years, for carrying on the war against France with vigour." Bachelors above the age of 25, and widowers without children, paid is. yearly and upwards, according to their rank. In the tax on servants, first imposed by Mr. Pitt in 1785, and continued to the present time, a higher rate is charged for the servants of bachelors; and, in the income-tax of 1798 certain deductions were allowed to those who had children.

BACILLABIA, bd. sil-lair'-i-i (Lat. bacillum, littlestick), a gen. of Diatomacea (which see), consisting of silicious frustules of a prismatic form united into a brilliant chain, often in a sigzag manner. They form beautiful

microscopic objects.

Back, bak (Ang.-Sax.), is that portion of the human back, and (Ang. Car.), is that portion of the inflate body which extends from the neck to the loins, and includes the dorsal vertebres, the posterior portions of the ribs, and the muscles and skin pertaining thereto. Pains in the back may proceed from a variety of causes; as rheumatism, an affection of the spine, disease of the kidneys, &c.

Back AND Fill, in Mar., an operation generally restormed in narrow science by keeping the shin in the

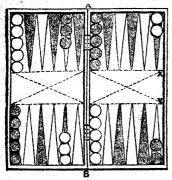

performed in narrow rivers, by keeping the ship in the middle of the stream, by advancing shead from one shore and moving backwards from the opposite shore.

Backgammon, būk-gām'-mon (Sax. bac, back, thid

game, a game), a game of chance, played by two players, with fifteen black and the same number of white pieces or men, on tables divided into twenty-four points. The movement of the pieces from point to point sergulated

## Backing Warrants

by casting dies alternately from little boxes, with one by casting dice alternately from little boxes, with one of which each player is provided. The arrangement of the board and places will be more readily understood by reference to the accompanying diagram, in which the men are set in readines to commence the game; the player using the black men being seated at the upper end of the coard, at A, and the one using the white pieces at B. It is the object of the player at A to get all his men into the section of the tables on is left hand, or "home," as it is technically called, and "bear" or remove them from the board in accordance with the numbers indicated by the succession and "bear" or remove them from the board in accordance with the numbers indicated by the successive casting of the dice, before his adversary can do the same, after getting his pieces into the section on his right. The dice are cubes, spotted on the sides from one to six; and, as they are thrown together, any

BACKGAMMON-BOARD.

combination of two numbers can be thrown, from two aces to two sixes. The terms for the numbers on the aces to two sixes. The terms for the numbers on the dioc are as follows:—1, ace; 2, deuce; 3, trè or tray; 4, quatre; 5, cinque; 6, size. If doublets are thrown, or similar numbers on each die, double the number of points are reckoned. Thus, if two cinques be thrown, twenty points are counted. The points on the hoard are counted from one to six in each of the four sections respectively, each player commencing from the point in the table opposite to him, on which two men are seen to be placed in the right of the diagram. Thus the player using the white men counts from the point marked X, and his adversary using the black pieces from the point marked Y. Two men can be advanced at once, one for each number turned up on the dice; or one man may be moved forward as many points as the numbers on the dice amount to taken together. When any point is covered by two of an opponent's men, the player cannot put any of his upon that point; but if one only be there, which constitutes what is called a blot, that man may be removed and placed on the centre dice are as follows:—1, ace; 2, dence; 3, trè or tray; 4. quatre: 3. sinque; 6, size. If doublets are thrown, that man may be removed and placed on the centre must be entered on any vacant point in the "home" section of the tables belonging to the opponent of the player whose man has been taken up, provided the number turned up on either die correspondents. point, and must then be brought round from the com-neancement like the men on the acc-points in either table. Towin a hit is to remove all your men from the table before your adversary has removed his: this counts one. To win a gammon, which counts two, is counts one. To win a gammon, which counts two, is to remove all your men before your adversary has brought all of his home; and if your men are entirely removed while your antagonist has one remaining in your home section of the tables, you win a backgam-mon, which counts three. The Welsh claim to have invented the name, deriving its title from the Welsh

# Baconian Philosophy

county from that mentioned in the body thereof, expowering the officer to execute the same in such other

County.

Backstaff, bdb'-steff, in Mar., an instrument used before the invention of the quadrant and sextant, for taking the sun's attitude at sea, and so called from the back of the observer being turned to the sun willed making the observation. It was invented by Captin John Davis, a Welch mariner, about the year 1500.

Back-staff, bdk-staff, in Mar., long ropes, extending from the top mastheads to the starboard and larboard sides of the ship, their use being to secondthe efforts of the shrouds in supporting the masts. They

larboard sides of the ship, their use being to secondate efforts of the shroulds in supporting the masts. They are usually distinguished into breast-back stays and after-back stays, the intent of the first being to sustain the mast when the ship sails upon a wind; the second to enable her to carry sail when the wind is further aft. Back-the-Cars, in Mar., to manage the oars in a direction contrary to the usual method, so that the boat shall move with her stern forward.

boat shall move with her stern forward.

Bacon, bail-kon (Sar. bacan, to bake, or Ger. bache, a wild sow), salted and dried pork, made from the sided and belly of a pig. The process of curing is effected by impregnating the flesh with salt, and allowing it to by impregnants the new with that, and another remain in the brine for some time. It is then taken out, dried, and smoked. Bacon-hams are the cured hind-legs. The working classes of England are more particular about the quality of the bacon they consume, and give a higher price for it, than the working classes of any other nation. York, Hants, Berks, and Wilts, are the counties most celebrated for bacon and hams in England; and Dumfries, Wigtown, and Kirk-cudbright, in Scotland. Bacon is largely imported into this country from the United States and the Hanse towns.

Baconian Philosophy, ba-ko'-ni-an, is that bys-

Francis Bacon, and which consists much more of a Method than of developed scientific results. If the experimental method which he introduced to the notice of the world was neither absolutely new, nor very directly useful, yet it possessed some really novel elements, and had the effect on his immediate suc-cessors of overthrowing the old methods of research, and thus of heralding a new ers of scientific discovery. The mind of this man (we speak not here of his moral character), as Lord Macaulay has felicitously physical it, was like the tent the fairy Peribanou gave to Prince Ahmed,—"fold it, and it seemed a toy for the hand of a lady; spread it, and the armies of powerful sultans might repose beneath its shade." If Bacon's Method has not proved quite so useful down to the present time as men might desire, they forget that the author of it had during his day no science exactly developed in the inductive method to act as a model to guide him in laying down his directions for future discovery. No doubt his conception of a scientific Method was magni-Scent; and the general rules, aphorisms, and wise reflections which dropped from his capacious brain, reflections which dropped from his capacious orani, have served as sign-posts to all subsequent explorers, which they have never ceased to quote with devout admiration. The importance of what Bacon did is not to be measured by his scientific discoveries, for he made almost none, but wholly and solely by the clearness and even novelty of his scientific method. The experimental method has been accused, both by Count Joseph de Maistre, therenowned author of the Soirées de St. Pétershourg, and by Lord Macaulay, in his celebrated Essay on Bacon in the Edinburgh Review, of being old, of being useless, and of being affoat in the being out, of being useress, and of being anoar in the scientific spirit of the age in which the philosophy appeared. Now there is a shade of truth, but nothing more, in the whole of these objections. To take up the first. No doubt the illustrious Albertus Magnus had previously insisted on some portions of the experimental method, and Bacon's great predecessor and namesake had done so, much more; but no man had, previous to his time, taken into account the radical difference which subsists between "simple enumeration," which belongs to every mind in the world, and the circumspect scientific method which alone renders merence when subsists between "simple enumeramode fack, little, and gammon, a battle. The etymords back, little, and gammon, a battle. The etylittle, which belongs to every mind in the world, and
had been enumeration," which belongs to every mind in the world, and
had back, little, and gammon, a battle. The etylittle, little, little,

on induction; but the only system contemplated by them was that which Francis Bacon denominates "inthem was that which Francis facon denominates "induction by simple enumeration," which consists in
setting down as general truths all propositions which
welhave found to be true in every instance. This is
the natural and instinctive action of every mind, as
we may easily ascertain for ourselves, by watching the
fall of the first person we meet. Now Lord Bacon's
method was altogether different from this. It consisted of a much wider and more circumspect way of verifying or a muon winer and more circumspect way of verifying scientific facts than had been disclosed to the world before. His method consisted of "interrogating" nature by observation and experiment; whereas the ordinary way in which induction was gone about previous to his time consisted in the "anticipation," previous to his time consisted in the anticipation, and, of course, in countless instances, the miscenception of nature. Man he proclaimed to be the "minister and interpreter of nature." in the first aphorism to his Movem Organium, which contains nearly all of his direct contributions to the science of method. He says, direct contributions to the science of method. He says, again (in Aph. 14), "A ryllogism consists of propositions, propositions of words, and words are the signs of notions; therefore, if our notions, the basis of all, are confused, and over-hastily taken from things, nothing that is built upon them can be firm: whence our only hope rests upon genuine induction." And this genuine induction he explains further on (Aph. 19): he says, "It constructs its axions from the senses and particular the constructs of the sense of t 15 constructs 16 axioms from the senses and particulars, by secending continually and gradually, till it finally arrives at the most general axioms, which is the true but unattempted vay. The uselessness of this method has been answered already; and the third objection, as quite valid, though a little captions, needs no rouly. Such than an the general descriptions. no reply. Such, then, are the general characteristics of the Baconian method of induction. A few words as to the details of this method. Before entering on the rules which he lays down for the guidance of future discoverers, he occupies a good number of aphorisms cuscoverers, no occupies a good number of aphorisms in enumerating the enuses of error. These idols (idols, Gr. eidola, which Hallam takes to mean a fulse appearance or divinity, while Playfair and the rest of them adhers to the ordinary meaning of the word idol be divides into four classes,—idols of the tribe, of the den, of the fewer and of the theory and the theory are the theory and the theory and the theory are the theory are the theory and the theory are the theor of the forum, and of the theatre. 1. The idols of the tribe are the causes of error founded on human nature rive are the causes of crist counced on numan nature in general. Among the idels of this class is the propensity which there is, in all mon to find a greater degree of order, simplicity, and regularity in things than an accurate observation will warrunt. To take an example:—As soon as men perceived that the orbits of the planets returned into themselves, they immediately jumped to the conclusion that they moved in perfect circles, and not in ellipses, as Kepler was the first to demonstrate. 2. The idols of the den are those which rise up from the peculiar character of the individual obup from the peculiar engracer of the nurvious operers, whether natural to him or acquired. Some minds are adapted to note the differences of things; others to eatch their resemblance. While one man carefully dissects everything to the minutest detail, another man, of a more active temperament, bounds off on the wings of a resemblance. They both err by excess; the cape by being too detailed the other by not being one by being too detailed, the other by not being detailed enough. 3. The idols of the forum are those which arise out of the forms of language and from the intercourse of society. Men believe that their thoughts always govern their words; but it often happens to be all the other way. This is provoking; for, words being to a large extent the formation of the rude multitude, we find, when we examine them, little of that delicacy and precision requisite for the processes of science.

4. The idols of the theatre are the deceptions which have arisen from the dogmas of different philosophical schools. This last class differs from the other three, inasmuch as it does not arise naturally and spontane ously in the mind, but must be acquired often at the expense of great labour and study. Having now completed these preliminary and very necessary cautions, he proceeds to describe and exemplify the nature of his poproceeds to describe and exemplify the nature of his peculiar method. Our first object, he says, must be to prepare a history of the phenomena to be explained, in all their modifications and carieties. This history is not to be without experiments instituted for the cake of discovery. Such a record of the phenomena of any occurrence he denominates its Natural History. This being ascertained, we must next entire to discover the cause or

form of these phenomena. The form of any quality in a body is convertible with the existence of that quality. Thus, if transparency be the quality which we are inquiring after, of course the form of this quality will exist wherever transparency is to be found. Cause differs somewhat from form in this way; that, while cause is only applied when we wish to speak of the cause having taken place form is explicit as while cause is only applied when we wish to speak of some change having taken piace, form is applied to any permanent quality. Two other subjects which Bacon discusses with considerable minuteness, are those of what he calls the tatent process and the latent schematism. We have an example of the former in the firing of a cannon. The short time that elapses be-tween the application of the match and the expulsion of the ball quantitates a latent process of a project tween the application of the match soft the expulsion of the ball, constitutes a latent process of a curious and complicated character. The latter, or the latent schematism, is the invisible structure of Bodies, on which so many of their properties depend. Thus, the internal structure of plants, or that of crystals, is the internal structure of plants, or that of crystals, is the internal structure of plants, or that of crystals, is the internal structure of plants, or that of crystals, is the internal structure of plants, or that of crystals, is the internal structure of plants, or that he calls "negative instances," or those cases in which the form inquired after does not appear. To take our former quality, that of transparency, he would tabulate such occurrences as the following in this inquiry. Pounded glass is not transparent, while glass unpounded is; collections of vapours are not transparent, while a single vapour is; and so on. After a great many exclusions vapour is; and so on. After a great many exclusions have been made, one of the remaining principles may be assumed as the cause in trying to investigate the origin of any process or phenomenon in nature. We are to reason from this assumed principle, and try if are to reason from this assumed principle, and try if it will account for the phenomenon. So important did this precess of exclusion appear to the mind of Bacon, that we find him saying, "It may, perhaps, be competent to angels or superior intelligences to determine the form or casence directly, by affirmations from the first consideration of the subject; but it is certainly first consideration of the subject; but it is certainly beyond the power of man, to whom it is only given to proceed at first by negatives, and in the last to end in affirmatives." Men can now preduct whereas, before, they could only vaguely guess. Such is a brief sketch of this wonderful experimental philosophy, which has transformed the world so far since Bacon's day. The benefits which it has effected for mankind, Lord Macsulay sum up as follows: "It has lengthened life; it has mitigated pain; it has extinguished diseases; it has increased the fortility of the soil; it has given new securities to the fertility of the soil; it has given new securities to the mariner; it has furnished new arms to the warrior; it has spanned great rivers and estusties with bridges of form unknown to our fathers; it has guided the thunderbolt innocuously from heaven to earth; it has lighted up the night with the splendour of the day; it has extended the range of the human vision; it has multiplied the power of the human muscles; it has accelerated motion; it has annihilated distance; it has facilitated intercourse, correspondence, all friendly offices, all dispatch of business; it has enabled man to descend into the depths of the sea, to soar into the descend into the dopths of the sea, to soar into the air, to penetrate securely into the noxious recesses of the earth, to traverse the land in cars which whirl along without horses, and the ocean in ships which sail against the wind. These are but a part of its fruits, and of its first-fruits. For it is a philosophy which never rests, which has never attained, which is never perfect. Its law is progress. A point which is never day was invisible is its goal to-day, and will be its starting-post to-morrow."

Bacterian Cone, bak-frian.—It must be first stated that Bacteria is the ancient name of a province now

BACTEIAN COINS, bak\*-fri-an.—It must be first stated that Bactria is the ancient name of a province now called Ballh, which is situated directly north of Afghanistan, and separated from it by the western part of the Hindoo-Koosh Mountains. It was a powerful country in the early ages of the world; but nothing certain is known of its history. When Alexander the freat overran Asia with his Macedonian and Greek troops, he established a Greek colony there, and fortified a city for its protection. Bactria was tributary to Dersia for fifty years after the death of Alexander; but was afterwards annexed to the great Syrian empire formed by Scleucus Nicator, about 312 2.C. The Greek clement infused into the province of Bactria by Alexander soon became predominant; and in the reign of Antiochus II., surnamed Thoos, which lasted from of Antiochus II., surnamed Theos, which lasted from 261 to 246 B.C., Theodotus, the Greek governor of the

country, threw off the yoke of the Seleucide, and established the new Greek kingdom of Bactris, seemd-ing the throne under the title of Theodotus I. The ing the throne under the tate of Theodotta I. The records of this comparatively new kingdom are as scanty as those of the ancient one. It was merely known to have existed for about 160 years, and then to have been overthrown by the Scythians, who took possession of the country. The discovery of some Bactrian coins, bearing dates of this period, in burial-bace in various parts of Afabraites 164 to a further places in various parts of Afghanistan, led to a further search, which resulted in the collection of many thousearch, whose resulted in the confection of many thousand pieces of money, from which lists of the Greek rulers of Bactris have been compiled by Messrs. Wilson and Prinsep. "The following is a list of the first six kings, who seem to have held the country under undivided control until 150 n.c.:—

	B.C.		
1.	258	Theodotus I.	
2.	240	Theodotus II.	
3.	220	Euthydemus.	

4. 190 Demetrius.

181—178 Eukratides
 155—147 Heliocles

From this time until the final subjugation of the country by the Scythians, the different Bactrian coins, bearing names of different persons exercising sovereign power at the same date, or within intervals of two or three years of each other, seem to indicate that the territory was either split up into independent districts, or that internal anarchy and dissension prevailed, and that the ambition of the leading men in the state led to a continual struggle for the sovereignty. The coins to a continual struggle for the sovereignty. The coins are divided by numismatists into two classes,—pure Greek, bearing legends in Greek letters only, including the coins of the first five kings given in the above list; and bilingual, or coins with inscriptions in Greek and and bungual, or come with inscriptions in Greek and Prakrit, a dislect of the Sanscrit language. Many of the bilingual coins are square in form; and the introduction of the elephant and elephant's head, and many regal emblems peculiar to India, show the evident decline of the Greek power, and the introduction of foreign influence into state affairs. There are only two gold coins of the Greek kings of Bactria known to have introduction of the Greek kings of Bactria known to

two gold coins of the Greek kings of Bactria known to be in existence,—one of Theodotus I., in the Imperial Cabinet of Paris; the other of Euthydemus. All the other pieces of money that have been found are in silver and copper, or billon, a mixture of these two metals.—Ref. English Cyclopadia—Arts and Sciences.

BACTRIS, bäk-tris, in Bot., a gen. of Palms, consisting of numerous species, all natives of tropical America. They are mostly small trees, with slender reed-like stems. The fruits, which are small, soft, and sub-acid, are greedily devoured by small birds. Tough fibres, used for making nets, are obtained from the stems of some of the species.

some of the species.

Baculium, a staff), in Geol., straight, many-chambered, conical shell, of the Chalk spoch. In its internal structure it resembles the ammonite. From its prevalence in the chalk of Normandy, that rock has been termed the baculite limestone.

BACULOMETRY, bak'-u-lom'-e-tre (Lat. baculus, astaff; Gr. metron, a measure), the act of measuring distance or altitude by a staff or staves.

BADGE, bidj, in Her., a mark of distinction or cognizance, assumed or conferred by royal authority. To the latter class belong the various emblems of the orders of the United Kingdom of Great Britain and Ireland, and other European countries, conferred by their respective reigning monarchs, and all marks of honourable distinction, such as medals, rib-bons, and crosses, given by the crown for military provess, or services rendered by any one to the state in a civil capacity. Under the former class may be reckoned the different crosts and distinctive bearings reaconed the americal crests and distinctive bearings assumed by nations, tribes, and families, in early and mediaval history, which can now be rightfully borne by a grant from the Herald's College only. The earliest mention of heraldic badges is to be found in the Bible, in which each of the twelve tribes of the children of Israel are spoken of under their respective cognizances: Israel are spoken of under their respective cognizances; such as the lion of Judab, the wolf of Benjamin, and the serpent of Dan. The eagle was the badge of the empire of Rome, and subsequent imperial dynastics have frequently adopted the royal bird as their distinctive emblem. The white horse, now borne in the royal arms of Hanover, was the badge of the Saxons; the

raven that of the Northmen and Danes. The white rose was the badge of the house of York; the red rose, that of the rival house of Lancaster: the Tador family combined the white and red rose, as emblematic of the upion of the antagonistic houses. A white hart with a collar round its neck, and a chain, was the badge of Richard II.; a boar, that of Richard III.; a crown in a thorn-bush, that of Henry VII.; the bear and ragged staff, that of the Nevilles, or house of Warragged stan, that of the Nevilles, or house of War-wick; the garb, or wheatsheaf, and sickle, that of the Hungerfords. The badges of the different orders of knighthood will be found under their respective head-ings. (See Bath, Onder of the; Garren, Onder Of the; Starop India, Order of the.) The badges of the United Kingdom of Great Britain and Ireland or the United Aingdom of Great Airdina and reasons are as follows:—England, a red and white rose, with the royal crown: Scotland, a thistle and crown: Wales, on a mount vert, a dragon passant, with uplifted wings, guies. The badge of the prince of Wales is three ostrich-feathers, with the motto "let dien." The serving-men and retainers of a lower class belonging to noble houses, and the coverage attached to continue. to noble houses, and the servants attached to gentlemen's families, usually wore their muster's crest or badge embroidered on the left arm of the blue cost. that was commonly worn in former days instead of the parti-coloured liveries of modern times.

BADGER, badj'-er (Meles Tuxus), a carnivorous quad-BADGER, budy or (Meter Turus), a carnivorus quadruped inhabiting most parts of Europe and Asia. The badger was classed by Linnæus among the bears, but very properly separated from that group by succeding naturalists. It is a slow and heavy animal, passing the day in sleep within its complicated burrow, and emerging at night in search of food, which consists indifferently of animal or vegetable matter. It is said sometimes to dig up wasps' nests; and Buffon, who mentions this habit, attributes it to the animal's fond-

BADGER.

ness for hovey; but as wasps do not collect honey, the great Frence naturalist is in error. The badger mea-sures shout two and a half feet in longth; its legs are very short, and its body flat; its eyes are very small; its neck short and thick; its tail stumpy; and its hide loose and tough. It was this last quality that in an-cient times recommended the badger to folks of brutal mind as a fit subject to pit against mastiffs. Badger-buiting used to be a very favourite sport in Eugland; and despiteits many disadvantages, the badger's strong jaws and loose skin made it a formidable antagonist jaws and loose skin made it a formidable antagonius for a dog. No matter what part of the hadger's body was seized, it could turn and fix its teeth in its assailant, and inflict on it a terrible bite. The fich of the badger is eaten in Italy, France, and China, and may be converted into hams and bacon. The skin, when dressed with the hair on, is impervious to rain, and is, therefore, considerably used in covering travelling-boxes. Its bristles are made into painters' brushes. hoxes. Its bristles are made into painters ornsness. To this family also belong the Ratels, or Honey-badgers. To this family also belong the Ratels, or Honey-badgers (Mellivera). The best-known species is the Cape Ratel (Mellivera capensis), which closely resembles the badger both in size and form, but is, perhaps, heavier in its appearance, and has the nose less developed. Its colours are grey above and black beneath. It burrows like the badger, not only to provide itself with a habitation, but also in search of the nest of the with a natitation, but also in search of the uses of lines wild bees, of whose honey it is passionately fond. It has the same loose hard skin as the European badger, and in this leathery armoured it is said to attack the citadels of these irritable insects with impunity.

Bagassa, ba-gas, a term applied to the refuse of

#### Baggage

the sugarcane, left after the expression of the saccha-rine juice. It is used as fuel in heating the boilers and

rine juice. It is used as not in heating the boilers and pans in the sugar-manufactory.

BAGGAGE, big-gay (Fr. bagage), in Mil., is a term applied to the clothes, tents, provisions, and other necessaries of an army. By the ancient Romans the haggage of an army was termed impediments, impediments or kindrances. The appeient soldier on the march was always heavily laden; and, in this respect, the ancient and modern avatems uresent a striking conmarch was aways nearly intent; and, in this respect, the ancient and modern systems present a striking con-trast to each other. The modern soldier is freed from every unnecessary enumbrance, and waggons are attached to each battalion for conveying the baggage. In our army, no private soldier is allowed to carry anything except what his knapsack and other accou-trements can hold, with the exception of shose that trements can and, what the exception of shose that are margined with consent, who are allowed one small chest each, of a fixed size, which must be carried at their own expense on a march. Staff and pay-sergeants are also allowed one small chest each.—Ref. Walshe's Military Cutechism and Handbook.

Reserve Landing (12s) keeps in a bath or bething

Waishe's Mittery Cutechism and Handbook.

Bachto, bust'yo [1sal. bagno), is a bath or bathinghouse. It is applied to the prisons in Constantinople,
where the slaves or convicts who are employed on the
public works are confined at night. The term bagnes,
applied to the convict prisons of France, is derived
from the same root. By older English writers bagno
is used for a house of bad fame.

Receive hat come a wind instrument of high

BAGFIFE, bigg-pipe, a wind instrument of high antiquity, in use with the Hebrows and Greeks, and a favourite piece of musical apparatus with the people of Europe during the Middle Ages. In Scot-land, where it is said to have been introduced by the

ITALIAN BAGPIPE.

the people. Under various forms, it is still played by the natives of Ireland, the south of France, Italy, Po-land, &c. The Scottish bagpipe consists of three parts; first, a leathern bag, which is inflated by means of a tube fitted into it, and stopped by a valve; secondly, four pipes, three called drones, and one the chanter, which latter has fingerholes, and upon which the melody is played. This latter alone emits the wind at the bottom and at the finger-holes. The three first-men-tioned pipes, all of which are tuned into a chord, are fastened

together in a fan-shape by cords or ribbons, and are so inserted into a socket as, when inflated, to lie up against the left shoulder and arm: from these pipes the wind passes out at the top. The third portion of the instrument consists of n sort of wooden nave or scoket, into which the (fixed) ends of the pipes are inserted, and to which the lower end of the bag is firmly attached by wrapping. There is a great dif-ference between the Scottish and the Irish bagpipe. The former is supplied with wind from the lungs of the The former is supplied with wind from the lungs of the playor; the latter from a small bellows fastened with straps underneath, and worked by, one arm, a tube passing from it in front of the breast to the bag, which is under the other arm. All the pipes in an Irish bagpipe point (alantingly) downwards, one of these having one or more keys upon it, worked by the wrist of the performer, so that the chord may be varied. The tone of the Irish bagpipe is low and sweet. In the Highland regiments of the British service, the bagpipe is played by pipers attired in their national costume. There are, also, certain Highland societies for promoting the skilful staying of the instrument. The namesed illustration will serve to show the form of the bagpipe played by reasants from the sense of the potential serve to show the form of the bagpipe played by reasants from the mountains before 181

#### Bailiwick

Within the last few years the instrument has likewise made its appearance in London, where it is played upon by certain picturesquely but dirtily-elad Italian rustics, called piffereri.

Baus, bdgs (Norm. bogs, a bag), in Mil. Mied with sand or earth, are used in field-fortification or other defensive works. Sandbags, which are generally sixteen inches in diameter and thirty high, and filled with sand or earth, are used to repair breaches in the embrasures of butteries when damaged by the enemy's fire or the blast of the guns. They are also placed on parapets, so arranged as to form a covering for men to fire through. Earth-bags contain about a cubic foot of earth, and are used in raising a parapet in haste, where the ground is rocky, or does not afford ready materials for that purpose.

raising a parapet in haste, where the ground is rocky, or does not afford ready materials for that purpose. BAOSHOT SANDS, big/ shot, in Gool... a series of lower tertiary beds, consisting chiefly of light yellow cands reposing on the London clay, and occupying extensive tracts around Bagshot, in Surrey, and in the New Forest, Hampshire. They correspond to the Brocklesham beds (which see).

BAIL, bail (Fr. bailler, to deliver), signifies the delivery of a man out of custody, upon the undertaking of one or more persons for him that he shall appear at day limited to answer and he instifled by the law

a day limited, to snewer and be justified by the law. In civil cases the bail may render their principal at any time; in criminal cases they cannot, unless he diy, or they have reasonable doubt that he will do so. In such case the defendant may be detained and In such case the defendant may be detained and brought before a justice, who may commit him in discharge of his bail, or put him to find now sureties. In civil cases, the bailing is by bond to the sheriff, or by consent given to a judge or commissioner; in criminal matters it is effected by entering into a verbal recognizance. In the former the bail are liable for the

recognizance. In the former the bail are liable for theamount of the debt, or damages and costs recovered;
in the latter, to the amount of their recognizance.

Batter, baile (Lat. ballium, probably a corruption of vallum, a rampart), originally meant an outer
bulwark, butcame afterwards to be applied to the area
or courtyard within one. It denoted the space inclosed within the walls of a castle. Where there were
double walls, the area between the two was called the
outer, the area within the inner wall, the inner bailey.

Batter, bailif (Lat. ballium; Fr. bailli), according
to Sir Edward Coke, is an old Saxon word, which signifles a keeper or protector; and although there are
several officers called bailifs, whose offices or employments seem quite different from each other, yet some-

several onicers cause boulps, whose onices of employ-ments seen quite different from each other, yet some-thing of keeping or protection belongs to them all. Hence the sherif is considered as builty to the crown, and his county, of which he has the care, and in which he is to execute the queen's writs, is called his bailwick, and the officers who, by his procepts, execute writs and other process, are called his builty. There are, likeand other process, are called his builty. There are, likewise, bailty of liberties, who are officers under lords who have franchises exempt from the jurisdiction of the sheriff. There are, likewise, bailty of lords of manors, who collect their rents, levy their fixes, attend their courts, and execute their warrants of seizure of eacheated property and heriots. There are also bailties of forests, and those to whom the queen's castles are committed; as, the bailtiff or constable of Dover castle. The chief magistrates in divers ancient corporations are also called bailty; as in Ipswich, Yarmouth, Colchester, and other places. In common parlance, is alliff is a person who has the management of an estate or farm, and superintends the same for the owner; and persons who are employed to distrain for rent are called bailty.

#### Railment

BAILMENT, bail ment (Pr. bailler, to deliver, or put into the hands of), in Law, is a delivery of goods in trust upon a contract, expressed or implied, that the trust shall be faithfully executed on the part of the bailee; as, if cloth he delivered, or (in legal dislect) bailed to a tailor to make a suit of clothes, he has it bouled to a tailor to make a suit of control, he man mupon an implied contract to reader it again when made, and that in a workmanlike manner; and, so, in the case of goods delivered to a carrier, or at some place appointed by him, for transit to a third party; and either generally or in a particular manner, an implied contract is raised that the goods shall be delivered accordingly. The varieties of bailner, an implied consultant and the varieties of bau-ahall be delivered accordingly. The varieties of bau-ments are so mamerous that it is scarcely necessary to define them. As to the liabilities of bailees, it may be taken as a general rule that where the bailment is for the mutual benefit of bailor and bailee, the latter is liable for negligence; viz., for the omission of that degree of care which a man of common prudence takes of his own concerns; secondly, that upon a bailment from which the balles derives no benefit, nothing short of gross negligence will make him responsible; thirdly, that upon a bailment for his own exclusive benefit, he will, on the other hand, be chargeable even for slight negligence; and lastly, that he is liable in none of these cases for a robbery or other casualty in no degree attributable to his own fault. A ballee has a qualified property in the goods transferred to him, against any stranger or third person. A ballee may have a general

BAINBERGS.

or particular lien on the goods intrusted to him. This subject will be treated under the word LIEN. BAINBERGS, bain'-bergs (Germ

bein, leg, bergen, to conceal), a term employed to distinguish the greaves worn over chain-mail armour as an additional protecarmour as an additional protec-tion to the leg. They seem to have been first adopted in the 13th century, as they do not appear in monumental effigies before that time. Their adoption led ultimately to the use of entire plate-armour. The illustration shows the mixture of plate-armour and chain-armour, and represents part of the capa-rison of a knight of the reign of Edward III.

un outer vessel

containing water, or some other fluid, in a state of coulli-tion: within this

BAIN-MARIE, bain(g)'-mare', a bath much used in oulinary operations in France, and so called from the name of the inventor.' It is also largely employed in chemistry, and mostly consits of

BAIN-MARIB.

is another vessubstance to be operated upon is placed. The object of the bain-marie is, to produce a gentle and regular heat, and it is principally used for evaporating or for distilling volatile and aromatic substances. When sand is substituted for brilling water, this apparatus is called a sand-bath, and when boiling water is employed, it is called a vapour-

bath. BATALM, bair'am, is the name of a Mohammedan festival which follows the Ramadan, or month of fasting, corresponding to our Lent. As the Mohammedans reckon by lunar months, this festival runs through all the seasons every thirty-three years. It commences with the appearance of the new moon of the month Shawall, and, as marking the termination of four weeks of fast-ing and restraint, it is looked for with great eagerness. At Constantinople it is announced by the discharge of guns and the sounding of trumpets and drums: the rejoicings usually last for two or three days. Another festival, called the Lesser Bairam, is celebrated 60 days after this one; but it is observed with much less ceremony.

#### Bala Limestone

Barting, boil-sing (Sax, buts, contention), is the act of smaller or weaker satimals attacking and harassing greater and atronger ones; as the baiting of bulls or bears by mastiffs or buildogs. Bull-batting was once a very favourite pastime in England; but the barbarity of the sport has led to its being given up in almost all olvilized countries, except Spain, where it is still very popular. The chief aim of the dog is to seize the bull by the nose, and to avoid being tossed by it. For this purpose, when properly trained, the dog creeps on his belly; while the bull endeavours to defend his nose by keeping it close to the ground, and attempts to toes the dog with its horns.

Baizs, bais (Ang.-Nor.), a kindof oarse open woulten cloth, with a long nap. It is sometimes frized on one side. It is without wale, and is wrought in about, like flannel. Edward III., in trying to stimulate the work irade of England, brought over a number of skilledworkmen from the Netherlands, and distributed them over the country. The various branches of the trade were confined to certain localities: thus the manufacture of

confined to certain localities: thus the manufacture of baize was restricted to the county of Suffolk, where it remained for some time. It is now principally manu-factured in and about Halifax, in Yorkshire. (See

BOULEN MANUFACTURE.)
BAJADERES, or BAYADERES, 50-ga-deers, a name given by the Portuguese to the singing and dancing-girls of Hindestan. They are of two kinds,—those who are employed as priestesses in the temples, and those who go about the country. The former celebrate with song and dance the festivities of the gods; the latter are employed by the grandees of India to delight and cheer them at their feasts.

BAKING, bai'-king (Sax. bacan) .- This term is applicable to almost any process of drying or hardening by heat; but is commonly restricted to the mode of cooking food in a heated chamber or oven. For making bread baking is resorted to by almost every section of the human race. It is also a common mode of dressing animal food; but is less effective than roasting, unless it be carried on in ovens through which air is allowed to pass freely. In reviewing the different modes of cooking meat, Lewes says, "Baking exerts some unexplained influence on the meat which renders it both less agreeable and less digestible. Those who have travalled in Correspond France must have represented. travelled in Germany and France must have repeatedly marvelled at the singular uniformity in the flavour, or want of flavour, of the various 'roasts' served up at the table d'hits. The general explanation is, that the German and French meat is greatly inferior in quality German and French meat is greatly inferior in quality to that of England and Holland, owing to inferiority of pasturage; and, doubtless, this is one cause; but it is not the chief cause. The meat is inferior, but the cooking is mainly at fault. The meat is scarcely ever roasted, because there is no coal, and firewood is expensive; the meat is therefore baked; and the consequence of this habitation is that the consequence of this habitation is that the consequence of this habitation is that the consequence of the conseque quence of this baking is, that no meat is entable, or caten, with its own gravy, but is always accompanied by some sauce, more or less piquant. The Germans generally believe that in England we est our beef and mutton almost raw; they shudder at our gravy, as if it were so much blood. I have ascertained that it is really the cooking, and not the meat, which is in fault; for, at the tables of great people, or resident English, where roast meat is served, the flavour is excellent.

In the inferior cating-houses, the meat is also

baked, for the sake of economy, and is notoriously deficient in that agreeable flavour which roast meat deficient in time agreeame navour which access horse possesses. If it were baked as thoroughly as it is in Germany, the meat in such eating-houses would be as tasteless."—Physiology of Common Life. Meat cooked in the improved ventilating ovens which have lately been introduced has all the sapidity and digestibility of meat mark. In fact the mode of condition by means. of roast meat; in fact, the mode of cooking by means of such ovens is now generally distinguished as ossaroasting. (See Oven.) The baking of bread, and the most important baking processes in the useful arts, are alluded to in other portions of this work. (See Regis, R

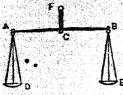

are alluded to in other portions of this work. Love Bread, Bricks, Pottern, Stoneware.)—For recipes in baking, see Mrs. Beeton's Household Menagement.

BALEMA. (See Witald.)

BALA LIMESTONE, ba'-ta (from Bais, in Merionethshire), in Geol., a series of limestone bets, alternating with slaty shales, constituting a portion of the Lower Climan formation of Walance. Silurian formation of Wales.

# Balance of Trade

Balance, ball-case (Fr. balance; Sp. balanca), a instrument for determining the relative weights bodies. There are neveral varieties. The ordicristian. The ordi on the first lead (see Lowes), which is called the beam (A. C. B.), with its follows (C) in the middle, and two scales (D and B) suspended, one from each extremity of the beam. The substance to be

weighed is placed in one scale, and the counterpoise, usually consisting of metal weights, in the other, the in-strument being susended from a ring immediately bove the fulcrum In the most delicate balances of this de-

scription, the ful-crum consists of a BALLECE. steel prism, which traverses the beam, and rests with its steel prism, which traverses the beam, and rests with its sharp edge upon two supports, formed of agate or polished steel; moreover, a needle or pointer is fixed to the beam, and oscillates with it in front of a graduated arc. If the two arms of a balance be not precisely of the same length, the scale appended to the longer arm will turn with a less weight than that hanging from the shorter arm; so, also, if one arm of the lever be heavier than the other, the scale on that side must preponderate. With such an imperfect pair of scales, however, the true weight of a substance may be ascertained, by weighing it first in one scale and then in the other, and deducting from the greatest weight half the difference deducting from the greatest weight half the difference of the weights indicated. The chemical bulance is an instrument of extraordinary delicacy. It is merely a pair of scales made with the greatest possible precision and accuracy, and is used for weighing portions of sub-stances separated by analysis. It is also used to weigh bodies to be united by synthesis. The whole theory of modern chemistry may be said to rest upon the per-fection to which the chemical balance has been brought. It is as necessary to the chemist as the transit-instrument and telescope are to the astronomer. Being so important and delicate an instrument, it is one of the important and delicate an instrument, it is one of the most difficult to use, the slightest carelessness being sufficient to nullify an observation made by its means. It consists essentially of the beam, the fulcrum, the joints of suspension, and the pans. The beam is generally made of brass, in the form of a long rhomboid. At an exactly equal distance from each end is fixed the fulcrum, which is generally a steel knife-edge, supported by agate planes. A contrivance is used for raising the beam, so as to keep the fulcrum from resting on the planes of support when not in use, in order to prevent the possibility of the knife-edge becoming worn. The object of having a sharp, hard knife-edge to prevent the possibility of the knife-edge becoming worn. The object of having a sharp, hard knife-edge resting on hard planes is to decrease friction as much as possible; it being obvious that sensibility increases as friction diminishes. The fulcrum should be fixed just above the centre of gravity, yet not too much so, so, the greater the distance between it and the fulcrum, the greater will be the stability of the balance; or, in other words, the balance will be less sensible, from the greater difficulty with which the beam is moved. Most balances have a contrivance for raising or lowering the centre of travity. The points of susfrom the greater difficulty with which the beam is moved. Most balances have a contrivance for raising or lowering the centre of gravity. The points of suspension are at each end, and are formed of hard steel knife-edges, working on agute planes, as in the case of the falterum. The points of suspension must be at absolutely equal distances from the fulcrum, otherwise, according to the properties of the lover, the weight indicated will be different in each pan. The pans are generally coated with platinum, to avoid corrosion, and are suspended by aller wires. To the centre of the beam is attached a needle index, which indicates the equality of weight in each pan by the equality of its vibrations on each side of the centre of a scale placed behind it. In some balances an index is fixed on the end of the beam, and viewed through a microscopu in its passage upwards and downwards over a fine scale attached to a fixed arm at a little distance from it. The whole is inclosed in a gless case, to preserve it from the action of passe or dust. Caustic lime is al-

rays placed inside the case, to absorb any musture that might astile on the working parts of the belance. Balances have been brought to marvellous partscion by Remadea, Kater, Robinson, Certing, Saors, and others. M. Stas, in his researches on the etc-mic weights of certain elements, employed a balance made by M. Saors, which turned with the ten-millionth part of the weight in each pan. Another, used by the same philosopher, weighed true to the two-thousandth of a grain. The weights used in such balances are made with the same precision: they will be described under WEIGHTS. A small piece of platinum wire, called a rider, sides along the beam, which is graduated, and indicates by its position a very small weight, on the principle of the steelyard; thus obvisting the necessity of using weights that are almost invisible 

ence as would endanger the independence of the others. In order to maintain this balance of power, it is not necessary that there should be anything like an equality among all the different states. It is generally sufficient that a few of the leading powers counterpoise each other; and in this way the safety of the smaller states is secured, as none of the officer would be disposed to allow its rival to add to the power by absorbing any of those minor states. We find the states of anoient Greece frequently guided in their statement by a combined the states of anoient Greece frequently guided in their statement by the states of anoient Greece frequently guided in their statement by a combined the statement of the statement of power among them; but it is only in modern times that the principle has come to be distinctly recognized and acted moon. In Europe it first became a distinct object of policy in the early part of the 15th century among the numerous small states and republics in Italy. Their justicusy of each other made them watch with the greatest keenness every movement or measure which might tend to increase the power of their neighbours; and, from a every movement or measure which might tend to increase the power of their neighbours; and, from a constant attention to this principle, they were able to maintain peace and general independence. When Charles VIII. of France invaded Italy, in 1494, Germany and Spain entered into a confederacy with the Italian states against him; and "from this era," says Ferguson, "we can trace the progress of that intercourse between nations which has linked the powers of Europe so closely together, and can discern the operations of that provident policy, which, during peace, guards against remote and contingent dangers, and in war has prevented rapid and destructive conquests."

The attempt to maintain the balance of power amour war has prevented rapid and destructed conquests. The attempt to maintain the balance of power among the different states of Europe has doubtless caused some wars, but it has unquestionably prevented more. It is this that has led to that great confederacy that exists among all the states of Europe, and keeps in exists among all the states of Europe, and keeps in awe the ambitious designs of any one of them that might desire to encroach upon the rights of its neighbours. At present the balance of power in Europe is principally maintained by the five great powers. "The grand and distinguishing feature of the balancing ayetem is the perpetual attention to foreign affairs which it inculcates; the constant watchtulness over every nation which it prescribes; the subjection in which it places all national passions and autipathies to the fine and delicate view of remote expediency; the uncassing care which it dictates of nations most remotely situated, and apparently unconnected with ourselves; the general union which it has effected of all the European powers, obeying certain laws, and actuated

the general union which it has effected of all the European powers, obeying certain laws, and actuated in general by a common principle; in that, the right of mutual inspection universally recognized among civilized states in the rights of public envoys and residents."—Brougham's Colonial Policy.

BALANCE OF TRADE, in Com., denotes the difference between the aggregate amount of a nation's experts and imports, or the balance of the trade of one nation with another. The theory of a balance of trade is founded upon the position, that a nation can only be enriched by an excess of its exports above its imports, which must be reselved in money; and that unless the money thus acquired shall be retained in the country.

193

# Balance of a Watch

it might as well not have been imported. The theory it might as well not have been imported. The theory is founded upon the assumption, that, the precious netals alone constitute the wealth of a country; and hence, that when the moneyed value of the import of any country exceeded that of the exports, the country is so much a later by trade. This theory received the sanction even of Lord Pason, who, in speaking of the trade of England with foreign perts, says that case must be taken "that the exportation exceed in value the importation; for them the balance of trade must be received by the returned in coin or bullion;" and a sity be returned in coin or bullion;" and a large proportion of the restraints imposed on the free don of commerce during the last three centuries grew out of this notion. The Prohibition Act, 1 Will. & Mart, by which the trade with France was declared to making by when the trade with rende was declared as a satisfact, was founded on the fact that the value of the imports from that kingdom considerably exceeded the value of the exports. The balance was termed a the single from that kingdom considerably exceeded the value of the exports. The balance was termed a frient paid by England to France; and it was sagacrossly asked, what had we done that we should be obliged to pay so much money to our deadly enemy? Sounder views now prevail on this subject, and national wealth is not judged merely by gold and silver, which indeed are nothing but commodities, like other articles of trade. But the theory is erroneous, not merely from the false notions entertained of the nature of money which also from the idea that excess of exports is money, but also from the idea that excess of exports is excess of income. The value of the commodities imported by every country which carries on an advan-tageous trade invariably exceeds the value of those which she exports; otherwise there would be no fund whence the merchants and others engaged in foreign trade could derive either profit or return.—Ref. McCullock's Commercial Dictionary.

BATANCE OF A WATCH.—The movements of a watch are governed by a wheel called the balance, to which a vibratory motion is given. This wheel is impelled in one direction by the crown-wheel of the escapement (which see), and in the other by a fine spiral spring. The balance-spring, as this latter portion of the machine is called, consists of a coil of steel wire so delicately manufactured that 4,000 of them scarcely weigh more an ounce. As the rate of vibration greatly depends on the dismeter of the balance, marine chronometers, and some of the finest watches, are furnished with compensation balances, which do not increase in diameter with increase of temperature. In the compensation balance, the circumference of the wheel is made of two metals the orrentmerence of the wheel is made or two means having different rates of expansion, fast soldered together, the most expansible being on the outside. The compound ring is out through in two or more places, and is weighted at opposite points. When exposed to a high temperature, the ring expands, but, owing to the unequal dilation of the metals, each segment assumes unequal mustion of the metals, each segment assumes a sharper currie, whereby its centre of gravity is thrown inwards, and the expansive effect completely compensated. Under Mr. Dent's patent, both balance and balance apring are occasionally costed with gold by the electro-metallargic process.

Balancias, bdl'-da-sers, in Orn., a term applied to

DADANCES, our-un-ser, in Orn., a term applied to two slander membranous appendages, inserted on either side of the instathorax of insects belonging to the class Dispers. They are always small and movatle, and vary much in size and form, according to the class of insects by which they are possessed. They usually consist history are always to the class of insects by which they are possessed. amouse by mann may are possessed. They usually consist, however, of an elongated style with a small rounded head. Entomologists differ greatly as to the use of these organs. It is generally believed now, that they are the representatives of the posterior pair of wings, and are attached to the true metathorar. This, the same of the different has a manner of the posterior pair of wings, and are attached to the true metathorar.

#### Baldachin

the seeds, which yield, by expression, a fixed oil called seeds. The leaves are nightly acid, and are reputed to be authennance. The finite when maripe are bitter and yengative, but when rips, are exclude.

Balanwinous are, bit-deap-brut-see, to Bot, a nat. ord of disovyledmone plants in the sub-chass Monochlamptoe. These plants are parasites, and are found growing on the roots of various woody plants, especially in the tropical and sub-tropical mountains of asia and South America. They have no leaves; their stoms are of various colours, but never green, their peduncles are naked or scally, bearing spikes of flowers, usually white. Dr. Hooker saumerases thirty-seven species, which are divided into fourteen genera. Many are remarkable for their astringent properties; others are edible, and a few secrete a kind of wax. Two plants of this order are worthy of note; namely, Ossoscrino of this order are worthy of note; namely, Ossoscrino yalued as a styptic; the second yields large quantities of wax, which is used for making candles by the inhabitants of New Granada.

Balantius, bid-lim-ti-us, in Bot., a gen. of ferns.

BALATTIM, bid-lin'di.um, in Bot., a gen. of ferns. The species B. chrysotrichum is a native of Java, and furnishes the silky hairs which are imported under the name of Pakoe Kidang, and occasionally used as a styptic.

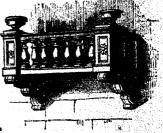

styptic.

Balansra, hi-laws'-ti, in Bot, the name given to a kind of fruit of which the pomegranate is the only example. It is inferior (i.e. adherent to the calva) many-celled, many-seeded, and indehiseent, said has a tough rind. It is formed of two rows of carpets placed. tough rind. It is formed of two rows of campels placed above each other, and surrounded by the calve; the seeds are attached irregularly to the walls or centre.

Balcony, bal-ko-ne (Ital bateo or patos, the box of a theatre), in Arch., a projection in front of the windows.

windows of

a house, supported on brackets of wood or stone. floor of the balcony is generally level with that of the room, and the windows reach to the ground, and open folding-

SALEMAN . .

name to a celebrated west cod polis,—Pall-Mull. The ball is ways; such as being kicked by bat, thrown by the hand. GoLF, &c) BALLAD, ball-lad, the name w

Ballad, bill-idd, the name mans comple versified parasive, whether a often rude in style, adapted to be a panied by an instrument. It is thus to of one poetry, and from its peculiar handling, it belongs to the lyrical of (See Eric and Lyric) It is sensely mous with song, but the latter word employed, is always applied to a ly while the ballad has always womentamy or epical in it The word is considere or epical in it. The word is quasicous its original signification. At first the of Italian origin (bollats, Med. Lat. bullissin, to dance), was applied to a linded, the word has been used in its very loose and vague way. How thesis or the contract from a company to the contract of the were properly known as romances. Spain, again it was used to designs Spain, again it was used to designate only and again, lyrio-cepic, which is these designation and again, lyrio-cepic, which is the season in proper application. There is one general distinct which runs through the whole of the balled peak the European nations. This is the natural distinct which invariably occurs, almost as exactly as the tide of the places, or the thermometric indicates chimate, by which the lyrical or sunny almost dominates in the balleds of Italy and Spain, what those of the north, the gloom of the atmospheric seemery has transferred itself to the afficience of people, and rendered their bulleds much more opining and the state of the state o the Scandinavians and the Scotch, for exa is planty of conneality in their balled postry; but at is generally of a grin, and even wild humour; but deriving much more on the realms of tracedy them among the southerns. There can be no doubt that hadded have formed the first rude attempts at very among all nations, and that the earlier heroic posma, or even epics, such as those of the Spanish Cld, and the Mibelingen Lucd of Germany, grew out of some such simple beginning. Old Fleisher of Saltons and if he were permitted to make the balleds of a nation, he salted not who should make its laws (Political Works, 1749), so strong a balled had he in the revolutionsming Emdency. permitted to make the halladis of a makion, he seited not who should make its laws (Political Westes, 1749), so strong a belief had he in the revolutionsing isodemey of an kerose ballad or song. The northern Seales, the Scottish and English mustires, said the contraction of the word lay itself (Cier, Ruch) was long applied to such composed herois balladis, or shaped lays of love. The word lay itself (Cier, Ruch) was long applied to such compositions in degraining, before the Italian word ballad came into nearmons with the word ballad nan been used shaped which was long applied to word to the true of the little of the word ballad has been used shaped which have on Song Writing (London, 1770), sees, "The nature on Song Writing (London, 1770), sees, "The nature poetry of the country was reserved meraly for the humorous and burlesque, and the term ballad was brought by outcom to agnify a connectory, toke in low, familiar language, and accompanied by a droit tervial time. This occurred about the period known as the Restoration, hetween the reign of Charles II. sand the times of Theorem and the least greening allowed among well-read men, that the best specimens known of the old popular ballad are to be found in Sectional, or more properly, perhaps, along the Section should be the or the sandject, that many of these stratisticates where on the sandject, that many of these stratisticates, and the surrent all giver the knagdom of Sections. No doubt,

Balliol College

in numerous instances, these old ballads had their integrity tempered with, and they were not transmitted from one generation to another without innumerable transformations. A large proportion of them have doubtless been preserved by trail tradition, and during every successive stage which the race mide in advancement, one could trace this progress in the very ballads which they had transmitted by the linguistic changes which their speech had undergone. To take a single example, almost overheady believes that "that grand old brilled of Sir Patrick Spens," as Coleridge called it, derived its origin from a very carly age; and yet it is remarkable the number of variations to which it has been subspicted. Any one can easily satisfy himself on this point by a comparison of the different versions of the siefs, and Avioun's; and yet a sagacious eye will have very little difficulty in detecting the granue old composition from its more modern and spurious interpolations. position from its more modern and spurious interpolaspuriousness becomes, in the region of these old balleds, more a problem for personal ingenuity than for anything more solid. For aught we can tell, the original forms of those old compositions may have coriginal forms of those old compositions may have been the gradual accretion of centuries, and of various suthors, rather than the production of any single individual. Very likely, every one of them is not only of diverse authorship, but various hands may have touched up the different poems, each according to his fancy. The English Robin Hood ballads are another instance in point. Nobody at the present day can say when or where, or by whom, those rich old have according and well there even be no doubt. can say waren or where, or by whom, those her our hays were trainsmuted; and yet there can be no doubt that they have been so. "Fair Helen of Kirkconnel Leag!" an old Scottish ballad, presents as much of the elements of true tenderness and wild possion as we can find in the whole range of modern poetry. "Chery Chase" and the "Battle of Otterburne" are epi-Chase and the Battle of Otternine are epic narratives on a much larger scale than usual. "Adam Bell," and "Clim o' the Cleugh," and "William o' Cloudesley," stand between the latter poems and such simple ballads as those of "Johnny Armstrong" and "Edom o' Gordon." The earliest English ballad new "Edom o' Gordon." The earliest English ballad now remaining, according to Ritson, an excellent authority, is a "Cuckoo Song" of the latter part of the reign of Heary III., beginning, "Sumer is icumen in, Linde eing cuocu." The earliest specimen of the Scottish balled, after that nation became English-speaking, is given in the "Rhyming Chronicle" of Andrew Wyntoun, prior of Lochieven, about the year 1920, in which he relates the song that was made on Alexander III. of Scotland, who was killed by a full from his herse in of scottand, who was killed by it all from his force in 1286. No modern nation has cultivated the composition of hallad posity so assiduously as the Germans. No doubt we have many specimens of the modern ballad; as Goldsonth's "Edwin and Angelina," Aytom's "Lays," and the "Bon Gaultier Ballada;" but there is nothable the classical turn given to those old popular compositions which we meet so often in modern days in Germany. The best English representation of this sort of ballad is to be found in Coloridge's "An-cient Mariner," containing many more sustained im-ginative flights than the old ballad could pretend to, and ensigzing, with a much more incessant acuteness, and analyzing, with a nation more theesant acuteness, the facilities and passions of the human heart. Yet this exquisite poem is the simple ballad all over in its style. The "Lenore" of Burger brought in a new era of ballad writing in Germany. He confined the name 'ballad, as Coleridge has also done in mitation of the the same parties with account to the latest the continued of the same parties with accounting the latest accounting the latest the belief, as Coeringe has also one in matter of him, to are epic marrative, with something fatulous and supernatural in the background, but still possessing enough of earth to interest the mass of humanity. Schiller, Ofthe, and Uhland have followed in his wake; and the latter, who, we believe, still survives at Tiller. bingen; has done much in modern times to familiarize nungent me gone much in modern times to familiarize the German mind with this species of composition. The ballad poetry of the northern nations, particularly those of Leeland, of the Farce Islee, of Donmark, and Norway and Sweden, retain their meient character to the present day. There is a peculiarly close affinity hetween many of these Seandinavian ballads and those of Scotland and Fagland, which has been noticed by various writers, both in this country and on the con-tinent. Not only have Pinkerton and Jamieson siluded

to this close relationship, but even Nyerup, Goijer, and W. C. Grimm have spacially commented on it. This reaemblance is to be traced both in the general plan and spirit of the poems and in the actual ametrial basis on which the structure of the ballad is rearred. Whether we are to ascribe this similarity to so remote whether we are to seemble the simularity at the remove a cause as the emigration into this country of the ancient Scandinavian peoples, or whether we are not rather to lean to the conviction of the ready transmission of fact or fiction of a stirring kind from one country to another, must ever admit of considerable doubt. The most complete collection of English and Scottish ballads in existence is an American one now

in course of publication.

Balbast, bull-lust (Ang.-Sax.), in Mar., a certain portion of iron, stone, gravel, or such weights material, placed in the bottom of a ship when she has either no cargo, or too little to bring her sufficiently low in the water. In the royal navy, fron ballast alone is used, in pigs of about 3 cwt. Iron ballast possesses the advanpage of about 3 cmt. From banks possesses the account tages of lying in a small compass, and of being, from its greater cleanliness, more healthy for the crew than shingle, gravel, &c. When a vessel has no other loading, she is said to be in ballast. The quantity of ballast, and its method of stowage, differ in different vessels. Masters of vessels are compelled to declare their amount of ballast, and to unload it at certain places.

BALL-COCK, bawl'-kok, a hollow sphere of thin metal, attached by a small rod to the cock of a water-distern. When the cistern is empty, the water flows in at the tap, but, with the rising water, the hollow sphere, the ball-cock, is buoyed up, and by this means the tap is

turned off when the eistern is full.

Baller, bull-lat (Gr. bullizein, to dance; Ital. bullare, to dance; Fr. bullet), an entertainment on the stage, in which a story is represented by dancing and pantonimic gestures, accompanied by appropriate music. In operatic performances a dance is frequently introduced under this name, such as the famous Pas des Patineurs, in Meyerbeer's opera "Le Prophète." The intricate figure-dances of the subordinate dancers are generally pleasing and well done; but the bounds, leaps, and pirouetting of the principal performers seem rather to be wonderful feets of strength and activity than actual daucing. Among the Greeks, the art of expressing passion and sentiment by dancing was brought to a great degree of perfection. The modern bullet was originated in Italy, by Count Aglio, of Savey. Eultagerini, a musician, introduced it at the court of France, in the time of Catharine de Medici. Since that time the ballet has retained possession of the stage, to the detriment of dramatic performances of a more devated nature. Noverre, a Frenchman, brought the ballet to its greatest degree of perfection about 1750.

BALLING PROCESS, immilising, in Chem., a term applied to the process by which sulphate of soda is converted into curbonate of soda. Sulphate of soda, limestone (carbonate of lime), and small coal are intimately mixed, and subjected to heat in a reverberatory furnace. Sulphide of sodium is at first formed, carbonic soid escaping in large quantities. By carefully regulating the heat, the limestone gives up its carbonic acid to the soda, receiving sulphur in exchange. The resulting mixture is termed black ash, or ordered coda, and contains carbonate of soda, line, and solphide

coda, and concains carronnate of acous, time, among an of calcium. (See Soda.)

Biliot. College, built-hi-ol, Oxford, was founded by John Balliol, of Bernard Castle, Durham, and Dervoquilla, his wife (parents of John Balliol, king of Scotland), between 1263 and 1268. Its revenues were soon augmented by the munificence of succeeding benefactors, particularly Sir William Fenton and Sir penchacters, particularly Sir William Penton and Sir Philip Someryle. It has at present ten fellowships and ten scholarships, open to all candidates, without regard to the place of their birth, residence, or edu-cation; also two followships and two scholarships, confined to persons elected from the grammar-school at Tiverton, in the county of Devon. There are also the Snell exhibitions, ten in number, tenable for five years, the nomination to which is vested in the principal and professors of Glasgow University, who appoint two anunally; the Jankyns exhibitions, two in number, tenable for four years, filled up by computation energy those members of the college who have not exceeded

4. Plate X11...a ded upon ballooning w Mr. Green made as of a ball regulate the course of a balloon of windraill, which he placed in the front to raise it to an aerial current having it was desired to take. M. Transon in ten or air-ship, consisting of two balloons a other by a cable. These balloons w other by a cable. These balloons were of buoyancy; the lighter one was intended to greater altitude than the lower one, the velocity regulated by means of sails. In 1890 Mesers, R and Marsh conceived a complicated machine, twenty small balloons were attached to a light fra work. Sir George Cayley contrived a machine to a a steering apparatus was affixed. Mr. Partridg put forth a plan wherein sails and vanes, put forth a pian wherein sais and wants, and a scame-night fed with liquid fuel, are amployed. M. Eubriot invented an oblong balloon with astla attached to a car. None of these experiments, however, achieved any practically useful assulf, About the year 1840, "Dr. Palli, of Milan, auggested About the year 1540, T. Kain, of mann, arguered that the structure of a fish should form the model for an arrial locomotive; but he was forestalled in his obvious but fallacious idea by other parties in England. In 1812 Mr. Henson took out his patent for that abrial machine which lived its little, with our relarity and then went out of sight. A small mear engine in a cor was to propel a light framework fect long; and a tail of 50 feet long was to serve as rudder at one end; but whether the machine a raise itself to a height, or could propel itself by engine, or could steer itself by the tail, were inquire nover satisfactorily answered. Next came M. Monge's copper balloon, constructed at Paris in 1944; it was about 30 feet diameter, formed of sheet copper one two-hundredths of an inch thick, weighed 300 in, and was empable of containing 150 lb, of hydrogen. The egg-shape, the fish-shape, the fan-shape, the kin-shape, all have been proposed time after time. Mr. Dill patented two machines, a balloon motor and a parachute motor, having both a custaining and a pro particular actor, having both a statisting and a pro-polling power, which constituted its own sustaining power. The plan looked ingenious upon paper; but this is not very high praise." The Eng. Cyclopedia, "Arts and Sciences," in 1852, published a scheme for steering balloons by means of rudders, levers, and sails. In 1856, the model of an "Archimedann balloon" was exhibited, in which a variety of ingenious applie were combined : the balloon itself was of form, with hemispherical ends: there were my give it a progressive motion; there was a screen it; there was a chemical engine to supply it w tive power; but the project has never been part In 1853 Lord Carlingford placed in the Di tion a model of his "Archedon," or serial was formed of a boat with a wheel in fro behind; at the sides were a comple of co neglect with which his invention was r "The first chariot I made was place exhibition, yet, strange to say, alther ple as was the principle of it, it nor even examined." The energy nor even examined." The en-grapher M. Nadard may as inventor of the largest aerial ma period had over ascended into the loud note of preparation, the mo structed after M. yards); in height 100 feet; to inflat cultic metres of pay line immone; a posed of two shinknesses of white quality, sewn entirely by bland sun quality, sewn antirety by illust sun double-thiched, task which employed the continuous labour of N women during on wheeth, Beneath this immense but and connected with it, there was a smaller ballon, called the "compensator," to receive the ciners gas caused by the distantion of the Gran's in the higher atmosphere, and thus prevent its waste and inher caused by the distation of "the Genn" in the higher atmosphere, and thus prevent its waste, and enable the acconants to preserve the means of continuing their voyage. The ear, or what replaced the car, was a small collode floore, consisting of a ground-floor and a gallary, the entire dimensions being about 8 feet in height, by 18 feet in length. In this car were comprised a small printing-office, a photographic department, four, beds, layatory, &c. The entire car was consider submersion impossible. Twenty thousand yards of white silk at six shillings per yard were required for the construction of the machine. On this occasion its occasion its occasion its occasion its occasion its occasion. the construction of the machine. On this occasion it made a safedescent at Barcy, two leagues from Meaux. Phis monster made subsequent voyages, and upon one occasion the passengers were subjected to great danger. "The Gight" has since been relegated to that obscure depository where so many of its predeces-sors have found obliviou. An engraving of "the sore have found obliviou. An engraving of "the Giant" is given at fug. 5, Plate XIII. A huge Montguiffer, or heated air balloon, ascended from Cremoree Gardens several times during the year 1804. The "Ragie" of M. Eugène Godard far surpassed eventhe "Giant" in size, as will be seen by the following statistics, which go far beyond the dimension of any other balloon yet made. In height it was 17 fest 7 inches; in circumference 95 feet 9 inches; in aren 30,000 feet ; in weight 2,005 lb. ; in cubic capacity 499,556 feet. It contained 4,793 square yards of silk, in 1,910 pieces of 96 stripes; 14,203 feet of stitching; 96 cverlaps of joints, making 13,848 feet more of sewing, and 17,244 feet of galloons, which form the network: these galloons were stitched on both sides, and contained 24.346 more feet of stitching. Twenty-four compart-ments in the parachute which surrounded the upper partion of the balloon (see engraving, fig. 6, Plate XIII.) required 6,824 feet of stitching. The whole contained 69,324 feet of stitching, requiring 2,706 days of work. The valve was 4 feet 8 inches in diameter; the dishipped car waighed 555 lb., and was 13 feet 2 inches in diameter. In the centre of the car was an 18-feet stove, including the chimney, 980 lb. in weight, 6 feet 6 inches in dispreter, composed of three cylinders apart from each other, invented by M. Godard, with the view to counteract the effects of the radiated heat upon the occupants of the car. Inside the flue was placed a metal colonder to intercept sparks. The combustible matter sequired for filling the balloon with heated air was rve-straw compressed into blocks. The total weight of the machine (including grapping-iron cords 400 lb., two supplemental pumps 150 lb., and combustible 500 lb.) was 4,620 lb. This gigantic machine made several trips from London in salety. During a period of forty-four years, from the date of the ascent made by Signor Brinschi in 1808 to the year 1850, when MM. Bigg and Barral made an ascent from the Observatory at Paris, no attempt had been made to put the balloon to a scientific use. The last-named sacaus made several ascents, and collected some information con-ducing towards the science of meteorology. Mr. Welsh's experiments, conducted at the expense of the British Association, were carried out in the year 1852.

A great number of observations were made by this gentlemen, the result being the following deduction as to the decline of temperature with elevation: that the temperature of the air decreases uniformly with the height above the earth's surface, until at a certain the height above the earm a surrace, unto at a certain elevation, varying on different days, the decrease is arrested, and, for a space of 2,000 or 3,000 feet, the temperature remains nearly constant, or even increases by a small amount; the regular diminishing being alterwards resumed and generally maintained at a rate slightly less rapid than in

pacificate. The preventy objects of the (the expense of which was defrared by Association) were the determination of a ture of the air and its begrometrical states whether miss; to determine ture of the air and its begrometrical states at different selevations up to five miles; to determine the distribution of the air; to determine the original state the air by means of ordine papers; to determine time of vibration of a magnet in the earth, and different distances from it; to determine the tempture of the dew-point by Daniell's dew-point by meter, Regnault's condensing hygromesar, and employing the dry and wet bulb thermometers ordinarily used; to collect air at different identities note the height and kind of chords their deservations. to note the height and kind of clouds, their de-and thickness at different clevations; to deter-the rate and directions of different currents in atmosphere; to make observations on sound; to atmospherical phenomena in general. In a read before the Royal Institution, Mr. Glaid scribed the various ascents made by him, and gets the results of his observations. These observations may be thus summarized:—1. That the temperature of the air does not decrease uniformly with the height above the earth's surface; and consequently the theory of a decrease of one degree of temperature for an increase of elevation of 300 feet, must be abandoned. In fact more than one degree declined in the first hundred feet when the sky was clear, and not so much as one degree in 1.000 feet at a height exceeding five miles. These experiments are the first to yield any definite information on the subject : more experiments are required to settle the law satisfactorily, but its effects on the laws of refraction will be great. 2. The degree of humidity decreased wonderfully with the heig till, at above five miles, there was scarcely any aqueous vapour at all. 3. That an aneroid barometer can be made to read correctly—to the first pludecimals certainly, and to the second place of dec probably-to a pressure as low as seven inches. 4. That a dry and a wet-bulb thermometer can be used effectively up to any height on the earth's surface where a man may be located. 5. That the balloon does afford a means of solving with advantage many delicate questions in physics. Having passed over the whole ground of the subject, we have seen that the balloon may be used with advantage in war, and as an agent may be used with advantage in war, and as an agent for the gathering of scientific data; but that, as a neans of hearing man through the air at his own will and pleasure, and according to any direction sought by him, the machine is, up to the present time, of no avail. The subject of ballooning has quite recently received renewed attention, and several ingenious minds have conceived and exhibited divers forms of machines for carrying man through the air. There is an Aëronantical Society lately formed, which has held meetings at the rooms of the Society of Aria; and an exhibition of models connected with the subject has accord times taken place at the Crystal Palsoe. Mr. several times taken place at the Crystal Palace. Mr. Charles Tomlinson, in the appendix to the last edition of his valuable Cyclopadia of the Useful Arts, makes, the following sensible and practical observations:

"Although, perhaps, it would not be quite true to say that the search after the directive power of a lattoon must be ranked with that for perpetual motion, or for the squaring of the circle, yet the solution of the problem is attended with so many difficulties as to be all but impossible. Skilful engineers and profound mechanicians avoid the subject, just as good mathe-maticians shake their heads at the squaring of the circle, and chemists smile at the transmutation of metals. Badly educated men declars this to be the result of prejudice; they call it 'slavary to preconceived notions,' forgetting that the world has ac time to be constantly reconsidering questions which have been set at rest by well-established principles. Every now and then we meet with persons who declare for Isuac Newton's astronomical doctrines to be quite wrong, and astronomy in general to be at fault. the lower part of the atmosphere, and commencing the strong in general to be at ladd. It is not too man to say that such persons do not underfrom a higher temperatures has would have existed but for the tatherniption noticed. In the course of the but for the tatherniption noticed. In the course of the them to do is to remain quiet. We would also give last few ream Mr. Glaisher, of the Royal Observatory the same advice to any of our readers who may wish

and clouds in booked for above it. These hazardous suberprises have so far resulted in no practical good, nor do they seem likely to lead to any useful object,

except it be for military reconnectring. Balleons must be waited along by the currents of air in which they float paragraphy independent of any power that can be applied to them from within. Enveloped in clouds, the abronant may be swept along with the switness of a tornade, with nothing to indicate to him that he in not in the quiet of a calm; and of course with no means of knowing the direction of his progress, when he cannot be aware of any progress at all. As the course of the winds, at different elevations, becomes

more perfectly understood, balloons may to some exused for passing from one part of the country

to another; but this can be only along the lines of their currents, and, in approaching the surface, the voyager must be exposed to its fluctuating breezes, with no ability to select the place for his landing. Man has got to discover some new principles that shall

give him a partial control over the elements, or else thoroughly comprehend their operations before he can

apply to any important purpose the power he possesses of rising into the air." Mr. Monck Mason, describing his serial voyage with Mr. Green, in the great Nassau balloon, to Germany, says, of the extraordinary silence

that reigns in the upper air : "No words can in truth

sufficiently represent the remarkable condition of the ekies with regard to the absence of sound, or convey

any just notion of the extent to which that particular

every other situation in life-on the summit of the est mountain, in the depth of the lowest cavern ; in the desert and on the sea; in the dead of night and the stern repose of the veriest calm-sound, to a certain extent (however it may escape our habituated faculties), always exists. The vicinity of solid bodies, the resistance of the air, the influences of changes of

temperature upon adjacent matter, nay, the very pro-cess of vegetation itself, are so many sources of sound

from which man is never entirely free, until the aërial car has snatched him from their influence, and transported him to regions where none such are ever to be found." In another place the same writer says: "It has frequently been inquired of me whether, under

circumstances of such excessive elevation, any symptoms of convexity can be detected in the appearance of the hegizontal piane, such as a knowledge of the real form of the terrestrial globe might have authorized us

to expect. When, however, we consider the immense disproportion which exists between the actual diameter

of the earth and the utmost altitude to which man cease to look for such a result, or be surprised at observing the deficiency. Were we to assume an elevation of forty-two thousand feet as the ne plus ultra of advoustrical enterprise, still, computing the earth's

condition is capable of affecting the human organs. All, in fact, that can be said upon the subject by way of illustration is that here, and here only, absolute

silence can be said to have any existence at all.

struggle between the French and Germans, in 1870, to become a balloon mechanician. Let him devote his time and means to the acquirement of a good, sound knowledge of theoretical mechanics, and he will then have no taste for feating in the radiculous ginoracks which are almost severy day monocost for sailing in the air." A writer in the New American Cyclopedia remarks: "One of the most interesting meteorological phenomena notinged by the accounts is the occurrence of the radiculous in strata which are separated by a clear space of some thousand feet, it may be, in thickness. Any layer of clouds from which the rain falls is sure to be succeeded by a stratum of clear blue sky; and eger this is found another cloudy belt. If rain fall from this too, the same succession of blue and sky and clouds in the hook of or above it. These hazardous to become a balloon machanician. Let him devote his ballooning was not conspicuously turned to account.

Monck Mason's Aëronautich, or Sketches, Theory, and Practice of Adrestation.

Pressing of Advantation.

Bankoon, a French term for a quantity of glass.

Twenty-live bundles of white glass and twelve and a half of coloured glass make a balloom.

Bannon ball-bat (Fr. ballote, a little ball), is a term employed to denote a secret method of volting; so called from being usually done by means of little balls, which are put into a box, and afterwards counted, thereby to disclose the opinion of the majority, without discovering that of any individual voter. Usually the balls are of different colours—white and black the balls are of different colours,—white and black, the white being "for" and the black "against;" and hence the expression to "blackball" one. Somehence the expression to "blackball" one. Sometimes, in place of the balls being of different colours, the box is divided into two compartments, one of which represents the prox, the other the constinues sometimes, in place of balls, folded pieces of paper are used, either containing simply "yes" or "no," or the name of the caudidate or candidates whom the elector supports. In clubs, societies, and other similar bodies, voting by ballot is the mode usually adopted in the election of members or office-bearers. The term however is principally important in its The term, however, is principally important in its political sense, as applied to the great question of secret or open voting in the election of members of the legislature. Secret voting was practised by the ancient Greeks by means of balls, stones, or shells, with marks. Among the Romans, tabula, tabella, or tickets, were chiefly used; and different laws were from time to time passed regarding the system of secret voting. the Gabiana Lex, for the election of magistrates, dating from about 140 B.C. In modern times, the ballot was long in use in the Venetian senate. A tract, entitled, "The Benefit of the Ballot," said to have been written by Audrew Marvell, was published in the "State Tracts," 1693; and the ballot was first proposed to be used in the election of members of parliament in a pamphlet published in 1705. In France, secret voting existed in the Chamber of Deputies from 1845, to 1845, and was employed after the coup d'état of 1851. It has also been adopted in many of the United States of North America, and became part of the electoral law of Vic-toria in 1856. The subject of the ballot has occasioned frequent discussions and divisions in parliament, and since 1835 it has been an open question in all Whig governments. On June 30, 1857, the House of Com-mons rejected the ballot by a majority of 69, -199 being for, and 257 against ic; and on April 23, 1861, a motion to bring in a bir! on this subject was negatived by 279 against 154; majority 125. Our limits necessarily pre-clude our entering upon the arguments that are ad-vanced on either side. There are, doubtlesse, cvils connected with the present open system of voting: but would these be done away with, or, rather, would not their place be occupied by others of a worse nature, if the ballot were adopted? This is a question that must necessarily be considered. Would all intimidation and bribery cease if secret voting were had recourse to? or would these be carried on as before. from a reliance upon the general good fuith and honesty of mankind? Might the landlord not still ask his tenant how he intended to vote, and would the tenant escape by silence, or would be purchase peace by a falsehood? If the latter, then, certainly, the ballot affords him a means of avoiding detection which the present system does not. While it might prevent had influence being exerted over the good, would it not destroy the good influence which publicity exercises over the bad? Publicity is, further, an essential element in the British constitution. In all other matters, persons who are charged with a duty have to perform persons who are charged with a duty have to perform that duty in public;—are there sufficient reasons for departing from it in this case? But the principal argument against the ballot, and that which its supporters have never yet satisfactorily answered, is, that the suffrage is a trust vested in certain classes of the people for the benefit of the whole. Every elector is hence bound to use his suffrage, according to his best and most conscientions judgment, for the good of the public; and every one of the public has a right to know in what way that suffrage has been exercised, and has in what way that suffrage has been exercised, and has

100

radius at four thousand miles, and reckoning five thousand and eighty fact to each mile, the prominence of the speciator beyond the surface of his horizon

of the spectator beyond the surface of his horizon would even then amount but to the thousandth part of the extreme lateral extension; in other words, he would only have reached a diameter beyond the plane of his vision as great as the thickness of the amailest letter we are now employing would project upon the face of a globe of ten inches dismoter." Is the war in Italy, in 1806, the French made use of ballooms for reconnoitring purposes; but in the

Balm

Rambusa

just cause to consider himself wronged if it is performed otherwise than honestly and carefully. "I contend," said Lord John Russell, in a speech on this subject, "that the whole community; whether electors or nonelectors, have a deep interest in knowing how the votes are given which elect those who are to dispose of the welfare of the state." One of the ablest men and clearest thinkers of the present day, Mr. John Stuart Mill, in writing upon parliamentary reform, says: "Thirty years ago it was still true, that, in the election of members of parliament, the main evil to be guarded against was that which the ballot would exclude—coercion by landlords, employers, and customers. At present, I conceive a much greater source of evil is the selfishness, or the selfish partialities, of the voter himself. A base and mischievous vote is now, I am convinced, much oftoner given from the voter's personal interest or class interest, or some mean failing in his own mind, than from any fear of consequences at the hands of others; and to these influences the ballot would enable him to yield himself up, free from all sense of shame or responsibility."—Ref. On Repre-centative Government, by John Stuart Mill. 1861.

BALM. (See MELISSA.)

BALM OF GILEAD. (Nee BALSAMODENDRON.)

BALEAN, baul-sam (Gr. beleamen), a name formerly given to almost every oily or resinous substance exuding from trees; but now used by scientific men to denote a vegetable product containing either benzoic or cinvamic acid. The true balsams are much used in medicine on account of their stimulating, expecterant, and tonic properties. The most important are the balsams of Peru and Tolu (see MYROSPERMUM), benzoin (see STYBAX), storax, and gum-wax (see Liquinamera). All those substances are vory fragrant. They vary much in their consistence. Thus benzoin is solid, hard, and brittle; Peruvian balsam is fluid; and Tolu is internediate, being a very soft and readily-fusible solid. Copsiva, commonly called balsam copains, is not a true balsam, but belongs to the class of olco-resus. The same may be said of Canada balsam. Several medicinal mixtures, in which oils enter, are commonly included under the head of balsams. Thus the preparation known as ladsam of sulphur, used as an application to foul ulcers, consists simply of flowers of sulphur in clive-oil.

BALSAM. (See IMPATIENS.)

RALSAMIPLUA, bill-si-mif'-lu-ii, in Bot., a nat. ord. of dicotyledonous plants, consisting of only one genus. The species are balsamiferous trees found in the warmer parts of India, North America, and the Levant. By some botanists the order is named Allingiacca. (See LIQUIDAMBER.)

BALSAMINACEE, bal'-ca-mi-nai'-se-e, to Bot., the Balsam family, a nat. ord. of dicotyledonous plants, in the sub-class Thalamiform. There are but two genera, Imputions and Hydrocera (see these words), which include 110 species. These are scattered over the globe, but are chiefly natives of India, growing in damp shady places, and where the temperature is moderate. They are all herbaceous plants, with succulent stems containing much watery juice. The flowers are very irregular, ing much watery juice. The flowers are very irregular, and the petale often finely coloured. The fruit is irrecelled, and usually bursts with elastic force so as to scatter the seed over a considerable area. The plants are said to have diurctic properties, but they are never used in medicine.

BALSAMODENDRON, bal-sa-mo-den'-dron, in Pot., an important gen. of plants belonging to the nat. ord. Amgridacea. The species are natives of the East, and are remarkable for the odoriferous gum-resus which exude from their trunks. B. myrrha, a small tree growexide from their violes. In myrran, a sman tree growing in the north-matter parts of Africa, and in the adjoining parts of Arabia, is believed to be the principal, if not the only source of the fragrant gum-resin known in commerce under the name of myrra. This is called in Hebrew mor or mur, and is mentioned in the Old Testament for the first time in Gen. xxxvii. 25: hence is at first soft, oily, and of a yellowish-white colour; on exposure to the air, it soon acquires the consistence of butter, and in time begones much harder, and of butter, and in time begones much harder, and only see are hard externally, being coated with flint, ohonges to a reddish huc. Medicinally, myrrh is reasonable and are hollow, except at the nodes, where strong guarded as a tonic, stimulant, expectorant, and anti-

spasmedic, when taken internally: as an externa. application, it is sattingent and stimulant. It is an ingredient of the inceuse burnt in Roman Catholic chapels, and of some kinds of pastiles which are used for fumigation. The substance called bulm of Gilead, or balm of Mecca, and which is supposed to be the bala of the Old Testament, is said to be procured from B. gileadenie; some authors, however, name B. opobal-samum as its source. This substance was, in ancient kamum as its source. This substance was, in ancient times, regarded as a cure for almost every disease; but it is seldom used at the present day. The gum-resin, known as Indian Indellium, or fulse myrrh, and apposed to be identical with the bullium of Scripture, is probably the produce of two species of this genus; namely, B. mukul, and B. pubescens. It is the google or guggar of the Beloochees, and the mokul of the Perstans. It is very smillar to myrrh. African bullium, another of the gum-resins of commerce, is said to be an exudation of the species A. africanum.

BALUSTER, bull-resider, in Arch., a term used to indi-

BALUSTER, ball-ns-ter, in Arch., a term used to indicate the little columns which are used to fill the openings in parapet-walls on the tops of houses, or openings in parapet-walls on the tops of houses, or which, when surmounted by a rail, form a balustrade to any long passage or gallery open on one side, and thus partially inclosed, for the sake of ornament or protection. The upright rails of a staircase supporting the hand-rail are called balusters, and sometimes ballisters or bannisters. The word is of doubtful origin. Nicholson, in his Architectural Dictionary, derives it from balustrium, a railed inclosure in the old Roman baths; others derive it from bulanstrion, the Greek for the flower of the wild pomegranate; while the deriva-tion adopted in the English Cyclopadia is the Latin balista, an engine of war used for hurling large stones ballsid, an engine of war used for maning angle and and beams, which was placed in a space railed in, called the balistarium; and hence the rails inclosing stairs, communion-tables in churches, terraces, &c., came to be called balusters. The ornamental form of the baluster is that of a dwarf column, with plinth and abnous, ornamented with bands and a swelling projection near the lower end.

BALUSTRADE, bel'-us-traid (Sp. belaustrade), a row of balusters surmounted by a cornice or hand-rail, used to give a finished appearance to the tops of large buildings of some architectural pretension; or for the inclosure of stairs, balconies, parapets of bridges, &c. (See Balustrae.) The balustrade in the Villa Conti, ut Pruscati, is nearly 700 yards long. Good examples of the architectural balustrade may be seen at the Villa Albani (Rome), Whitchall, and St. Paul's Cathedral.

Bamboo. (See Bambusi.) Bambusa, bām-bu'-sā, in Bot., the Bamboo, agen. of plants belonging to the nat. ord. Graminacea, the Grass family. The species are numerous, and are found in the tropical and sub-tropical regions of both eastern

western and bemispheres. They are graceful and noble - looking for plants: though they are merely grasses, according to the botanical meaning of the term, their jointed stems sometimes reach the height of from 20 to 100 feet. The stems in each species arise from a strong-jointed subterranean creeping root-stock, which which

HAMBOO.

### Bampton Lectures

number of closed-up cylinders. The cavities thus formed are usually filled up with soft loose pith, which may be easily withdrawn from any outting. A pseuliar finity secretion, called \*\*abasker\* (which set), is found in the joints of some species. The stems of different species of hamboo are applied to such a multitude of useful purposes, that a large volume might be devoted to a complete account of them. Good paper is made from them in China and other parts of the world. The from them in China and other parts of the world. The very young shoots are boiled and eaten like asparagus, very young shoots are posted and caren nice asparagus, and are size used for pickles and sweetments. As for the hollow stems, they may be said to be used as materials for houses, furniture, clothing, musical instruents, colar, and weapons, in all the countries where they flourish. Dr. Hooker says that in some districts are the state of the said for water, buckets. a very large kind of bamboo is used for water-buckets, another kind for quivers, a third for flutes, a fourth for another and for quivers, a third for the ske twork, a sixth for arrows, and so on. In China we find the bamboo used for water-pipes and fishing-rods, and for making hats, shields, umbreilas, soles of shoes, baskets, ropes, paper, scaffold-poles, trellis-work, sails, covers of boats and

BAMPTON LECTURES, THE. bömp'-ton, are name after their founder, the Rev. John Bampton, cannon of Salisbury, who left certain estates to the university of Oxford, for the endowment of eight divinity lecture-Oxford, for the emowment of eigh divinity, tetutresermons, to be preached annually at St. Mary's, Oxford, and afterwards published at the expense of the
foundation. The preacher must be at least a M.A. of
Oxford or Cambridge, and the same person can never
preach them twice. The lectures are to be on one of preach them twice. The lectures are to be on one of the following subjects:—to confirm and establish the Christian faith, and to confute all heretics and schismatics; upon the divine authority of the Holy Scriptures; upon the authority of the writings of the primitive fathers; as to the faith and practice of the primi-tive church; upon the divinity of Jesus Christ; upon the divinity of the Holy Ghost; upon the articles of the Christian faith as comprehended in the Apostles' and Nicence creeds. The first course was delivered in 1780; and among the more distinguished persons who have held this office are Mant, Heber, Whately, Milman, Hampden, and Mansel.

Ban, him, is a word which occurs in various senses in wars of the modern lummings of Furnity.

many of the modern languages of Europe. Its primary signification, however, and that which runs through all signmention, nowever, and that when rouse through all the others, is that of proclamation or publication; as in banus. (See Banus of Marriage.) It is used both as a substantive and verb by the early English writers, in the sense of cursing or denouncing woo and mischief against an offender. When a grant of land was made against an offender. When a grant of land was made for a religious purpose, the transaction was proclaimed with certain ceremonies, and curses were denounced against any one who should hereafter violate the deed. Persons who escaped from justice, or who opposed themselves to the sentence of the Church, were also sometimes banned. In Germany, persons or cities comessives to the sentence of the Church, were also sometimes banned. In Germany, persons or cities who opposed themselves to the general voice of the confederation were, by some public act, placed under the ban of the empire. In France, in feudal times, the barons who held of the king, when summand the band when it is the contract was called the house to attend him in time of war, were called the ban, and the tenants of the secondary rank the arrière ban. In the Sclavonic tengues, but means lord, sud was the title given to some of the military chiefs who were over certain of the frontier provinces of Hungary; hence termed banats.

Baraha. (See Mush.)
Baraha Placetories, or Common Bench, or Common Plens. The judges of the three superior courts of common law sit in banc or besico, that is, on the bench, of their respective courts at Westminsten, during term-time, and for a short period after, for the purpose of deciding questions of law coming originally before them, or by way of reference or appeal from the decision of a single judge at mist print, and otherwise. (See Affeat.)

Band, dind (Sax. band, Du. bende), in Arch., a throad flat moulding projecting a little beyond the surface of the building or column to which it is applied. It is sometimes placed along the front, or completely count buildings, and serves to indicate the different pinded when the arch. of the Remissance over it like a label. floors; but it is principally used in the basements of large edifices. The band of a column is sometimes moulded in various forms, and is then called a shaft

mouled in various and proper from the first and state of the aregiment or hattalion, usually about twenty in number, and distinguished by a particular uniform. BARDAGS, bind'-dige (Fr.), in Surg., is a piece of linen, calico, or flamel, used for binding up a wounded limb, or to retain dressings upon wounds. Handages are of various kinds, according to the purpose they are intended to serve. The most common form are intended to serve. are intended to serve. The most common form is a long strip of stout calico, varying in breadth from two to six or eight inches.

Previous to its application it is wolled up; and hence it is commonly termed a roller. There are also the T bandage, so called from its resemblance to the letter T; the 18- or many-tailed T; the 18- or many-tailed bandage, composed of one longitudinal piece, with a number of transverse pieces, or tails, to fold over the injured part; the suspensory bandage, &c. Much frequently depends upon the proper use and application of a bandage. The great object is to give equal

great object is to give equal and uniform pressure and support to the part, and to adjust it so that it may not be displaced or deranged by any movement of the patient. Of late years, elastic bandages have been much used. Flannel handages are used where warmth as well as support is required. Bandaken, or Bandaken, beardotter, bit handaken, or Bandaken, or beardotter, in Mil., was a large leathern belt thrown over the right shoulder, and hanging down under the left arm.

right shoulder, and hanging down under the left arm. It was worn by the ancient musketcers, for sustaining their firearms and for the carriage of their musketcharges, which, in small tin or wooden cases, were hung, to the number of twelve, to each bandaleer.

Bandama, or Bardanna, bān-dān'-nā, a method of printing calico, in which white or coloured spots are produced on a dark ground. The process seems to have had its origin in India, where it was practised by the Hindoos from time immemorial. The mode emitted the Hindoos from time immemorial. The mode employed was that of binding up securely with thread those parts of the cloth which were required to remain white or yellow, and then exposing the whole to the action of the dve. Bandans handkerchiefs are now largely made in Europe, and have quits superseded in beauty and precision the Oriental patterns. The process by which they are made was invented by M. Koechlin, of Mühlhausen, in 1810. The usual method employed is as follows:—The pattern desired is cut out it we sheet of lead, which are placed at the ton and in two sheets of lead, which are placed at the top and bottom of a pile of handkerchiefs, mostly dyed with Turkey-red. Bleaching liquid is then forced, by means Turkey-red. Biseaching-iquid is then forced, by means of a powerful Bramah press, through the perforations in the top sheet of lead, through the pile of handkerchiefs, and out of the perforations in the lower sheet. The bleaching liquor in its course discharges the colour from the cloth and leaves the pattern. Bandama hand-in-like the pattern and the propulse at the pattern. kerchiefs are not so popular as they were at one time; but M. Kocchlin's process is valuable in many other

HANDED, bint-ded.—In Her., any charge, such as a wheatsheaf or bundle of arrows, is said to be banded when it is tied together with a band of a different colour from the charge itself. Thus a goiden wheatsheaf tied with a red band would be thus expressed in heardlife there.

# Bandlcoot

to receive names or inscriptions. In Mil., it means any little flag or pennon attached to a spear, and the fringed flag hanging from the straight trumpet used by cavalry, or sounded before the heralds when making any proclamation. It is sometimes written bandrol and bannerol.

Handicoot, bin-di-boot (Perameles), a marsupial animal, indigenous to Australia. In some respects it is analogous to the opossum and kangaroo; but its hinder legs, though much longer than the anterior ones, do not present so great an apparent disproportion as in the last mentioned animal. It is a nocturnal animal, and burrows for itself a dwelling in the soft earth, for which purpose its claws are well adapted. The flesh of the bandicoot is said to resemble that of the rabbit; but the food of the former is generally of a very dif-ferent nature, consisting chiefly of insects and grubs. Its gait consists of a series of hops, in which, like the

rabbit, it is said to use its fore feet.

Bandir, bân-dit (Ital. bandito, an outlaw, from bandire, to banish), literally signifies a banished or outlawed person; hence one who is at war with civilized society, a highway robber, a hired murderer. The banditti in Italy formerly formed among themselves a kind of guild, with very stringent laws, and carried on a constant warfare against civilized society. The strong measures which the papal government, in 1820, took against the banditti and their abettors broke up their against the banditi and their spectors broke up their invining-places, and rendered them in a measure homeless. In many parts of Italy, however, particularly about Naples, the banditti are peasants of the country, who, besides being engaged in agriculture, employ themselves in robbery and murder. Peter of Calabria, one of the most celebrated of their chiefs, in 1812 assumed the titles of "Emperor of the mountains, Trans of the convailed and King of the forests, Protector of the conscribed, and Mediator of the highways from Florence to Nagles." The government of Ferdinand I. was obliged to enter into treaties with this monarch. The banditti are quite distinct from common robbers, who are called matriventi. More recently the banditti, by being joined by adventurers of all kinds, had become so strong and troublesome, that the Austrian troops who occupied Naples had to send large bodies of men against them. In Sicily they are most numerous in the Val Demone, where they were formerly so powerful that the prince of Villafranca, for political and other reasons, declared himself their patron, and treated them with much confidence, which they never abused. The revolution of 1848-9 added greatly to their numbers and strength. In 1866 our countryman Mr. Mores was taken prisoner by a band of these rascals in Neapolitan territory. He was subjected to many hardships, and was with difficults and the subjected to many hardships, and was with difficulty released upon payment of the sum of £5,100.

BANDOLINE, OF FIXATURE, ban'-do-leen, a preparation sold by perfamers, and much used by ladies for stiffen-ing and fixing the hair. It is merely a thick mucilage, obtained either from Carrageen moss or gum-traga-canth, seented with cau de Cologue or other perfumed spirit. A very delicate bandoline may be prepared by soaking quince-seeds in cold water for a day or two,

and then straining the mucilage.

Bandone, ban-dor (Sp. bandurria), a stringed musical instrument, bearing a strong resemblance to a lute. It was invented by John Rose, in the fourth year of the reign of Queen Elizabeth.

BANE, bain (Sax. bona, a murderer), denotes poison, or any cause of destruction or overthrow; as, "My bane and antidote are both before me."

BANEBURE, bain'-ber-e, in Bot., a name given to a species of Actea, the root of which is sometimes used species of Actea, the root of which is sometimes used medicinally, on account of its antispusmodic, expectorant, and astringent properties. It is a perenuial herbaceous plant, from one to two feet high, with triternate lessves, the leaflets of which are deeply cut and serrated. The flowers are in racemes; the berries are black and poisonous. This plant (A. spicata) is also known by the name of Herb Christopher. It belows to the nat od Ranunculaces. longs to the nat. ord. Ranunculacea.

#### Banishment

is not of this world." In this discourse he descanted upon the true nature of that kingdom which Christ came to establish upon earth; that it was wholly in-tellectual and spiritual; that he had not delegated his tellectual and spiritual; that he had not delegated his power, like temporal lawgivers, to any vicegerents or deputies upon earth; and hence, that the Church did not, and could not, possess the slightest degree of authority under any commission, or pretended commission, derived from man; that the Church of England and all other national churches were merely civil or human institutions, established for the purpose of difficulty and conventualing the knowledge, and ballet of fusing and perpetuating the knowledge and belief of Christianity; and that the truths of Christianity did not differ in their nature from other truths, except by their superior weight and importance, and were to be inculcated in a manner analogous to other truths, only demanding, from their higher import, a proportionably greater degree of care, attention, and assiduity in the promulgation of them. The publication of this sermon immediately produced a great commotion in the Churchia it was condemned by a committee of Convocation, and the proceedings of Convocation were arrested by an order from government; Drs. Snape and Sherlock wrote confutations of it, for which these divines were removed from their office of chaplains to the king. With the king and the government on the one side, and the church party on the other, the controversy was carried on with great animosity for many years.

Banian, bai'-mi-an, a general name given in India to a

BANIAN, bai'-ni-an, a general name given in India to a merchant, more particularly to the great merchants of Western India, at Bombay, Surat, Cambay, &c., who carry on an extensive caravan trade with the interior of Asia, even to the borders of Russia and China. Mercantile establishments of Indian Banians are to be found in almost every important commercial city of Asia. The Banians form a particular caste in India, and are distinct from the Brahmins, Cuttery, and Wyse, the three other castes. The name Banian was at first given by Europeans to all the Hindoos, they being the class with which they had most frequent intercourse; and hence the term was used in contradisbeing the class with white they had not frequent in-tercourse; and hence the term was used in contradis-tinction to Mohammedan. The Banians are very strict in the observance of the fasts prescribed by their re-ligion, and in refusing to cat flesh.

Bantan Days, a cant term among sailors, denoting those days on which they have no meat served out to them, derived from the practice of the Banians, who never est flesh.

BANISHMENT, ban'-ish-ment (Sax. ban, a proclams. tion, afterwards a curse), is the expulsion, by the judg-ment of some court or other competent authority, from ment or some court or other competent authority, from any country or place, for some read or supposed offence, —it may be for life, or only for a limited period. The term is also applied to the fleeing from one's own country to avoid some punishment or danger, when it is usually called voluntary banishment. Banishment, as a mode of punishment, has been prevalent in most civilized countries, ancient as well as modern. Among the ancient Greeks, banishment was mostly voluntary, the removing from the country of one accused of an offence; and laws were laid down defining its limits, duration, and legal consequences. The Greek name for banishment was phuge; whence is our word fugitive. Phuge, in a general sense, denoted every kind of banishment; but in a more particular sense it was dis-tinguished from outracism, masning as those who were under phage (for life) lost their property by confis-cation, while the ostracised did not; the former, also, had no fixed place of abode, and no time of return assigned; the latter had. In fact, ostracism was not, properly, a punishment for an offence, but rather the banishment, for a time, of such as were supposed to be too powerful or to have too much influence in the state. "Democratical states," says Aristotle, "used to ostracise, and remove from the city for a definite time, those who appeared to be pre-eminent above their fellow-citizens, by reason of their wealth, the number of their friends, or any other means of in-fluence." Ostracism was for ten years; but at Syracuse, longs to the nat. ord. Manusculaces.

Banerer. (See Bannerr.)

Bangorian Controverses, băn-gor'-i-an, one of the most remarkable controversies that has arisen in the Church of England. It was occasioned by a sertiment preached by Houdley, bishop of Bangor, before mon preached by Houdley, bishop of Bangor, before didtio again 2 against und 3 deportatio. Relegatio was George I., March 31, 1717, of the text, "My kingdom the mildest form of banishment, by which the offender 193

#### Rank

was interdicted from living in Rome or any particular province, or was compelled to reside in some assigned place, either for a definite or an indefinite period; but the sentence did not involve loss of property or dissensing. The interdictio again at igns,—interdiction of fire and water, while it did not directly experiest the oulprit, or deprive him of citizenship, had the effect of incapacitating him from obtaining the means of existence in his own country, and thus indirectly compelled him to seek refuge in another. The third mode,—deportatio, was the accessed of all and are introduced under the was the severest of all, and was introduced under the emperors in place of the interdictio aque et ignis. By it, the criminal was deprived both of property and of the rights of citizenship, and not unfrequently he was conveyed to some remote island, where, loaded with fetters, he was conveyed to to hope for the rest. with fetters, he was compelled to labour for the rest of his life. During the first French revolution, banishment (doportation) was introduced, and was substituted for the guillotine; and towards the end of Robespierre's administration it became very general. It still forms part of the French code, where it is classed in the third degree of infamous punishments, and when for life, it gives rise to civil death. Previous to 1843, however, this mode of punishment had long been in abeyance, imprisonment being usually substituted; but since that time it has been much arrelated as means of retting time it has been much employed as a means of getting rid of political offenders. As a punishment for crimes, compulsory banishment was unknown to the ancient law of England, although voluntary exile, in order to escape other punishment, was sometimes permitted. It is said to have been first introduced as a criminal punishment in the 39th year of Elizabeth, when a statute was enacted decising that "such rogues as were dangerous to the inferior people should be banished the realm." But it was not till a much later period that this mode of punishment came into general use and obtained the sanction of the legislature. (See TRANSPORTATION.)

BANK, bank (deriv. uncertain) .- The term bank having several significations, renders it difficult to assign to it a common derivative. It has two principal distinct meanings, one in reference to commerce; the other to geography and rural economy, implying an elevation of the earth, either natural or artificial, and either below or above the surface of the water, in rivers as well as in the ocean. It is further a technical term in law; the judges of the supreme courts of law, when sitting in judgment collectively, are said to sit in bank, banque, or banco. It is also a military term, denoting an elevation of earth within the parapet of a fortification, generally between two and three feet high, or more, according to the height of the parapet, being about four feet and a half lower than the top of the parapet, three feet broad, ascended at intervals by paraget, three seet broad, ascended at intervals by steps, by which the garrison get up to fire on, or to observe the proceedings of, the besiegers. Junius derives the word from the Dutch bancke, which signifies to beat, to strike; as the waves perpetually strike against the shores of the sea, and the current of the truer present against its side. Shimas and believed. river presses against its sides. Skinner and Johnson was that it comes from the Ang. Sax. bane, tunulus; Wachter has bane, a hill, mound, heap, and any eminence or rising place. It is transferred, he adds, to all eminent or rising places for sitting or lying; as banks of oars were not on the same level in ancient ships, but seats raised above one another. It may thus be applied to the table or counter of merchants, traders, or money-changers, who, being the most eminent persons amongst those who formerly carried on their commercial transactions in the open market-places, would naturally assume a more clevated position than the common traders or chapmen. (See further on this subject under the word BANKRUPT.)

BANK AND BANKING .- In a commercial sense, bank is a receptacle for money, to be always ready at the will or direction of the depositor. Banking, doubtless, first took its rise in the lending of money at interest; but the origin of this practice is so remote, that it does not come within the range of authentic history. From the restrictions laid by Moses upon the Israelites with respect to lending money at interest, we are justified in inferring that

# Bank and Banking

very great extent, and that much general distress was occusioned thereby. In New Testament times, we have evidence that a system of depositing money with persons at interest existed; as, in the parable of the Taisnis, the idle servant is rebuiked for not putting the money to the exchangers, and then, says the master, "I should have received mine own with most of the excitant that the state of the money dealings of the ancient Jews. In the time of Demosthenes, bauking operations were carried not a great extent in Athena. They exchanged foreign moneys, received deposits at interest, and gave loans. The rate of interest charged on loans is said to have been usually as high as 36 per cent. The bankers were generally of low origin, such as freedmen and aliens; but they frequently rose to great weath and eminence. One Pasion, a manumitted slave, is frequently mentioned by Demosthenessand contemporary orators, and more than once was the state indebted to his liberality. He is said to have owned land to the value of 20 talents (£4,287) in deposits from his sustomers. He (£12,187) of his own out at interest, and to have had 11 talents (£2,681) in deposits from his customers. He was a man of undoubted integrity, and his friendships and connections extended through the whole of Greece. The Athenian bankers are supposed to have been the first that invented the system of discounts, that is, of Inst that invented the system of asscounts, that is, or retaining the profits at the time of making the advance. The first mention that occurs of banking at Rome is in the year 352 B.C., when, the plebeians being in great distress, the state appointed certain persons to lend out the public money upon security; and this system was adopted from time to time, for a limited period, in times of monetary distress, throughout the republican period. Besides these, there were three principal classes of bankers at Rome: the Negotiators, holent money upon interest to the inhabitants of the provinces, by which means they were enabled to realize a larger profit (the Lex Sempronia de fanore, 500, was aimed at this), as they were not limited there by any laws. The private bankers, Argentarii, with whom individuals opened accounts (sense rationes, tabulus accepti et expensi), and by whose intervention (in fore et de mense acriptural) money was paid. They attended in particular to the payments of Roman citizens living in the provinces, as they might become due at Rome.—(Cio. ad Quint. ii. 12.) The Menserii, who were the bankers of the republic (Lex Minucia, 537), and were created for the purpose of abating usury:—"Novi consules remotrem quoque rem"—"levare aggressi, solutionem alieni wris in publicam curam verterunt."—(Lio. vii. 21.) Underthe emperors, the two words Argentarii and Mensarii were used without distinction. Thus C. Octavius, the Inther, is called Argentarius (Suet. Ang. c. 3), and Mensarius aimed at this), as they were not limited there by any without distinction. Thus C. Octavins, the father, is called Argenturius (Suet. Aug. c. 3), and Mensurius (ibid. c. 4, fin.). There was also a class of moneylenders of an inferior description, called Nummularioti.
The Nummularii were also a sort of bankers or dealers in money, who combined with their dealings the business of assayers; for which purpose they were apness of assayers; for which purpose they were ap-pointed to estimate the goodness or value of money, as to its weight, fineness of netal, and intrinsic worth. The Argentarii introduced one of the greatest con-veniences in banking,—that of making payments by means of cheques or written orders, called prescrip-tiones or attributions. During the Middle Ages, when commerce was but little developed, there was little field for harding cognitions but the having when commerce was but little developed, there was little field for banking operations; but the business was first established in Europe by the Lombard Jews in Italy, A.D. 809, of whom some settled in Lombard Street, London, where many hankers still reside. It seems to have been revived at Florence during the early part of the twelfth century. From the success that attended the commercial enterprises of the Florentines, that give heaven the continued that the continued the commercial enterprises of the Florentines, that give heaven the continued the commercial enterprises of the Florentines. rentines, that city became the centre of the money transactions of every commercial country of Europe, and her merchants and bankers accumulated great wealth. At one time, Florence is said to have had 80 bankers; and we find that between 1430 and 1433, 76 bankers at Florence lent the state 4,885,000 gold it was at that time a common practice among the florins. The earliest public bank in modern Europe was nation from which the Israelites came out. After the testing of the Jews from captivity, we read that the practice of leading out money at usury prevailed to a in order to extricate itself, had recourse to a forced florins. The earliest public bank in modern Europe was that of Venice, founded in 1157, or, as some say, 1176. It originated in the financial difficulties of the state, which,

104

# Bank and Banking

loan from the citizens, promising them interest at the rate of four per cent. The stock was made transferable, and a body of commissioners, called the Camera degli Imprestiti, was appointed to manage the transfer of stock and the payment of interest. This is believed to be the earliest instance on record of the funding system, and the first example it any country of a permanent national debt. This Chamber of Loans, as originally instituted for the purpose of managing the public debt, could scarfely be called a bank; and it does not appear to have carried on anything like a banking business for several centuries. Venice being the centre of an enormous commerce, thing like a banking business for several centuries. Venice being the centre of an enormous commerce, foreign coins, usually in a very worn or clipped condition, were in oirculation, to the great inconvenience of merchants; and hence the state had recourse to the expedient of authorizing the Chamber of Loaps to expedient of authorizing the Chamber of Loags to receive coins of all sorts, and to pay for them in notes an amount corresponding to the real amount of bullion deposited. These notes promised to pay the bester on demand a definite quantity of bullion of the proper fineness. The bank, however, does not seem to have discounted bills on its own account. Its only advan-tage was to save the wear and tear of the coinage, and to insure a uniform standard in mercantile trupsactions. Its notes always bore a premium as compared to the current money of the city; and it continued to exist until the fall of the republic in 1797. About 1350, the Cloth-Merchants of Barcelona, then a wealthy body, added the business of banking to their other commer cial pursuits; and in 1401 a public bank was opened by the magistrates of the city, which Spanish writers claim as being the first real bank in the modern sense claim as being the first real bank in the modern sense of the term. It received deposits, for which the public property of the city was pledged, and discounted the bills of merchants; but it does not appear that it issued notes or used cheques. Almost at the same time with the Bank of Barcelona, that of St. George, at Genos, was instituted. It was planned in 1345, but was not fully estublished and in operation till 1407. Like the Bank of Venice, it originated in the exigencies of the state. The republic had become indebted in large sums to a number of the citizens, and at length the whole was consolidated into one capital stock, to be managed as a bank, under the direction of eight pro-table tors. chosen annually by the stock-holders. This tectors, chosen annually by the stock-holders. This bank was pillaged by the Austrians in 1746, and never recovered its former prosperity. The Bank of Amsterdam was established in 1609, like that of Venice, to remedy the inconvenience arising from the great quantity of clipped and worn foreign coin that was in circulation. It received coins of all sorts at their weight in oullion, and, after deducting a small per-centage for the expenses of coinage and general management, gave credit for the remainder. It was enacted that all bills of 600 guilders (£52. 10s.) and upwards,—afterwards reduced to 300,—should be paid in bank money. It reduced to 300,—should be paid in bank money. It professed to lend out no part of its deposits, and to possess bullion to the full amount of the credits given in its books; but, when the French took possession of Ansterdam, in 1796, it was discovered that the bank had bettered to the state of the state Amsterdam, in 1799, it was discovered that the bank had lent uearly a million sterling to the States of Holland and Friesland; and this caused its ruin. In 1814 a new bank was established, called the Bank of the Netherlands. The Bank of Hamburg was founded in 1619, upon the same principles as that of Amsterdam, and has continued to flourish. The Bank of Stockholm was founded in 1668, and is remarkable as being the first, according to Law and Hume, that invented banknotes in Europe (the Chinese having the credit of having been the first to invent bank-notes, in A.D. 807).

Bank of England .- Previous to the formation of the Bank of England, in 1694, the business of banking in London was carried on by the goldsmiths, who bor-rowed money from their customers at a certain rate of interest, and lent it to government and private in-dividuals at a higher rats. The Bank of England was of interest, and lent it to government and private in-dividuals at a higher rate. The Bank of England was projected by Mr. William Paterson, a Sected gentle-man, and obtained its charter of incorporation on 27th July, 1984, in consideration of £1,260,000 (the then amount of its capital) being lent to government, who were to pay interest for the same at the rate of 8 per-cents, with a further allowance of £5,000 a year-for management. The first charter was granted for allows were certain; and it has been from time to first

#### Bank and Banking

renewed down to the present time. At each re some advantage was given by the Bank to the gover-ment, in the shape of an advance of money at a low r ment, in the shape of an advance of money at a dow rate of interest, or without any interest. In this way the debt due by the government to the Bank was increased in 1708 to £3,275,000, in 1738 to £9,100,000, in 1781 to £11,686,000, and in 1818 to £14,686,000. At the renewal of the company's charter, in 1833 (3 £ 4 Will, IV. 0 88), provision was made for repayment on the part of the government of one fourth part of the debt due to the Rank. This act directs that in future the Bank shall do. This act directs that in future the Bank shall deduct £120,000 a year from their charge, on account of the management of the public debt. At present the amount due by the public to the Bank is £11,015,000. In order to meet these several advances, the capital of the company had to be increased from time to time by new subscriptions. In 1708 it amounted to £4,402,243, in subscriptions. 1746 to £10,789,000, in 1782 to £11,643,400, and in 1818 to £14,563,000, which is its present amount. From its commencement, the Bank of England has enjoyed several important privileges. The chief of these was several important privileges. The chief of these was conferred upon it in 1708, by an act prohibiting any company of more than six partners from being estab-lished for the issue of notes payable on demand in England or Wales. This act was partially repealed in 1826, so as to admit of such companies being formed beyond sixty-five miles from London. The Bauk is expressly prohibited from engaging in any commercial undertakings, except such as are purely and legitimately connected with banking operations; such as the buying and selling of coin, bullion, or bills of exchange. By the original charter the Bank was allowed to issue notes or bills of credit to an amount not exceeding £1,200,000, the amount of its capital. At first, none of its note the amount of its capital. At first, none of its notes were below £20; but, in 1759, it began to issue notes for £10; and £5 notes were first issued in 1793. The act 7 & 8 Vict. c. 32, declares that from and after the alst of August, 1844, the issue department of the Bank of England shall be separated from the banking department. ment; that the issuing department may issue notes to the extent of £14,000,000, upon securities set spart for the extent of £13,000,000, upon securities see spart for that purpose, of which the debt of £11,015,100, due from the government to the Bank, shall form a part; that no amount of notes above £14,000,000 shall be issued, except against gold coin and bullion. From her first establishment down to 1797, the Bank of England had always been able to pay its notes regu-larly when presented; but in the early part of that year, in consequence of rumours of a French invasion, the demands upon the Bank for cash were so great, that on 26th February an order of council was issued, pro-hibiting the directors from paying their notes in cash until the sense of parliament was taken upon the subject. When the matter was brought before parliament, an act was passed continuing the restriction until six an act was passed continuing the restriction that six months after the signature of a definitive treaty of peace. A report, drawn up by a committee of the House of Commons, to examine into the affairs of the Bank, showed that she possessed a clear surplus, after meeting all demands, of not less than £15,513,690. This report, and the fact that Bank of England notes This report, and the fact that Bank of England notes became practically legal tender, restored confidence. In 1801-3, their issues are stated to have been so much increased, that the notes fell to a discount of from 8 to 10 per cent. In 1809-10, from the same cause, the discount rose from 13 to 16 per cent. The issues of country bank-notes were also much enlarged, and in 1814 the discount on Bank of England notes was as high as 25 per cent. In 1816, no fewer than 240 of the country banks stopped payment; and this, together with the declaration of peace, raised the value of the Bank of England note to nearly a pur with gold. In 1821, the directors resumed specie paywith gold. In 1821, the directors resumed specie payments. In the latter end of 1825, the demand upon the Bank for cash was so great, that the directors applied to government for an order in council restricting specie payments; but this the government refused to grant, and the pressure was at length got over. During man, and obtained its charter of incorporation on 27th the great commercial panies of 1847, 1837, and 1866, July, 1894, in consideration of \$1,200,000 (the then amount of its capital) being leat to government, who were to pay interest for the same at the rate of 8 per the directors, if necessary, to infringe the act of continuancement. The first charter was granted for an anagement. The first charter was granted for do; and on two of these occasions it was found eleven years certain; and the pressure was at length got over. During man, and the pressure was at length got over. During the grant, and the pressure was at length got over. During man, and the pressure was at length got over. person is entitled to demand notes from the issning person is ensuled to demand notes from the issuing department in exchange for gold bullion, at the rate of £3 17s. 9d. per curses. Should any banker discontinue his issue of notes, the Bank of England may, upon application, be empowered, by an order of council, to increase her issue upon researches to the extent of twocrease her issue upon "scorrities to the extent of two-thirds of the issue thus withfarewn; but all the profit of this increased issue must go to the government. In 1857 permission was in this way granted to issue an additional sum of £475,000; so that the Bank can now issue notes to the extent of £14,475,000, against which sum she has securities set apart for that purpose; and besides this, she can issue to the amount of gold and silver she possesses in terms of the above-mentioned act. By this act a weekly statement of the affairs of the Bank is required to be published in the London Gazette. Bank of England notes are declared to be a legal tender in all cases except when tendered by the Bank herself. All the notes which are at any time in circulation from the issue department must either be in the banking department, or in the hands of the public. The amount in the banking department is called by the directors "the reserve;" the amount in the hands of the public, "the active circulation." It is by the amount of reserve that the directors profess to regulate their changes in the rate of interest. the reserve is low, they increase the rate of discount; when high, they raise it. The amount of reserve de-pends chiefly upon changes made in the issue circula-tion;—when the issue circulation is high, the reserve is high; and when low, the reserve is low. The Bank of is high; and when low, the reserve is low. The Bank of England receives deposits, but allows no interest upon them, nor does she permit any account to be overdrawn. them, nor does sae permit any account to be overlawn. The rates of discount vary considerably, according to the state of the money-market; but, generally speaking, they average from 2½ to 5½ per ceut. Within the last few years they have been as low as 2 and 2½, and, in November, 1857, they rose as high as 10 per cent. The Bank transacts the whole business of the government. ment, and has always on hand a large amount of the public deposits, amounting sometimes to several milions sterling, on which she pays no interest. She receives the public revenue, and pays the dividends upon the national debt, for which she receives a certain annual per-centage. The profit on the issue department is the interest of 3 per cent. paid by government upon the £14,000,000 for which she has notes in circulation uncovered by specie. From this has to be deducted the cost of maintaining the issue, estimated at £113,000, and the sum of £180,000, which is deducted from the sum allowed for the management of the national debt, on account of the exclusive privileges allowed to her, and the exemption from stamp duties, leaving a clear profit of about £127,000. The Bank has also a profit of 11d. per ounce upon her bullion transactions; she also per ounce upon her bunken transactions, she also derives large profits, like other banks, from her deposits, with which she makes investments in public and private securities. The Bank of England is a central bank of deposit for all the London banks that are members of the clearing-house. They have all deposits here, and settle their claims upon each other by transfers to or from their different accounts. (New CLEARING-HOUSE.) The following is a statement of the affairs of the Bank for the week ending September 21st, 1870, issued pursuant to act of parliament:—

certain of the larger towns of Language, in order to extend to the provinces the advantages of a secure circulation. At present, therefore, there are branches of the Bank at Manchester, Swansea, Birmingham, Liverpool, Bristol, Newcastle-on-Tyne, Hull, Ply-mouth, Portsmouth, Leicester, Leeds, and at the west end of London. The weekly statements published include the whole catablishment,—the branches as well as the head office. The newton of rock issued in as the head-office. The payment of notes issued in London can be demanded only at the London office; but those issued at the branch offices may be demanded either at the cilice where issued or at London. The management of the Bank is, in terms of the original management of the Bank is, in terms of the original charter, rested in a governor, deputy-governor, and twenty-four directors. The governor must hold at least £4,000, the deputy-governor £3,000, and each of the directors £2,000 of the capital stock of the company. They are selected from the mercantile classes of London, virtually by the other directors, who form what is called a "House List," containing the names of certain persons whom they recommend as directors; and this recommendation is always followed by the proprietors. Thirteen of the directors, of whom the governor or deputy-governor must be one, form a governor or deputy-governor must be one, form a court, which meets every Thursday for the transaction of business, and for receiving a report of the state of the Bank for the preceding week. The court half-yearly declares to the stockholders the dividend due on the capital and profits. The committee of the treasury is composed of those directors who have held the office of governor, together with the existing omes of governor, together with the existing governor and deputy-governor, and the director who is intended to be the next deputy-governor. This committee meets once a week, and at such other times as it may be called together specially by the governor. It was the rule that every director should take his turn for becoming governor; but recently it has been determined to piace in that office him whom the other directors shall, by ballot, think the best qualified. Four general courts are held every year, in the mouths of September, December, April, and July. The secretary is the official organ of the corporation, and to him all correspondence should be addressed. Private Banks and Joint-Stock Banks .- The restric-

tion in favour of the Bank of England confining the number of partners in other banks to six, acted very numerous private banks, with not more than six partnumerous private banks, with not more than six partners, sprung up in various parts of England, and in 1792 their number is supposed to have exceeded 550. Many of them were destroyed by the crisis of that year; but, subsequently to 1800, they began rapidly to increase. In 1809 they amounted to 762, and in 1814, there were no fewer than 940. In the difficulties which followed, 240 of these establishments stopped varment. Since the abolition of the restriction to places beyond sixtyfix miles from London. tion to places beyond sixty-five miles from London, many joint-stock banks have been established in different parts of England, some with very large bodies of proprietors. The Bank Act of 1844 contained various enactments regarding private banks, by which they are at present regulated. It enacts that no banker, except he were issuing notes on the 6th of May, 1844, was in future to issue notes in any part of the United Kingdom, and the issue of each bank was to be strictly limited to the average amount of notes which it had in initiated to the average amount of noise which that in circulation during a period of twelve weeks preceding 27th April, 1844. Every issuing banker has to trans-mit weekly to the Stamp-office an account of his notes in circulation on each day during the week preceding. Banking companies on the joint-stock principle, but with the liability of the shareholders limited to the amount of the shares, may now be established in terms of the Limited Liabilities Act (21 & 22 Vict. c. 91); otherwise, holders of stock in any English bank, except the Bank of England, are liable, not only for the amount of their shares, but for the whole debts of the company, whatever may be their amount. ment of joint-stock banks in or near London had reference only to the issuing of notes, several joint-stock banks of deposit have been instituted since that stock banks of deposit have been instituted since that time. There are at present, in all, ninety-five joints stock banks of England and Wales, ten of Which are in London. Of those in the provinces, sixty-three are authorized to issue notes to the amount, "in all, of \$2,903,557. Besides: the Bank of England and its branches, there are, in all, in England and Wales, 392 banks and about \$40 branches. \*

Banks in Scatland.—The first banking establishment in Scotland was formed in 1695, under the name of the Governor and Company of the Bank of Scotland. The original capital was \$21,200,000 Scots, or £100,000 sterling, in shares of £1,000 Scots, or £53. 6s. 8d. ster-

#### Bank and Banking

ling. At present its subscribed ospital is £1,500,000, of which £1,000,000 has been paid up. It began to establish branches in 1896, and to issue notes for £1 in 1704. In 1727 the Royal Bank of Scotland was established, with a capital of £151,000, which has been increased to £2,000,000, all of which is paid up. The British Linen Company was incorporated in 1746, for, as its name implies, the purpose of undertaking the manufacture of linen; but these views were speedily abandoned, and it became a banking company only. None of the other banking establishments in Scotland are chartered, with limited responsibility; and hence the partners are liable for the whole debts of the company. The following table gives the names and various particulars regarding the banks in Scotland:—

Instituted. NAME.	Paid-up Capital.	Dividend Rate per Cent.	Share Paid. Price.
1695   Bank of Scotland   1727   Royal Bank   1746   British Linen Company   1810   Commercial Bank   1825   National Bank of Scotland   Union Bank of Scotland   Aberdeer Town and County Bank   1836   North Scotland Banking Company   1838   City of Glasgow Bank   City of Glasgow Bank   1838   Caledonian Banking Company   1838   Caledonian Banking Com	2,000,000 1,000,000 1,000,000 1,000,000 1,000,000	12 8 13 14 14 11 10 10 10	£. £. s. d. 100 275 0 0 100 175 0 0 100 287 0 0 100 281 0 0 100 280 0 0 100 235 0 0 7 15 0 0 4 8 0 0 100 216 0 0 100 183 0 0 21 7 6

and an authorized circulation of £337,038, suspended payments; but neither the note-holders nor depositors sustained any loss, the shareholders, about 1,300 in number, some of them very wealthy, being liable for all the debts. Soon after, unother Scottsin establishment, the Edinburgh and Glasgow Bank, having another in the state of £132 557, but the individual conditions of £132 557, but the individual conditions of £132 557. authorized circulation of £136,657, had to wind up its affairs, with the entire loss of its capital; but in this case an arrangement was made by which its authorized circulation was handed over to the Clydesdale Bank; so that it was not lost to the country, as was the case with the authorized circulation of the Western Bank. In both cases the stoppage arose from gross reckless-uess in advancing moneys. The Scotch banks all issue notes as low as £1. The issue is regulated by act & £ 9 Vict. c. 38, by which the power of issuing notes is confined to those banks that issued notes during the year preceding May 1, 1845, and the authorized amount of each is the average amount of notes that it had in circulation during that year. While the English jointstock and private banks cannot by any means exceed their authorized circulation, the Scotch banks can do so to any extent, provided they have at the head-office gold and silver coin to the amount of the excess of than a quarter of that of the gold. All the banks, except the Bank of Scotland, the Royal Bank, and the British Linen Company, are required to send snutually, in the month of January, a list of the names of all their partners, and such list must be afterwards published in some newspaper circulating in the town or county in which the head-office or principal place of issue is situated. All the banks have numerous branches throughout the country; so that there is hardly a town or village in Scotland without several of them. The number of such branches is in all about 600. The Sootch banks all allow interest on deposits, and even an the balances of current accounts. In 1858 the total amount of deposits in the Scotch banks was estimated at not less than £50,000,000. Besides making advances in the way of discounts and loans, they advance money in the way of unsounce and avenue, they suvenee money on what are called cash accounts or cash oredits. By this means, a person granting a bond, with approved securities, becomes entitled to draw upon the bank to the extent of the sum stipulated, and he makes deposits at his convenience for she liquidation of the same. forms the third class of the division. Were the duties. These accounts are balanced yearly, like current of banks limited to the safe-custody of money, they

In 1857, the Western Bank, with capital of £1,500,000, accounts. These cash accounts are found to be very and an authorized circulation of £337,038, suspended advantageous to traders, by supplying an additional advantageous to traders, by supplying an additional capital, for the use of which they pay only in proportion to the amount of it which they employ. Cheques are not used to nearly the same extent in Scotland as in England, accounts being generally settled by bank-notes. A merchant usually draws at once from the bank as much as he thinks that he will require during the day, and pays in what balance he may have in th

the day, and pays in what balance he may have in the afternoon. In this way, cheques are much fewer, and they seldom extend to shillings and pence.

Trisk Banks.—In 1783 the National Bank of Ireland was established, with similar privileges to those enjoyed at that time by the Bank of England. Its capital is £3,000,000 Irish, or about £2,800,000 string, of which £2,630,769 sterling is lent to the government. The "rest" formula from the accumulated profits is £1,043,000. formed from the accumulated profits is £1,043,000. The authorized issue of the bank is £3,738,000. It allows nne authorized issue of the bank is 23,735,000. It allows no interest on deposits. The other issuing banks of Ireland are the Provincial Bank of Ireland (founded in 1825), the National Bank of Ireland, the Belfast Banking Company, the Ulster Banking Company, and the Northern Banking Company. The aggregate authorized issue of all these is £2,616,000. The authorized issue of all these is £2,616,000. The authorized issue of each bank is fixed by the act of 1845; and all instead that make the addication to research. issues beyond that must be made against a correspond-ing value of bullion. The Irish, as well as the Scotch banks, issue £1 notes; and the joint-stock banks all allow interest on deposits. There are non-issuing joint-stock banks and private banks in Ireland; and there are numerous branches extending over the country.

From what has been already said, it will be seen that the term Bank is applied to establishments of very different kinds. Banks are usually divided into three classes, as they are merely for the custody or issue of money, or for both. The first class, or the banks of deposit, are, strictly speaking, those early banks which received money or valuables for custody, and kept them in their coffers till called for; but now the term is generally applied to those establishments that receive generally applied to those establishments that receive money from their customers and lend it out to others at a higher rate of interest. Banks of issue are those that issue their own notes for circulation; but as all of these, in this country at least, likewise receive deposits, the term is generally applied to what forms the third class of the division. Were the duties

would still be of immense advantage to the public. Every one who has had the east of large sume of money knows the againty which attends their catody, and the risks to which they see stillected; and hence the value of a place of security in which to lodge them. This gave rise to the first formation of public banks. But, were the money merely to his idly in the coffers of the bank, it is evident that the depositor would not only not receive any interest upon it, but would have to pay for the trouble and expense of keeping it; while the money thus kept was so much withdrawn from the trading capital of the country. The advantages of combining a system of lending money with that of receiving it soon became apparent; and banks were established for the purpose of both receiving and lending money; the interests received on the sums being considered sufficient to cover all expense connected with its management, or the risk of losing it; and, indeed, as already seen, almost all banks pay interest upon their deposits. By this means, numerous small sums of money, which would have remained unproductive in the hands of individuals, are collected into large sums, in the hands of the bankers, who employ it in granting facilities to trade and commerce, and in this granting facilities to trade and commerce, and in this way increase the productive capital of the nation. way merease the productive capital of the manon. Thus a million of money, in place of lying useless in small sums in the hands of the owners, or in one large sum in the coffers of a bank, is lent out to increase the capital of manufacturers and traders; and thus the world is made one million richer, or at least is saved from being one million poorer. Besides the money from being one million poorer. Besides the money which a banker receives in deposits from his customers, he must be pessessed of a certain capital of his own in order to carry on business, and to insure confidence in his stability; for no one would lend money to a banker if he knew that he was possessed of no capital. The interest derived from this capital forms part of the profits of the banker; but it is evident that the profit in this case is not the same as that which he derives from trading with the capital of others; in other words, that the interest is not greater than if he had lent out his money in any other way equally safe, and involving the same arount of trouble. The capital of the banker the same argount of trouble. The capital of the banker ought properly to be invested in government securities yielding three per cent., which can readily be converted into money in the event of an unexpected demand upon him by his customers for their deposits. The deposits, over and above a certain sum which he must have at hand to meet daily claims, he advances in various ways as loans. The best and safest mode of employing such as loans. The best and saiest mode of employing such funds is considered to be in the discounting of good mercantile bills of exchange; that is, bills representing bond-fide transactions of trade and commerce. A banker sometimes makes advances upon the deposit of exchequer bills or other government securities, railway debentures, bills of lading, dock warrants, and such-like; but, except the government securities, the others are generally avoided by prudent bankers. Loans are usually divided into short loans and dead loans, the former bankers are the strong a fixed time for their repayment, the former having a fixed time for their repayment, the latter no fixed time. Loans of the latter class are generally avoided. Advances upon deeds, except in agricultural districts, are always objectionable. If depositors have the power of demanding the amount of their deposits at any time from the bunker, while he usually makes his advances for a fixed or definite period, it is evident that he must always have on hand, uninvested, a considerable sum to meet such claims. The amount a considerable sun to meet such claims. The amount necessary for this purpose may generally be pretty nearly estimated. It depends upon a number of circumstances; as the state of the money-market, the cumstances; as the state of the money-market, the amount and nature of the deposits, the average amount of daily payments, and such-like. Is banker is at liberty to issue bank-notes to a certain amount, it is to the interest upon the difference between the average amount in circulation and the amount of specie required to be kept on hand to meet them, less the expense of their manufacture. If, however, a banker were obliged to kep deadstock or bullion equal to the amount of his notes in circulation, he could make no profit. But for a banker in good credit it is considered that a fourth or a fifth part of this sum is usually sufficient. Besides creving as places for the safe-cuatody for money, and allowing interest on deposits, banks are of great use

in affording a safe and rapid transference of money from one place to another. A debtor in Edinburgh, or Dublin, pays to his banker there the sum which he wishes to possey to his oreditor in London. The banker, for a small commission, furnishes him with a draft or letter of credit for the amount, to be paid by a banker is London, from whom the creditor, on presenting the draft, seesives the smount. Thus, then scanser is London, from whom the creditor, on pre-senting the draft, receives the smount. Thus, then the disposable means of a bank are,—1. The amount of paid-up capital; 2, the amount of money lodged by oustomers; 3, the amount of receives in since land of the conon pand-up capital; we the amount of money logged by the amount of money in course of transmission, that is, money received for the purpose of being repaid is some distant place at a future time. These means are employed,—1. In discounting bills; 2. in advances of money in the form of cash credits, loans, or overdrawn accounts. 3 in the contract of the country of accounts; 3, in the purchase of government and other securities; 4, a part retained in till to meet gurrent demands. Of these four ways of employing capital, three are productive, and one, namely the last, unproductive. The profits are that portion of the total receipts of the bank, including discount, interest, dividends, and commissions, which exceeds the amount of the expenses. A greatsaving is also effected, by the use of notes and cheques, of wear tear, and upon the coinage of the country. Frequently the banker performs the duties of cash-keeper to his depositors, making all their money payments beyond their small daily expensively. diture, and receiving the money payable to them. The merchant, by sending all the bill-due to him to his banker, to be presented, and noted it not duly paid, is saved a great amount of trouble, and the risk of making mistakes in the presentation of the bills, the banker being always liable for any mistakes that may be com-mitted through him. But it is in the use that the banker makes of the money that is intrusted to him that he is of the chief benefit to society,—in his loans, discounts, and eash credits. It is here that he requires to exercise his greatest ability and skill, he requires to exercise his greatest shifty and skill, so that he may be the means of furthering the prosperity of the country, by aiding honest industry, and exposing regnes and reckless speculators. "From motives of private interest," says Gilbart, "they (the bankers) encourage the industrious, the prudent, the punctual, and the honest; while they discountenance the spendthrift and the gambler, the liar and the knave. They hold out indusements to uprovidings, which are They hold out inducements to uprightness, which are not disregarded by even the most abandoned. There is many a man who would be deterred from dishonesty by the frown of a banker, though he might care but by the frown of a banker, though he might care dutitle for the admonitions of a bishop."—Hef. English Cyclopædia—Arts and Sciences; McCulloch's Commercial Dictionary; Gilbsr's various works on Banking; Dunning McLeod's Theory and Practice of Banking, and Dictionary of Foitical Economy; Lawson's History of Banking; Smith's Wealth of Nations.

BANK-NOTE MANUFACTURE.—In order to prevent the forgery of bank-notes, a great deal of ingenuity and art has been expended on their production. The principal features of the manufacture are,—a peculiar kind of paper and water-mark; an elaborate design, printed with a peculiar kind of ink, and certain private marks, known only by the bank officials. Until 1837, marks, known only by the bank officials. Until 1837, bank-notes were produced by copper-plate printing; after which time, by means of Messrs. Perkins & Heath's invention, they were reproduced without fresh engraving. They employed the following method:— The note was first engraved on a soft steel plate, which was afterwards hardened. The impression was then transferred to a soft steel roller, which, in its turn, was stanserred to soil seer roller, which, in he darm, was also hardened, and the impression remained there, in relief. From this roller any number of freshly-engraved plates could be produced. In 1855 Mr. Smee, the surgeon to the Bank of England, introduced the

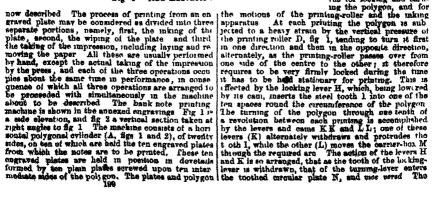

#### Bank-Note Printing

engraved plates, as forming a butter prote fraudulent imitation; but the slowness an increased expense of this manner of prim dion se pared with ardinary type in some instances, to the liner some instances, to the finite and better protective pro-cess. Improvements of a timer churacter hape been made from time to time in the process used from practing from suggested pulses; and the note printing press of the late Mr. John Oldham, leng in use in the Bank of Ireland, and subsequently in the Bank of England, may be mentioned as, perhaps, the best example. But any attempts to abridge the labour and tune of the operation by inking the sugraved plates by means of machinery, appear to have failed entirely greated to Mr. Grubb's machine, which is

### Bank-Note Printing

by states, successed and the localizary rate or working, such impression occupies her neconits, and the polygon is held stationary during eight securit of the time, and during the remaining time secondary is bursed round, through one-touth of a mechanica, in the direction shown by the strew is ig. 1, so as to brung the east engraved plate to the top for being printed from Dungs the sight seconds that the polygon is stationary, the undermost plate at C is faked by the machine, the uppermost plate at C is faked by the machine, the uppermost plate at C is faked by the plate at F has the wiping of its surface completed. The machine requires two attendants, one standing in the box F, who lays the paper, removes it alter being printed, and observes that the work is proceeding satisfactorily, while the other gives the final wiping by hand to the surface of satisfactorily.

final wrping by manu to surface of saids plate as as toomes not the position R, fig. I The greater-portion of the superfluors ink is wiped off by the machine, thereby intenting the labour of the final winng the labour of the final winner the labour of the labour of the labour of the final winner the labour of the bour of the final wigning by hand thus is duse by means of the wiping-volue. G. on which is wound a length of cotten dicht. This wiping-relies is sta-tionary while the edygon is at rat; but on the poly-ce heartman to move is at rea; but on the pur-gon beginning to move, the roller presses symmet the surface of the pre-viously-inted riste, and, by turning in the appoints direction, whose off the superfluous ink. When the surface of this roller be-comes surcharged with ink, a length of the cotton cloth upon it, equal to one round, is torn of. By the revolution of the polygon, therefore, each plate on arriving at the notion (at C) is mked, and as it pro-ceeds upwards is first partrally waped by the machine at G, and afterwards final y wiped by hand at E; and, on arriving at the top, is printed from - by the printing-roller D Several printing-roller is reversal special contrivations are required for producing the respective actions of the machine, the principal of which are the apparatus for looking and turn-

on the inking time takes up a fresh supply on is turned through one-tenth of to bring the next engraved plate ready to be inked when the mking main by the lever G. As the mk is the perforated inking table P to the in a series of dots through the holes ie, the engraved places would be inked in one management, one engraved plates would be inked in a simplifit, and therefore imperfect, manner, but this is prevented by the application of the two small distributing collers I I, which are pressed in contact with the intragradiers imply revolves in contact with the intragradiers imply revolves in contact with the intragradiers imply revolves in contact with the intragradiers, but the other has on one of its bearings a major, which even it is need. summary rower, Dut the other has on one of its bearings a samen, which gives it an end-traversing motion, in addition to the rotary motion, and thus the ink conning to the solder in dots, is equalized over its entire surface, and the inking of the engraved plates is rendered subtrouch all over. The occasional seconds of the Hos. and the mining of one engraves places as consequently addressed ink from the surface of the inking table P is provided for by the arrangement shown in fig 7, Plats XVIII. The ink-soraper J is shown in the position where part of notion, and H is the lever, and M the eting-rod for communicating the required motion to it from the cam N On the scraper beginning to \$6 if from the cam N On the acraper beginning to neave across the inking-table P, from the position shows at J in the drawing, a small cam at each end outside it to rise, and so to pass clear over the abd without acraping, while in the return motion the acraper descends into contact with the table, and pushes before it the thickened ink, which falls into a trough prepared to receive it It the coraping were to be performed once for every impression printed, these it would only be required to allow the cam roller at the end of the level H to remain continually in the groove of the card N But as it is required that the strument should be performed only occasionally, or consider every thirty an impressions or revolutions of the cameakst, the following arrangement is adopted the came that, the following arrangement is adopted At O is a latch, which, so long as it is not raised, holds the connecting for M, pushed outwards laterally, so that the cam roller is out of the cam groose N. The raichet-wheel Q has severity two teeth, and as carried forward, one tooth for every impression, by the paul R, which is actuated by the cam shown by the dotted line. Attached to the ratchet-wheel is a directly large only two notches (TT) in its circumference, and U is a rocking-frame, locking on a pun at its lower end, and having on the upper part a precting finger which is caused by the weight W to press continually against the edge of the disc S. V is a bolt worked up and down at each revolution of the cam shaft by the same lever and cam that works the paul R of the ratchest-wheel. The upper end of this bolt shdes in the raisking-frame U, and so long as the finger is on rateint-wheel The upper end of this boil since in the resking-frame U, and so long as the finger is on the adge of the disc S, the boit V rises and falls just clear of the latch P, as shown in the drawing, so that it produces no action. But once for every thirty six impressions of the mechine, the finger of the rocking frame U enters one of the notches (1) in the diss, and rapressions of the mathine, the finger of the rocking frame I eakers one of the notches (1) in the disc, and the rocking-frame falling forwards, titls the bolt V into the position indices of by the dotted line, when the next rising of the bolt hits the latch O, as shown by the detailed line. The cam roller is now thrown into the camproner N by the lateral pressure of the siving lever M, and the scraping of the inking-table P is perfumed once by the revolution of the cam. At the end of the seventy is the camping of the seventy of the inclined stop X at the end of the swanginger N by the inclined stop X at the end of the swanginger N by the inclined stop X at the end of the swanginger N in intantly held out by the dropping of the latch B; and before the bolt V again races, the race of the noteh T, and therefore the bolt V rass sleep of the noteh T, and therefore the bolt V rass sleep at the finger of the rocking-frame U is again to the fine noteh T, and therefore the bolt V rass sleep at the latch O, and cases to life it for the next third-six impression. If T. Thomas Grabb that it is planning, and also in the construction of the engineer planning, and also in the construction of the engineer machine, he has derived much OCCUPI

by expensive mechanical alterations of the being done and efficiently; and this system spectron, the data for the requi everal cams, and for keeping t their shafts in the exact positions i recourse to tentative trails. When the interest occasion to bring this machine under the m Institution of Mechanical Engineers at Ethe president of the sourcey, Sir Joseph a spoke of it as being beautifully contain purpose for which it was designed. He immelf as much struck with the simplicity struction and the sourcey of its working, attack that two of the machines above delicated that two of the machines above delicated. been in constant use at the Bank of Ireland fourteen years with starcely any repairs.

Bank-Nors Engraving —We have now

HAME-FORE ENGLAVING — We are new to the manner in which the plates are engraves separate subjects or designs forming the thank-note are engraved by hand, in the first bank-note are engraved by hand, in the first hardened, and are preserved as the permuse terms, not to be printed from The engrave them transferred in relief to the surface of a contract of the surface of the surfac rollers, by rolling these over the pattern blood a heavy pressure, and these rollers are sale hardened so as to be used as dies to unpress narcened so as to be used as dies to impress in graving upon the printing-plates in a similar tea to that long employed for engraving the ex-conductor used in calico printing, but requising greater amount of accuracy in the present insti-llate engraved plates for printing the bank-more made of soft steel, and are never handlessed being engraved, because, being of large size-30 long by 6 inches wide,—they would almost en not retain their flatness in hardening. Most not retain their flatness in hardening. Miniscrep, when worn in printing, the soft plates are easily repaired again by means of a special arrangement that the inventor has designed for the purpose, which enables the roller to be applied again to the plates with perfect accuracy for renewing the impression. In first impressing the plate with the master roller, or die, the plate is fixed upon the table of a strong pressing machine capable of exerting a pressure up to five tons, regulated as required by means of a weighted lever, and the position of the results of the results of the second of the property of the second of the position of the pression of the position of the pressure of the second of the position of the pressure tons, regulated as required by means of a weighted lever, and the position of two register-points in this plate being accurately noted by means of a milero-moter microscope, are registered in a best kept for the purpose, the master roller is then passed over that plate by the muchine under the heavy pressure, being very steadily guided by a special parallel-mixtum ar-rangement with pressure sectors similar in principle to those of the note princip machine aircant disrangement with pressing sectors similar in principles to those of the note principle accepted. The table is provided with complete adjustments of very great delicacy, and the pressure of the engaving-roller upon the plate is not produced by the roller descending upon the plate, but by the table being raised up to the roller. The table being if considerable weight, is belianced, so that it is moved vertically with a force of a few pounds; and it is proved the produced by the transport learn arms of the produced of the transport learn arms of the produced of the pounds; and the produced of the produce successive weight, in consument, so these is a provided with two separate lever-acrangements—one for light, and the other for heavy pressure which they pressure, from a few pounds up to the first home, can be put upon the plate. For renewing the impression upon any subsequent coorsion, the plate is again fixed to the table, in exactly the same position as befure, by means of the micrometer nucroscope and the register of its position, and the roller is these peaked over it again to deepen those parts of the impression which have become worn up printing.

BANKEUPT, bank-raps (Fr bang-servicines, bangiarouts) Ital banco rotto)—The table of the first linghab scattle relative to bankrupta,—the 34 Han, VIII, a. 4, which is said to be against "such persons as do make hank-raps," in a lateral translation of the Franch upon any surface from bangua and rouse, i.e. waters any some form bangua and rouse, i.e. waters and translation of the Franch upon. Thus a mark-annel is the sign where the reak or sign. Thus a mark-annel is the sign where the

Banneret

cart-wheel has gone; and benings is metaphorically of a table once taken from the sign left in the s fastened to it and telem swar. m is the earth, of a table once though The original seems to Romen backers or money-di, who had their tabernas and changers, called Messaget, who had their fabricas and messad, their booths and tables,—in certain public places (see in Relysiand Spain, they now have, or lately had, their openly in the market-places); and, when they fathed sad find, they left only the signs of their banks, henches, or tables, behind them. The use of they famed san buck, say, behind them. The use of banks, benches, or tables, behind them. The use of tables by signey-changers also prevailed in the time of our fameur. (See Matt. xr. 12.) Others derive the word from the Italian bunce rotto, broken bench; it being the custom in Italy, when a banker failed, to break his person to whom the bank belonged was no longer in a condition to continue his business. The land of Elizabeth was the second English statute, all ionger in a condition to continue his business. The Sind of Elisabeth was the second English statute, all the provisions of which were incorporated in 1 James I., which was for a considerable period the leading act re-lating to participate. According to these statutes, a bankrupt was considered a criminal or offender. In 1731 an act was passed, by which a bankrupt who secreted his property or books was made punishable by death: and John Perrot was, under this law, hanged in 1761. At the present time the laws of bankruptcy are calculated to operate for the general benefit of trade, but nevertheless they impose penalties on fraudulent or dishouest persons. Before "the Bankruptcy Act, 1861," only certain traders could become or be made bankrupts; and relief to persons in difficulties or in confinement, and not sub-ject to the law of bankruptcy, could only be obtained under the provisions of various acts of parliament passed from time to time for the relief of insolvent debtors. But by this statute, sec. 69, all debtors, whether fraders or not, are subject to its provisions; but a non-trader cannot be adjudicated bankrupt, unless, with intent to defeat or defraud his creditors, he shall rt the realm, or, being out of the realm, with such est remain abroad; or with such intent make any fraudient conveyance, gift, delivery, or transfer of his real or personal estate; or unless he commit the other agts of bankruptcy after-mentioned; and, by the same statute, it is enacted that the following shall be considered acts of bankruptey:—a trader lying in per considered acts or burning or a trader for two calendar months, or, in either case, escaping out of prison; a debtor, whether a trader or not, filing a declaration that he is unable to meet his engagements; decination that he is unable to meet als engagements; trader debtor suffering an execution to be levied; any debtor, on being summoned in respect of a debt amounting to £50, and not paying the debt and costs, or scarring or compounding for the same to the satisfied of the creditor. And any debtor may petition for adjudication of bankruptey against himself. In cases where persons are imprisoned for debt, a registrar is to attend at the gaol, and examine the prisoner, and, after the expiration of fourteen days, or two calendar months, as the case may be, and as before mentioned, he may make an order of adjudication, grant him protection, and order his release. If the prisoner retime to conform, or to sign his examination, the court may commit him to the common good of the county, there to be kept, with or without hard labour, for any time not exceeding one month. The object of the statute is to administer the whole of the bunkrupt's estate for the benealt of his creditors, to discharge him from insprisonment and further liability, on his fairly and housely fiving up his estate, and making a full disclosure of his allure. But, on the other hund, it heclares the bankrupt shall be guilty of a misde-nession, and be hable, at the discretion of the court refore which he shall be convicted, to imprisonment netone which he shall be convicted, to imprisonment for not mines than three years, or to any greater punishment attached to the offence by any greater punishment attached to the offence by any gristing statuta, for either of the following offences:—If he shall neglect to surender or be examined, or refuse to or not fully discover his property and the mode of its dispuss; or, after adjudication, or within sixty days prior thereto, with intent to defraud his creditors, remove, orangest, or subsessie any part of his property and the state of side or newerfas; or not disclose, within remote, consest, or emiserate any part of his property to the sales of \$10 or upwards, or not disclose, with one manish after. his knowledge or belief that a faise data ass facin proved under his bankruptey; or wil-felly or frami remaily omit from his schedule any effects 202

sel or withhold the production of paper, or writing of a or affairs; or, after o distinction, account any b property, designed, or efficient of after or within three months, before adjudication, concean, destroy, siler, mutilate, or falsify, any book, paper, withing, security, or document relating to the setate, destings, as efficient, or make, or be privy to the making, of any false or fraudulent entry in or omission from, any most, paper, document, or writing relating theretay on, within the like time, knowing that he is unable to most his encountering fraudulently and with injury to district. gagements, fraudulently, and with intent to diminish the sum to be divided amongst the general budy of his creditors, have made away with, margaged, encom-bered, or charged any part of his property; or if, siter adjudination, he shall conceal any debt due to ar from him. Similar penalties attach to a trade of the fal-lowing cases:—If he shall, under his baskrugter, or at any meeting of his creditors within three months next preceding the fling of the petition for adjudication, have attempted to account for any of his pro-perty by fictitious losses or expenses; or if, within the like time, under the false colour and pretence of carrying on business, and dealing in the ordinary course of trade, have obtained on credit from any person, or trace, have obtained on credit from any period, any goods or chattels, with intent to defraud; or, with intent to defraud his creditors, within the like time, pawn, pledge, or dispose of, or otherwise than by bond-fide transactions in the ordinary way of his trade, bond-fide transactions in the ordinary way or any example, any of his goods or chattels which have been abtained on credit and remain unpaid for. Although the attaite contains 232 sections, the former laws applicable to bankrupt traders remain in force, except where they are altered by the law now under notice. The whole of the bankrupt's effects pass to his assignees, and he is bound to assist them by making such disclosures as will enable them to divide the same amongst his creditors. In a work of this nature we cannot enter more fully into the law of bankruptcy; nor should we have treated of it at such length, except for the radical change effected by the late statute. (See Assignment of A BANKRUPT. BANKS, SAVINGS. (See SAVINGS BANKS.)

BANKSIA, bank'-si-a, in Bot., a gen; of plants belong-ing to the nat. ord. Proteucew, and so named in honour of Sir Joseph Banks. The species are bushes and small trees, found in all parts of Australia. They have hard dry leaves, dull green above and almost white beneath. The branches bear, towards their extremities, long heads of very numerous flowers. The flowers scorete much honey; hence the name honeysuckle-trees commonly given to these plants by the colonists. Several species are much sultivated in British conservatories.

BANNATYNE CLUB, bin'-à-tine, a literary chub in-stituted at Edinburgh, in 1823, by Sir Walter Scott, who was its first president. It takes its name from Who was its first presument. It takes its mainter aroun George Bannatyne (1545—1607), compiler of the cele-brated MS. in the Advocates' library, entitled, Corpus Precision Scotorum. It consisted originally of only 31 members; but as many persons of rank and literary distinction were auxious to join it, the namber, in 1823, was increased to 100. Its object is the printing of rare works illustrative of the history and antiquities of Scotland, for distribution among the members, each of whom pays an annual subscription of five guiness Since its commencement, it has published upwards of 100 quarto volumes of rare and interesting works.

100 quarto volumes of rare and interesting works.

Bannes, bān'ner, is a piece of cloth stached to
the upper end of a pole or staff, and mustly bearing
some device or emblem. Banners or standards have
been in use from the earliest times. We find them
mentioned in Numbers ii., where the children of issued
are disected every man to "pitch by his own standard
with the ensign of their father's house." The earliest with the ensign of their father's house." The sarliest standards were probably not banners, but representa-tions of some animal or other object fixed un the top of a pole, as the Roman eagle or the Attentan owl. The chief use of the standard or banner in all times The chief use of the standard or beamer in all times must have been to serve as a rallying-point to soldiers in battle. Hence they have always been regarded as an emblem of national bonour, which the warrior was ever ready to defend at the risk of the life; and bence, banners taken from an enemy have always been regarded as special trophics of victory.

Bannauer, ban-ner-et, was the title of a knight who was entitled to been a beamer in the field, or who

Bannock

Baptistery

was able to bring into the field a sufficient body of men to have their own leader. The hanceret was created on the field of busile, on account of distinguished ser-vices. He took precedence of all other knights after barons. The dignity has not been conferred for a long

barons. The dignity has not been conferred or a long time. Its origin is of uncertain date; but it was pro-bably created by Edward I.

Blass or Markians, dans, the public proclama-tion of the names and designations of persons about to be married, made in church; the object being that those who have objections to the marriage may have an opportunity of stating them. According to the law of England, the proclamation must be made on three successive Sundays in the church during the time of successive Sundays in the church during the time of the celebration of public worship; and if the marriage be not performed within three months after the last proclamation, the same process must be repeated. The proclamation, the same process must be repeated. The proclamation of banns may be dispensed with by obtaining a disease from some one authorized by the bishop of the discess to grant it, by a special license granted by the archinshop of Canterbury, or by a certificate from the superintendent registrar of the district. (See LIGENSE and MARKIAGE.)

BANQUETE, ban-kell, in Fort., is a step or small terrace of sarth constructed along the inner side of a parapet for the musketeers to stand upon when the parapet is too high to fire over. It is usually made about four feet wide, and raised to within 41 feet of the crest of the parapet.

BANTAN COCK. (See COCK.)

BANTAN COCK. BANTAN TERE. (See Ficus.) BAOBAB-TREE. (See ADANSONTA.)

BAPHA, bif'-i-a, in Bot., a gen, of plants belonging to the nat. ord. Legaminasæ, sub-ord. Casalpinicæ. The species B. nitida yields the dye-wood known in commerce as bar-wood or cam-wood. This dye-stuff is employed, in conjunction with sulphate of iron, to broduce the dark-rest colours of the Funlish bardens.

is employed, in conjunction with sulphate of fron, to produce the dark-red colour of the English bandana handkerchiefs.

BRYGOMET, biff'-o-met, the name of a mysterious symbol, or idol, which the Templars were accused of worshipping in their secret rites. The term is generally supposed to be a corruption of Mahomet, to whose faith the members of the order were accused of having an inclination. You Hammer, however, derives the name from the Greek happhe, haptism, and metis, wisdom, and believes that it denotes certain small human fewers. Found in some of the continental collections. Agures, found in some of the continental collections, with two heat..., and covered with emblems.

BATTISIA, bap tis'-i-a, in Bot., a gen. of plants belong-

ing to the nat. ord. Leguminosa, sub-ord. Papilionacca. The species are numerous, and chiefly natives of North B. finctoria is the wild indigo of the United America. States, yielding a bine dye, resembling, but much in-ferior to, indigo. This plant is used medicinally; the root and herbage being stated to possess antiseptic, sub-astringent, cathartic, and emetic properties.

Barriage by claims (Gr. buptize, I wash or dip), is a sacrament of the Christian church, consisting of the application of water to a person in the name of the Father; the Son, and the Holy Ghost, by which he becomes initiated into the visible church. It is an interest and in the church. institution ordained by Christ himself, when he commissioned his disciples to go and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Hely Ghost. The rite, however, is believed to be much more uncient. Baptism, or purification by water, is said to have formed part of the ceresnony of admitting procedures into the Jewish church; and it is also said to have been the first cerecontrol, such its made said to have been the first cere-mony performed at initiation into the Eleusinian mysteries. Doubtless, as a fit and natural emblem of purification, washing by water may be supposed to have axisted from a very early period. Grotius, indeed, is of opinion that it derived its origin from the Deluge, is or opinion that is derived its origin from the Delingo, having been instituted in memory of the world having been purified by water. Various controversies have arisen in the Church as to how baptism is to be administered, and who are the proper subjects of it; whether it is to be done by sprinking, by affusion or pouring, or by immersion or dipping; whether it is to be administered only to admit, or also to infants. The Baptists are the most important sect that hold to adult baptism and immersion. (See Baptists.) There is no direct evidence to be obtained in Scripture on 203

any of these points. It is even doubtful whether in-fant haptism was precised in the earliest age of the Church. According to Neander, "baptism at first was administered only to adults," and "there does not appear to be any reason for deriving infant baptism from an apostolical institution." It is first alluded to by Irenseus, and was efterwards strongly opposed by Tertullian, a proof, eave Nounder, "that the practice was not universally regarded as an apostolical institution." The doctrine, however, continued to gain ground in the Christian church; but it was not till about the 5th century that it was fally established. Infant baptism, however, seems to be in accordance with the general spirit of Christianity, which makes the children partakers of the blessings bestowed makes the children purtakers of the blessings bestowed upon their purents, and to be a necessary consequence of the doctrine of original sin. We also find the apostles baptizing whole households, of whom it may readily be supposed that infants formed a pert. Many writers, too, regard haptism as corresponding with circumcision in the Jewish establishment, being the badge of distinction between the Church and the world; and hence some of the fathers have held that it should not be administered till the eighth day. In the primitive church, the office of baptizing was vested principally in the bishops and priests, or pastors of the respective parishes; but, with the consent of the bishop, it was allowed to the deacon, and in cases of necessity, even to laymen to baptize. It was administered only on the two solemn festivals of the year, Raster and Whit-suntide. The place of baptism was at first unlimited, but afterwards baptisteries, or fonts (which see), were erected in or near churches for that purpose. By the Church of Rome baptism is defined to be "a sacrament instituted by our Saviour, to wash away original sin, and all those we may have committed; to communicate and all those we may have committed; to communicate to mankind the spiritual regeneration and the grace of Christ Jesus, and to unite them to him as the living members to the head." In the Articles of the Church of England baptism is said to be "not only a wign of Profession, and mark of difference, whereby Christian men are discerned from others that be not obtained; but it is also a sign of regeneration, or new birth, whereby, as by an instrument, they that receive baptism rightly are grafted into the Church: the promises of the forgiveness of sin, of our adoption to be the sons of God by the Holy Ghost, are visibly signed and scaled, faith is confirmed, and grace increased by vistne of prayer to God." The Church prescribes that baptism prayer to God." The Church prescribes that baptism be administered only on Sundays and holyduys; except in cases of necessity. She requires sponsors for infants,—for every male child two godfathers and one godmother, and for every female child two godmothers and one godfather. Some of the early Church believed that baptism had the effect of washing away all previous ain, actual as well as original; and hence the administration of it was sometimes deferred till near the close of life, that all their transgressions might thus he removed. thus be removed

BAPTISTERY, Läp-tis'-ter-e (Gr. haptisterion, a large basin or bath), the name given to the building in which the sacrament of baptism was administered in the early ages of the Christian church. They were at first separated from the churches or basiliess to which they belonged, as they were required to accommodate a number of adult persons desirous of receiving the rite, and who were subjected to total immersion, after the manner in which John the Buptish baptised in the Jordan, at certain times appointed for the purpose. Jordan, at cartain times appointed for the purpose. They were circular in form; but at first were constructed in an hexagonal or octagonal shape, pared with marble, with large basins of the same material, generally three feet deep, either raised above the surface of the pavement and entered by steps, or sunk below its level. Some were of most staborate affoliated and the sunface of the pavement and entered by steps, or sunk below its level. Some were of most staborate affoliated and design; such as the circular baptistery of Pisa, 116 feet in diameter, three stories in height, and surmounted by a dome; and the haptistery of Florence, built of black and white marble, 100 feet in diameter, and magnificently adorned with mosaics by Andrea Tash, and bronze doors of beautiful workmanship executed by Andrea of Pisa and Lorenzo Ghiberti. The largest ever built is the one attached to the church of St. Sophia, at Constantinople: Other baptistevies of note are those of S. Giovanni in Foate, and S. Gio-

vanni Laterano, at Rome; and those at Ravenna, Asti, vanni Laterano, at Rome; and those at Ravenna, Asti, and the principal cities of Tuscany. It is supposed that the polygonal chapter-houses attached to English cathedrals were once baptisteries, and it is probable that the stone edifice at Glastonbury known as the Abbot's Kitchen served for a similar purpose. The places provided in Baptist chapels for the total immersion of adult members of that body are called baptisteries.—Ref. Bayling Cyclopadia.—Arts and Sciences. Barrasse, high-first, a religious sect, who hold that haptism is not to be administrated to adults but only

haptism is not to be administered to adults, but only saptism is not to be administered to maints, our only salter a peraopal profession of faith, and that it is to be administered by immersion, not by sprinkling. The question of infant baptism (see Barrism) sgitated the Church at a very early period, and about the end of the 2nd century Tertulian declared against it. Beveral of the later fathers entertuined similar views; but the destribute of infant harding continued to appead but the dectrine of infant baptism continued to spread, and in the 5th century the opposite opinions were condemned as heretical by several councils. In the Middle Ages, the doctrines of the Baptists continued to gain ground notwithstanding persecution; so that, according to Mosheim, the number who professed them in the beginning of the 12th century amounted to 800,000. From this time to the commencement of the Reformation, Germany was the chief seat of the Baptists, whence they spread over Holland and other parts. Little, however, is known of them in England parts. Little, however, is known of them in England before the 16th century. They were persecuted in the reigns of Henry VIII. and Elizabeth, and several of them suffered at the stake. The first Baptist church was formed in London in 1608, and in 1851 they had in England and Wales no fewer than 2,789 places of worship. In Scotland and Ireland, they have also worship. In Scotland and Ireland, they have also many places of worship; but in the United State they are much more numerous, constituting the most numerous denomination in the country, with the exception of the Methodists. Though all Baptists agree in holding that baptism is only to be administered on a profession of faith in Jesus Christ by the recipient, and that the only acriptoral mode of administering it is by immersion, yet they differ among themselves on many immersion, yet they differ among themselves on many other points, and are split up into several minor sects. The chief body in this country are the Particular Baptista, who are Calvinistic in their views, and hold that Christ died only for an elect number. The General Baptists maintain that Christ died for all men; and these are again divided into the Old Connection or Unitarian, and the New Connection or Trinitarian, the latter by far the more numerous. There are likewise several smaller seets. Baptists differ among them-selves also as to the admission of those who have not been baptized in their way to communion with them at the Lord's table, and to membership; the one class being termed open, the other strict, communionists. The Baptists were smong the foremost in the field of foreign missions, and they have ever been very zealous in that cause. They have colleges at Bristol, Bradford, Pontypool, Haverfordwest, Nottingham, and Regent's Park, London.

Bar, bar (Ang. Sax. bairgan, beorgan, birgan, byrgan), literally, to prevent, keep out or obstruct, to guard, to secure, to fortify, to prohibit.

Bar, in Mus., a perpendicular stroke drawn across

portions or a piece of music, to divide it into equal portions or measures of time. According to Sir John Hawkins, the use of bars is not to be traced further back them 1874, though bars are to be found in the "Ayres and Dialogues" of Henry Lawes, published in 1841. the lines of a piece of music, to divide it into equal

Bas, in African traffic, is used for a denomination of price; payment being formerly made by the negroes almost wholly in bers of iron.

Baz, of gold or silver, is a lump or wedge from mines

BAE, in Her., one of the nine honourable charges or figures placed upon the field or escutcheon, called orfigures piaced upon the field or escutcheon, called ordinaries, and consists of two lines drawn across the field. It differs from the fess in this: the fess occupies a third part of the field, and is confined to the centre; whereas the bar contains only a fifth is not limited to any part, and is never borne singly. It has two diminutives,—the sloset, which is half the width of the bar, and the degrute or derrulet, which is half the width of the bar, the closet. Of the closet, there may be five in one field, or, with regard to cities, a tower or outwork placed at

but the barrulet can be borne only in couples. Bare-genelles are so called when they stand in couples, When the shield contains a number of bare of metal and colour, alternate, of even number, that is called barry

colour, alternate, of even number, tax is called boarry of so thany pieces; as, barry of six argent and gules.

Bar, in Phys. Geog., an obstruction, consisting of sandbanks or roaks, which prevents the entrance of vessels into a harbour at low water. They are, for the most part, formed by the accumulation of earth, mud, and sand, washed away and brought down by the water of a river on its way to the sea. The rush of water, however, generally keeps clear one or two deep narrow channels in the mass for the entrance and exit of vessels; but in some cases, the entrances to rivers have to be kept open by the continual removal of the accumulating detritus by dredging-machines constructed for the purpose.

BAR, in Courts of Justice, is an inclosure or place in which counsel or barristers-at-law stand to plead causes in court. It is also applied to the benches where the advocates are seated; because, anciently, there was a har to separate pleaders from attorneys and others. Hence our lawyers who are called to the and others. Hence our lawyers who are caused to the bar are termed barrieters, an appellation equivalent to licentiates in other countries. (See Barrister.) It is also the place to which prisoners are brought to answer their indictments, &c.

Bar, in Law.—Pleas in bar, or peremptory pleas, are founded on some matter tending to impeach the right

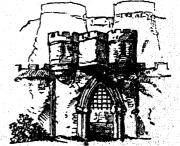

founded on some matter tending to impeach the right of action itself, and their effect, consequently, is to defeat the plaintiff's claim altogether. Pleas in bar are subject to various divisions. For, first, they comprise the class of general issues, which are denials (expressed in a particular form by ancient precedent) of the whole matter in the declaration, or, at least, of the pleas in bar are distinguished by the term of special rates. All these pleas are governed by particular pleas in our are distinguished by the term of special pleas. All these pleas are governed by particular rules of practice; as they involve much legal technicality and nicety, they are generally drawn by pleaders or barristers. In criminal pleading, a special plea to bar goes to the merits of the indictment, and gives a reason why the prisoner ought to be discharged from the presention. They are principally of four binds. reason way the prisoner ought to be discussed from the prosecution. They are principally of four kinds: a former acquittal; a former conviction; a former attainder; or a pardon. (See AUTREFOIS ACQUIT, AUTREFOIS CONVICT, ATTAINDER.)

Babaliffon, bār-ā-lip'-ton, a term employed by old logicians to denote the first indirect mode of the first

figure of syllogisms. A syllogism in baralipton is when the first two propositions thereof are universal affirmathe first two propositions thereof are universal affirmatives, and the third a particular affirmative, the middle term being the subject in the first and the predicate in the second proposition. For example: BA, Every evil ought to be feared. BA, Every violent passion is an evil. LIP, Therefore, something that ought to be feared is a violent passion.

Bars, barb, the name given to a fleet and vigorous breed of horses reared by the Moors of Barbary. They are usually nervous and long-winded, but, as a rule, are not remarkable for symmetrical beauty.

BARBACAN, bar'-b"-han (Fr. burbacane), a watch-tower placed before or over the outer gate of a castle-

#### Barbadoes Cherry

any important point of the surrounding walls. Also, an aperture made in the wall of a fortress to fire through upon an enemy. Also, a fort at the entrance of a bridge, or the outlet of a city, having a double wall with towers. The barbacan of the enatic was a point from which the drawbridge affording the principal way of egress and ingress across the surrounding most could be readily defended by the grand constantly kept there to prevent surprise or a night attack from hostile troops. The barbacan before Walmgate Bar, York, is a good specimen of this old style of fortifying the entrances to towns; and remains of this defensive on ontrances to towns; and remains or this detensive outwork, as applied to castles, may be seen in the ruins of those at Cauterbury and Franlingham, and, in a more perfect state, attached to the castles at Wagwick, Carlisie, Alawick, and Scarborough. The origin of the word is doubtful; but the Norman-French are considered to have derived its use from an Arabic word, and to have introduced it into England at the time of the Conquest

BARBADORS CHERRY. (See MALPIGHIA.)

BARBADOES GOOGEBERRY. (See PREPERITA.)
BARBADOES LAO, bur'-bai-does lik, a commercial name for the petroleum found in Barbadoes and several other of the West-India islands. (See Petroleum.)

BABBARA, bar-ba-ra, a term employed by logicians to denote the first mode of the first figure of syllogisms. A syllogism in barbara is one whereof all the propositions are universal and affirmative, the middle term being the subject in the first proposition, and attribute, or predicate, in the second; as, BAR, All beings who, on reflection, approve virtue, are beings conscious of obligation to act virtuously. BA, All men are beings who, on reflection, approve virtue. RA, Therefore, all men are beings conscious of obligation to act virtuously. BARBARA, bar'-ba-ra, a term employed by logicians

Therefore, all men are beings conscious of obligation to act virtuously.

BARBARIAN, bar-bair'-l-ān, is a term derived from the Greek, and was applied by that people to all that were not Greeks. The Greeks being at that time superior in civilization to their neighbours, the term implied a sense of inferiority. When the Romans first adopted the term, they applied it to themselves, but afterwards to all who were neither Greeks nor Romans. After the fall of the Waters marries in the service and in the service of the service and in the service of the service atterwards to all who were neither Greeks nor Romans. After the fall of the Western empire, it was applied to the Teutonic races, and subsequently to the Moors: hence the name Barbary, given to a district of North Africa. At present, the word is used in the sense of savage, rude, uncivilized.

BARBARISM, in Lit., consists in the employment of unusual or antiquated words or phrases, or the assigning to terms a different signification to that which usage has conferred upon them

has conferred upon them.

BABBARY APE, PIGMY APE, MAGOT, bar'-ba-re, in Zool., a species of ape. It is specially interesting, as its the only one now left in Europe. It is about the size of a large cat, and is greenish-grey in colour, paler underneath. It has no tail, and is sometimes called the tail lear matter. tail-less monkey. The muzzle is not so much elongated as in the baboons, and the facial angle is much higher than theirs. It has small, round, reddish, lively eyes, and its ears resemble those of a human being. The face is nearly naked, and somewhat wrinkled. It usually walks upon four feet; but it can be tamed and taught to walk. though clumsily, on two. They are found in to walk, though clumsily, on two. They are found in large numbers at Gibraltar, and inhabit the precipitous sides of the rock. They are gregatious, and live in parts of the rock inaccessible to man; but they are often seen in great numbers, the females carrying their young ones on their backs. They are very seldom their young ones on their backs. They are very seltom destroyed, on account of the amusement they afford by their gambols and tricks. The Barbary ape probably came to Gibraltar from the north of Africa, where it is very abundant, and inhabits rocky mountains. Bands of them will often plunder gardens, while one of the number keeps a keen look-out. This species of ape possesses a considerable amount of intelligence,

of ape possesses a considerable amount of intelligence, and is often seen tame in this country. They must, however, be taught when young, as they often grow sullen and vicious as they grow old.

BARBER (Barbus vulgaris), barb'-el, a fish frequenting the quiet and deep parts of rivers, and swimming with considerable strength and activity. It derives its name from the barbs or wattles attached about its name from the barbs or wattles attached a

#### Barbette

about ten pounds. large size. "So numerous are they about Shepperton and Walton, writes Mr. Yarrel, Mr. " that 150 lbs. weight have been taken in five hours; and on one occasion it is said that 280 lbs. weight

Barber, barb'er (Lat. barba, a beard), is one whose occupation it is to shave or trim'the beards of other people. The profession of barber, like many others, is an institution of civilized life, and is only known among those nations that have made a certain progress in civilization. We do not read of barbers at the state of the civil barbar and the state of the civilization. at Rome till about the year 451 of the city; but there, as elsewhere, when once introduced, they became men of great notoriety, and their shops were the resort of all the loungers and newsmongers in the city. Hence they are alluded to by Horace as most accurately in-formed in all the minute history both of families and

of large-sized barbel were taken in one day."

of the state. For the entertainment of waiting oustomers, newspapers being then unknown, the barber's shop was usually furnished with a lute or other musical shop was usually furnished with a lute or other musical instrument. But, in early times, the operations of the barber were not confined, as now, to shaving, hair-dressing, and the making of wigs, but included the dressing of wounds, blood-letting, and other surgical operations. (See next article.)

Barber-Chieurgeon, she-rur-jon, was, in former times, the designation under which the distinct and not very similar reconstitutions of harber and averages.

very similar occupations of barber and surgeon were carried on. In England, a company was formed under this name in 1308, and the London company was first incorporated by Edward IV., in 1461. Afterwards, a voluntary association was formed by certain persons, for the practice of surgery; but by 32 Henry VIII. c. 42, 1540, these two codies were united into one body c. 42, 1640, these two bounes were united into the body corporate, under the name of the Barbers and Sur-geons of London. This act, however, also separated the two crafts, declaring that "No person using any shaving or barbery in London shall occupy any surgery. letting of blood, or other matter, except only drawing of teeth;" and surgeous were strictly prohibited from of teeth;" and surgeons were strictly prohibited from exercising "the feat or craft of barbery or shaving." exercising "the feat or craft of barbery or shaving." Four gonethors or masters, two of them surgeons and two tarbers, were to be chosen, who were to see that the spirit of the act was observed. This company continued to exist till the incorporation was dissolved by 18 Geo. II. c. 15, and the barbers and surgeons of London formed into two distinct corporations. The barber-chirurgeon's sign, which is still retained, consisted of a striped pole, from which was suspended a basin; the fillet round the pole indicating the riband or bandage twisted round the carm previous to bloodletting, and the basin the vessel for receiving the letting, and the basin the vessel for receiving the blood. In Edinburgh, the barbers were united with oncor. In Endourgh, the partiers were unlike with the surgeons in one corporation, till about the year 1720, when, in consequence of some disputes about precedency, a process was commenced in the Court of Session, which ended in a total separation of the two Session, which ended in a total separation of the two bodies, the surgeons being found entitled to retain the charter and privileges of the incorporation. Eighty years ago, according to Mr. Creech, in his "Statistical Account of Edinburgh," barbers and perfumers were very numerous in that city, and had splendid shops in all the principal streets. Some of them advertised the keeping of bears to kill occasionally for greasing ladies and cantienems here and the progressor who and gentlemen's hair, and there was a professor who advertised a hair-dressing academy, and gave lectures "on that noble and useful art."

#### Barbican

over the creat of the parapet, instead of the more common mode, through the embrasures,

BARBICAN. (See BARBACAN.)

Barrios, bur'bi-tos, a stringed instrument resembling the lyre, but exceeding it in the number of its strings, the invention of which has been ascribed to

Earness, or Basins, bar-bals, a term employed in fairness to denote the tracts of superfluous flesh which grow up in the channels or intervals underneath the

tongue of a horse.

BARCAROLLE, bar'-ca-roal (Ital barcaruolo, a boat-man), certain songs composed by the Venetian gon-dollers, and sang by them in their boats. The style of these airs is simple and natural, like the manners of the people who produce them; and they posses a kind of artless beauty which not only strikes common sears, but delights even the cirtues. The Venetian gondoliers have the liberty of visiting all the theatres gratis, which gives them an opportunity of cultivating their ear and taste without expense. The gondolier songs are many of them so graceful and pleasing, that the musicians of Italy pride themselves on knowing and singing them.

BARCLAY AND PREKINS' BREWERY .- This establishment, which is situated in Park Street, Southwark, is one of the largest breweries in the world. It was originated by Henry Thrale, the friend of Dr. Johnson, in 1773, and was purchased by Messrs. Barclay and Perkins, at his death, for £135,000. At present, the establishment is of grantic proportions: more than 600,000 gallons of water and 2,600 quarters of malt are used weekly. The brewing-coppers will hold 120,000 gallons, and the fermenting-vessels will contain 1.500 barrels of beer. Two steam-engines, equal to 7.5-horse power, are employed to work the machinery; and in order to distribute the ale and porter amongst the retail sellers in London, more than 200 horses and

drays are employed.

Bab, bard (Celt. bard, a poet), a word of rather uncertain derivation, but most commonly applied to the professional poets among the Celtic natious. Tacitus (Germ. 3) tells us that the ancient Germans sought to infuse military ardour into their warrions by the songs of bards; and Strabo and Ammianus Mar-cellinus say that the songs and hymns of the bards were famous in their day among the Celtic peoples. They seem to have belonged originally to all the war-like nations of Western Europe; and it was only as civilization advanced that they were compelled to retire to the mountain retreats before the march of retire to the mountain retreats before the march of progress. Accordingly, we find them strongest in Wales and Ireland. Warton (in his History of 1984; 134 Pactry, vol. i. p. 37) tells us the British bards were criginally an appendage of the Druidical hierarchy; but it is pretty well established, that long after the Druids were extinct, the bards, who had attained a sort of eivil capacity, continued to flourish for a long period among the Celts. It is even related of Edward I., that the more thoroughly to aid his conquest by the sword, of the ancient Welsh, he gave orders to have all their bards destroyed, that, when the source of inspiration was cut off from them, their warriors might the more willingly succumb to English sway. By the laws more willingly succumb to English sway. By the laws of Hoel Dha, given about the year 940, among the Welsh, it was enacted that the court bard was to be a domestic officer of the prince, and to occupy the eighth place in his court. The bard was, besides, to hold his lands free. The prince was to allow him a horse and a woollen role, and the queen a linen gar-ment. When invested with office, he received from his prince a harp of rare workmanship, and from his queen a ring of gold, neither of which he was to part with on any account. He was to lodge with the prefect of the palace; and on the three annual festivals he had the privilege of sitting next this functionary, who was enjoined to deliver the harp into his hand. Any person who injured this royal bard had to pay a Any person who injured this royal bard had to pay a fine of six cows and 120 pence; and any one who murdered him had to pay 126 cows. These bards had enormous memories, were first-rate genealogists, and not unfrequently flattered the vanity of the courtiers to a great degree by their highly-coloured narratives of the public and private transactions of the nation to which they belonged. They were consequently revealed.

# Bargain and Sale

renced almost as much by the Welsh heroes as if they had possessed powers of divine inspiration. They were reformed and regulated by Gryffyth ap Conon, king of Wales, in 1078 a.b. Periodical eisteddicas, or sessions, of the bards, and their successors the ministrela, have continued in Wales down to our owntime. The Irish bardie history begins with the Milesian invasion. There were three classes of them in Irefand,—these who turned the tenets of religion into seven and those who turned the tenets of religion into verse, and who in battle raised the war-song; those who sat in the open air and chanted the laws of the nation; and the open air and chanted the laws of the nation; and those who sang history and the exploits of herces. Their profession was hereditary. Their songs are strongly marked by traces of Scaldic imagination, whigh they infused into the Welsh poetry when Gryflyth brought them over, early in the 41th contury, for the purpose of improving the Welsh songs. Agr. The works of Warton, Pennant, Walker, Jones, and Reauford.

BARDESANISTS, bar-de'-sa-nists, a sect of early heretics in the East, who took their name from Bardesanes, a native of Edessa, in Mesopotamia, who flourished about the year 170. They held that Christ was not born of a woman, but brought his body with him from heaven; that the devil was not created by God, but was a self-existent independent heing; and that there was no

resurrecti. i of the body.

BAREBONES PARLIAMENT, bair'-bones, a name given by way of represent to what is otherwise called the Little Parliament, summoned by Cromwell after the dismissal of the Long Parliament. It was so called after Mr. Praisegod Barbone, a "leather-merchant in siter Mr. Praisegod Barbone, a "leather-merchant or Fleet Street, and frequent in prayer," who was one of its members. It met on the 4th of July, 1653, and of the 140 members summoned to attend, only two did not come up. Very mistaken ideas long prevailed as to the character of this assembly. The members were said to have been chosen from the lowest, meanest, and most ignorant of the people,—the very dregs of fanatics. The works of Mr. T. Carlyle and others have served to put their character in a very different light.
"They were men got together by anxious consultation of the gody clergy and chief Paritan light in their respective counties, not without much earnest revision and solemn consideration in all kinds." They were, indeed, a body of most sincere and earnest men, only too eager in their efforts to accomplish a great national sod cager in reformation; and failed because they attempted too much, rousing a storm of hostility from all classes whose interests they turestened. The great business they set themselves to accomplish was "no less than introducing the Christian religion into real practice in the social affairs of this nation." "They had decided on abolishing titles; on supporting a Christian ministry by some other nethod than titles; nay, far worse, they had decided on abolishing the court of chancery." These questions not only raised storms without, but These questions not only raised storms without, but leat to dissensions and intrigue among themselves; so that they at last resigned their power into the hands of Cromwell, on the 12th of December, 1853, atternating as for five months and some odd days.—Ref. Cromsell's Letters and Speeches, by Thomas Cariyle.

BARE POLES, bair poles .- The term bare poles implies a ship lying-to, without any sail set whatever, in a gale of wind, renerally speaking, in consequence of being on a lee shore.

being on a lee shore.

BARGAIN AND SAIE, bar'-gain (Fr. barguigner), in the English law, is a contract whereby the bargainer, for consideration, actually, or by the deed admitted to have been paid, bargains and sells,—that is, contracts to convey the land to the bargainee, and becomes by such bargain a trustee for, or seized to file use of, the bargainee; and the Statute of Uses compistes the purchase, or, as it has been averaged the bargain trustees. chase, or, as it has been expressed, the bargain first vests the use, and then the statute vests the possession. But, as it was foreseen that conveyances thus made would want all those benefits of notoristy which the old common law assurances were calculated to give, to prevent clandestine conveyances of freeholds, it was enacted by statute 27 Hen. VIII. c. 16, that such bargains and sales should not enure (be available) to pass a freshold, unless made by indenture, and enrolled within six months in one of the courts of Westminster Hall, or with the custos rotulorum or clerk of the peace of the county. Clandestine bargains and sales

of chattel interests, or leases for years, were thought not worth regarding, as such interests were very precarious till about six years before, which also consisted them to be overlooked in framing the Statute of Uses; and therefore such bargains and sales are not directed to be enrolled. This omission gave rise to the species of conveyance by lease and selesse. Before the adoption of this last mode of assurance, the usual method of transferring freehold estates was by a deed of feoffment, which was executed on the land: and nieraod of transferring freehold eastes was by a deed of feoffment, which was executed on the land; and corporeal possession was given by the feoffer delivering to the feoffee a clod of earth, in the name of the whole estate, which was called livery of seizin. This was done in the presence of several witnesses, who attested the in the presence of several witnesses, who attested the fact by signing their names under a memorandm indersed on the deed. To obviate this, the plan of lease and release was invented. A lease was granted, or a bargain and sale made, by the transferrer to the transferree for one year, by which he became invested with the possession, and by the release the property was conveyed to certain uses thereby declared. But now a release of freehold estate is declared to have the same offers as lease and release by the two varieties. same effect as a lease and release by the same parties; and therefore the deed of bargain and sale, so far as and therefore the deed of bargain and sale, so far as uddeets freeholds, has become obsolete. Bargain and sale of copyhold estates is still a mode adopted to enable a purchaser to take admission without a currender, when a testator merely directs a sale of his estate to be made, instead of devising it to his trustees upon trust to sell. The trustees can in such case execute a bargain and sale without being admitted and extended to the number of a similar slock and surrendering to the purchaser. A similar plan is adopted in the case of bankrupts' copyhold estates, the bargain and sale being executed by the commissioner to the purchaser. A bargain and sale, or an assignment of chattels personal, may in general be by parol,—that is, either by mere writing or by word of mouth, and does not require the solemnity of a deed, for the extual deligency of possession. But instruments nor the actual delivery of possession. But instruments in writing are frequent, and in some cases essential, and are either in the form of a note or memorandum, or of a regular assignment or bill of sale. In the case of goods sent from abroad, the transfer is effected by a bill of lading, which is in its form a receipt from the captain of the vessel to the shipper, undertaking to deliver the goods (on payment of freight) to some person whose name is therein expressed, or indersed thereon, by the shipper; and the delivery of this instrument (independently of the actual delivery of the goods) will suffice to pass the property in them to the party so named, or to any other person to whom he may think fit to indorse it over. A contract in writing is necessary to make binding a contract for the sale of goods to the value of £10 or unwards, where no payment or delivers in additions in the sale. the value of £10 or upwards, where no payment or delivery is made under it, or carnost given. It is also necessary, on the grant and assignment of life annuities, the transfer of ships, and the assignment of a copyright or patent right; and a bill of exchange, promissory note, or cheque, or draft on a banker, when payable to the order of a particular person, can be assigned by him only under a written indorsement of his game. his name.

Barcz, barje (Du. bargie), a boat of state or pleasure, with elegant apartments, canopies, and cushions, cquipped with a band of rowers, and adorned with flags and streamers, generally used for processions on the water by officers of state, magistrates of great cities, &c. There are also barges of a smaller kind, cities, &c. There are also barges of a smaller kind, for the use of a limitals and oaptains of men-of-war. These are of a lighter frame, and may be easily hoisted into and out of the slips to which they belong. (See Itoar.) It is also the name of a flat-bottomed vises of burden, used on rivers for conveying goods from one place to another, fer loading and unloading a hips, and has various names; as a West-country barge, a sand-burge, a row-barge, &c.

Barge-Board (Ger. bergs-board).—In Goth. Arch., the slate or tile projection over the gables of a building is called the barge-course; and, by way of ornament, or

the state or tile projection over the gables of a building is called the barge-course; and, by way of ornament, or to protect the plaster, which is applied under the barge-course between the roofing and the wall, from injury from the weather, Boards, sometimes richly carved and ornamented, technically called barge-boards, are fastened to the ends of the rafters that lie on the gable end. Good specimens of these decorative 207

boards may be seen in Coventry, Oxford, and many old English towns. The terms barge-board and bargecourse eeem to be a corruption of parge-board and parge-course, taking their names from the parget or plaster of the latter.

plaster of the latter.

Baritus, ba-ril'-lit (Sp.).—The commercial name applied to the impure sods-ash procured by calcining various species of Salsola, Salicornia, Chempodium, and Atriplex. The plants grow near the ses, in salt marshes, and are extensively cultivated in Spain, Sicily, and the Canary Islands. The seed is sown at the end of the year, and the plants are gathered towards the end of autumn, dried, and burned. Barilla is a grey semi-lused mass of ashes, and contains about 30 per cent. of carbonate of sods. The importation of barilla into Great Britain was for merly very large, but has been reduced to nothing of merly very large, but has been reduced to nothing of late years, by the various improved methods of manufacturing sods from common salt. (See Sona.)

BARTONE. (See BARTONE.)
BARTONE, bair-i-um (atomic weight 68.5, symbol
Ba), in Chem., the metallic base of the alkaline earth
baryta. This metal was discovered by Davy in 1809, and was named brium, from the Greek word burus, heavy, on account of the excessive density of its compounds. It may be formed, by voltake decomposition, pounds. It may be formed, by volute decomposition, from the anhydrous chloride, or by passing the vapour of potassium over red-hot baryta contained in an iron tube, a mixture of oxide of potassium and barium is formed, which is amalgamated with mercury. On distilling off the mercury in an atmosphere of hydrogen, the metal barium is left behind in a somewhat impure the metal burum is left behind in a somewhat impure state. Owing to the difficulty with which it is prepared, little is known of its properties. Its specific gravity is said to be 4. It is a white, slightly malleable metal, decomposing water at ordinary temperatures. It quickly tarnishes in the air, from the absorption of oxygen. When moderately heated, it burns with a deep-red fiame. It forms two oxides,—the protoxide acid, BaO, and the peroxide, BaO<sub>2</sub>: the former only forms sait. forms salt.

forms sait.

Barum, Chlorid of, in Chem., unde by dissolving carbonate of baryta in hydrochloric acid, evaporating and crystallizing. It is a colourless sait, crystallizing in flat four-sided tables, and dissolving in three parts of cold and two parts of hot water. Its solution forms the usual test for sulphuric acid, which it indicates by forming a white precipitate insoluble in nitrie acid.

Darming a white precipitate insolution in intro socia.

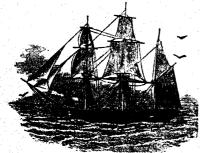

Rabium, Penoxube or—The peroxide or binoxide of barium is much used in chemistry, it being prone to give up its second equivalent of oxygen to exthem efficiently, boron, and netals, at a red heat. Hence its use in forming rare peroxides of certain metals. It is formed by passing oxygen over anhydrous baryts at a red heat, or by heating to reduces a mixture of fermil parts of children of formula parts. of equal parts of chlorate of potass and pure baryta.
The chloride of potassium is washed out, and the hydrated binoxide remains behind in the form of a white powder. It has been proposed by Boussingault white powder. It has been proposed by Boussingault to prepare oxygen cheaply by passing a current of atmospheric air over heated baryta. The binoxide of barium formed is heated, and parts with the oxygen absorbed, leaving baryts behind, which is again submitted to the oxidizing process just mentioned. These processes are repeated ad infinium, always using the same portion of baryts. The method does not, however, appear to have been made commercially available.

Bark, bark (Dan.) in Bot. the external coating of

same portion to taryts. The metabol does not, nowever, appear to have been made commercially available.

BABK, bark (Dan.), in Bot., the external coating of
an exogenous or discovitedonous stem and its branches.
It is distinguished from the rind or false bark of an
endogenous or of an acrogenous stem, by its mode of
growth, and by the ease will which it may be separated
from the wood beneath. The bark presents three distinct layers, independently of the epidermis which is
common to it, with other external parts of the plant.
These three layers, proceeding from within outwards,
are known as the liber, or inner bark; the cellular envelope, or greenlayer; and the suberous, or corkylayer. Some
botanists apply to these three layers, respectively, the
Grock terms, endophiloum, mesophiloum, and epiphiloum.
The bark is connected organically with the wood by
means of the medullary rays and cambium-layer. (See
SYEM.) It develops in an opposite direction to that
of the wood; for while the latter increases by additions
to the outer surface, the bark increases by additions

to the inner. Each layer of the back grows separately; the two outer layers, constituting the cellular system of the bark, rarely continue to grow after a few years, but become dead structures on the surface of the tree. The inner back, however, continues to grow throughout the life of the individual, by the addition of annual layers on its inner surface from the cambium-layer of layers on its inner surface from the sambium-layer of the wood. In some trees, the oak for example, up to a certain age, these fiber layers may be readily observed. (See Lines.) The outer layers of the bark, from the dis-tension to which they are exposed by the growth of the wood beneath, generally become cracked, in various directions, and give a rugged look to the trunk, as in the sim and cork-oak. In some trees, however, as the basch, the hark always remains smooth, owing partly besch, the bark always remains smooth, owing partly to the small development of cellular layers, and partly to the great distensibility of the layers. There are several kinds of bark which enter largely into commerce, being used for processes in the arts, or for medicines. e will be found noticed in separate articles, under These will be found noticed in separate articles, under the botanical names of the genera which include the plants producing them. For oak-bark, quercitron-bark, and cork (see Quencus); Peruvian bark (Cin-chona); cabbage-bark, Surinam bark (Andira); cas-carilla bark (Ckoton); wild-cherry bark (Crasus), Bark (Irish, bare; Fr. barque), a general name given to small ships. It is, however, peculiarly appro-priated by seamen to those which carry three masts without a mizen-topsail. It is also used by mariners

trained in the coal-trade to indicate a broad-sterned ship without a figure-head. A long-bark free small vessel without a deck, and longer and lower than the common bark. It is built after the model of a sloop,

common bark. It is built after the model of a sloop, and is in many places called a double sloop.

BARKER'S MILL. (See TURRINE.)

BARKING-BIRD, bar'-king (Pteroptochos).—A native of the South-American srchipelago, building its nest close to the ground, among the underwood and faller branches. Says Mr. Darwin, "Its name is well applied! I defy any one, at first, to feel certain that a small dog is not yelping somewhere in the forest. Just as with the cheucan, a person will sometimes hear the bark close by; but in vain may endeavour, by watching, and with still less chance by beating the bushes, to see its anthor; yet at other times the "guid-guid' comes fearlessly near."

BARKS, WATER, small vessels used in Holland for

BARES, WATER, small vessels used in Holland for the carriage of fresh water, and for fetching sea-water to make salts of, with a deck, up to which they are

filled with water.

Bars Srovs, in Gardening, a pit built of brick in a hothouse or house of glass, filled with refuse bark from a tanyard, in which potted plants are plunged which require bottom-hent, or heat round the roots, and a moist amosphere. The hest and moisture are pro-duced by the fermentation of the bark. These bark-beds or stoves are used for the culture of all tropical bets or stoves are used for the culture of all tropical plants, such as pines, palms, &c., and for striking cuttings of all sorts. They are principally valuable for the regular bottom-heat they supply, which varies from 60° to 70° Fahrenheit, as soon as the fierce heat produced in the early stages of fermentation has sub-aided.

BARLAIM AND JOSAPHAT, har lam, jos'-a-fat, is the

name of one of the most widely-spread religious romances of the Middle Ages, which relates the convertion of an Indian prince, Josephat, by the herrnit Barlasm, It was written originally in Greek, not by John Damascene, as some have supposed, but by an Rastern, probably an Ethiopian, Christian. A German-translation of the original was published by Liebrecht (Münster, 1847). From a Latin version which was extensively circulated in the Middle Ages, were made three verse and several proper translations in Franch. From circulated in the Middle Ages, were made three verse and several prose translations in French. From a Provençal original in the beginning of the 14th century sprang the Italian "Storia di S. Barlaam;" and in Germany, Rudolf von Ems took his poem "Barlaam and Josaphat" from the Latin version. It was also translated into Spanish by Juan de Arze Sclorsane; into Bohemian and Polish; and into Norwegian ("Barlaams och Josaphats Saga"), by King Hakon bverresson (Christians, 1852). It has evén been translated into the Talaga Isanguage of the Philippines, and there printed (Manilla, 1712).

Manila, 1712).

Barley. (See Hordrem.)

Barley-Berry, bar-le-breek, the name of a popular pastime very common in the time of James I., and pastine very common in the time of James 1., and which is frequently referred to by older writers. It was played by six persons, three of each sex, who were formed into couples. A piece of ground was then divided into three parts, the centre one being called hell. One of the couples was stationed in this hell, hell. One of the couples was stationed in this hell, and their effort was to catch either of the other couples and their effort was to catch either when the in crossing from the one side to the other, when the couple caught had to take up their place in the centre. The couple in the centre were bound to keep together; but the others, when hard pressed, might sever. out the others, when hard pressed, might sever. When all had been taken, the game was ended; and the last couple taken was said to be in hell, their punishment appearing to have consisted in kissing each other. Games of a similar kind, more or less modified, are still practised by young persons both in England and Scotland.

BARM. (See YEAST.)

BARMECIDES, or BARMERIDES, i. e. children of Barmek, bar'-me-sides, is the name of a celebrated Persian family, amongst the wealthiest and most powerful in isminy, amongst the weatmest and most powerful in the province of Khorasan, which played an important part in history under the earlier of the Abbaside califs. Kaled-ben-Barmek, son of Barmek, the first of whom we have any authentic accounts, was the prime minister of Abul Abbas Saffah, the first Abbaside calif, and his influence did not diminish during the reigns of Al-Mansur and El Mahdi, the latter of whom intrusted him with the education of his son, afterwards so cele-beded ander the name of Harun Al Raschid. Yshis, the son of Kued, according to Eastern historians, was possessed of the most distinguished virtues, and ren-dered the most eminent services to the calif Harun, who, upon his accession, in 786 A.D., nominated him his vizier. Equally versed in civil matters and in all his vizior. Equally versed in civil matters and in an that pertained to the art of war, he contributed greatly to the prosperity of the reign of Harun Al Raschid. Yahia had several sons, of whom the best known are Fadhl and Djafar (the Giafur of the Arabian Nights), both of whom partook of the fortune and favours of their father. Fadhl had the administration of justice, their father. Fadhl had the administration of justice, and to Djafar was confided the superintendence of the palace of the calif and the education of his son, Al Mamun. After a period of unequalled prosperity, this family was (in 803) stripped of all its power and wealth, and treated in the most cruel manner by the very calif who was so much indebted to it. Djafar was put to death at the age of S7; Yahia and his son Fadhl were both imprisoned in a remote part of the country; and all the relatives or friends of the Barmardies were in all the relatives or friends of the Barmerides were involved in the same disgrace, some being massacred, others imprisoned and deprived of their goods. The causes assigned for the audden and terrible reverse of fortune are very various. According to some, Harmwas jealous of the power and influence of the Barmerides; according to others, Djafar had disobeyed the calif's orders in setting at liberty Prince Alide, whom he had commanded to be put to death; while, according to others, Djafar had married or seduced a sister of the prince, the beautiful Rhassa. The misfortunes of the Barmerides have afforded the Oriental poets materials for numerous songs, sad have also formed the subject of several tragedies; among others, that of La all the relatives or friends of the Barmerides were in-

### Barnabas

Harpe, entitled, "The Barmecides," which appeared in 1778. An able and learned article on the Barmecides is to be found in the German Encyclopedia of Ersch

Barnahas, THE EPISTLE OF St., bar-ad-bis, an apocryphel work ascribed to Barnabas, the companion and fellow-labourer of St. Paul. This epistle lays greater claim to canonical authority than most of the other apoeryphal writings. It is cited by Clemens Alexandrinus, Origen, Eusebius, and Jerome, who ad-mit it to be the work of Barnabas, but declare that it ought not to be esteemed of the same authority as the canonical works. It is published by Archbishop Wake among his translations of the works of the Apostolical among his translations of the works of the Apostolical Fathers, in the preliminary dissertation to which he gives the arguments adduced to prove it to be the work of St. Barnabas. It is, however, generally be-lieved to have been written by some converted Jew in the 2nd century, and seems to have been addressed to the unconverted Jews. It is divided into two parts. In the first part, the writer shows the unprofitableness of the old has and the accessive of the inversation and of the old law, and the necessity of the incarnation and death of Christ. He cites and explains allegorically certain passages relating to the ceremonies and precepts of the law of Moses, applying them to Christ and his law. The second part is a moral instruction, under the notion of two ways,—the way of light, under which is given a summary of what a Christian is to do that he is given a summary of what a Christan is to do that he may be happy for ever; and the way of darkness, with the different kinds of persons who shall be for ever east out of the kingdom of God.

BARNABAS, GOSPEL OF ST., an apocryphal work ascribed to Barnabas. It relates the history of Christ very differently from the Evangelists, and is believed

to be a forgery of some nominal Christian, and after wards altered and interpolated by the Mohammedans, the better to serve their purpose. It corresponds with those traditions which Mahommed followed in the Koran.

BARNABAS DAY, St., a Christian festival, celebrated

on the 11th of June.

BARKANTER, bar's ü-bites, the name of a religious order founded in the 16th century by three Italian noblemen of Milan, who had been advised by a famous preacher of those days to read carefully the epistles of St. Paul; and hence they were also called Clerks of the order of St. Paul. They took the name of Barnabites from having performed their first exercise in the church of St. Barnabas, at Milan. They were confirmed by Pope Clement VII. in 1533. The order dress in black, like the scular clergy, and devote themselves to mis-sions, preaching, and the instruction of youth. It only

exists at present in some parts of Italy.

Barnacle, bar nu-kel (Port. bernacu), a marine animal, which attaches itself to ships bottoms and other mal, which attaches itself to ships bottoms and other submarine substances. To such an extent will these little creatures adhere to the sides and bottoms of floating vessels, as to impede their progress and render necessary their docking and cleansing.

Banacle Goose. (See Brencle Geess.)

Banoco, 6a-ro'-ko, in Log., is a name given to the fourth of the second figure of syllogisms. A syllogism in harmon has the first propositive universal and affirm.

in baroco has the first proposition universal and affirm-ative; but the second and third particular and negative, the middle term being the predicate in the first two propositions; as, BA, Every man is a biped. RO, Every animal is not a biped. CO, Therefore, every animal is not a man.

BAROLITE, bar'-o-lite (Gr. barus, heavy, lithos, stone) carbonate of baryta, or witherite. It contains 80 parts of barytes and 20 of carbonic soid. It is found at Alston Moor, in Cumberland, and at Anglesack, in Lancashire. It is much used in the North for poison-

ing rate.

ing rats.

BAROMETER, bd-rom'-e-ter (Gr. baros, weight, metron, a measure), an instrument for measuring the weight or pressure of the atmosphere. It may be said to be the invention of Torricelli, who first demonstrated the existence of the atmospheric pressure by means of a column of mercury contained in a glass tube. The story of the invention cannot be too often re-told, as it illustrates in a most attribing meaner the triumph of

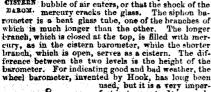

## Barometer

water on the withdrawal of the air was accounted for by the ancient dictum "Nature abhors a vacuum which was universally accepted as a great truth. which was universally accepted as a great truth. By thus personifying Nature, and connecting phenomens with her likes and dislikes, the progress of true science was greatly impeded; for by habit men got to attach as much importance to some meaningless phrases as to actual facts. To question Nature's schorrence of a vacuum was a kind of scepticism, which must have appeared to the contemporaries of Torricelli almost as reproducible as religious doubt. The access of an reprehensible as religious doubt. The sages of au-tiquity had declared that a vacuum was repugnant to Nature, and any one who ventured to dispute this point was clearly guilty of an attempt to subsert the noble and perfect system of philosophy taught by those sages. The first observation which led Torricelli to ask Nature experimentally why she abhorred a vacuum, was said to have been made by some pump-makers of Florence, who found that water would not rise higher than thirty. two feet, or thereabouts, when the air was exhausted. They applied to Galileo, who was regarded as a cunning man in mechanics, for a solution of this problem, and he, not having got rid of the old metaphysical con-ception of Nature, gave them the simple answer, that the power of Nature to contend against a vacuum ceased when she had destroyed one thirty-two feet high. It is not unlikely that this answer of Gailleo was ironical, for it is certain that he afterwards rejected the theory of Nature's horror altogether, though without substi out the problem, and to him the happy idea occurred, that the weight of the atmosphere might be the counterpoise to the thirty-two feet of water in the pump. He determined to test this hypothesis by experiment, and hit on the beautiful expedient of employing mercury, or quicksilver to counterpoise the weight of the air. It is not difficult to trace the line of reasoning which led to the adoption of mercury. He saw that, provided it was the weight of air which balanced the column of was the weight of air which balanced the column of mater, it would necessarily suctain a much shorter column of mercury; in fact, that the height of the column would be reduced in the proportion in which the liquid metal is heavier than water. Thus, mercury being about fourteen times heavier than water, bulk for bulk, the fourteenth part of thirty-two feet, or about two feet four inches would supply the place and about two feet four inches, would supply the place, and produce the effect of the water. Torricelli's experiment produce the cuest of the water. Torricell'a experiment was conclusive, and the notion that water rises in a pump through Nature's abhorrence of a vacuum ceased to retard the progress of discovery. The experiment is thus performed: a glass tube about a yard long and a quaster of an inch internal diameter, is sealed at one a quarter of an inch internal diameter, is sealed at one fad, and completely filled with insercury. The aperture being closed by the thumb, the tube is inverted, the open end placed in a vessel containing mercury, and the thumb removed. The tube being in a vertical position, the column of mercury sinks, and after oscillating some time, it finally comes to rest at a height which, at the level of the sea, is about thirty inches above the mercury in the vessel. The weight of the column of mercury in the tube is supported by the column of mercury in the tube is supported by the pressure of the atmosphere on the mercury in the open vessel. There is no contrary pressure on the mercury thus supported, because the upper end of the tube is closed; but if it be opened, the atmosphere will pressequally inside and outside the tube, and the mercury will at once sink to the level of that in the vessel. (See ATMOSPHERE ) Torricelli died shortly after having thus ATMOSPHERE. Torrices need society sheer thank thus devised a simple means of weighing the atmosphere. He left this discovery incomplete; for though he had antifactorily proved that the weight of the water in the pump and that of the mercury in the tube each formed a counterpoise to something, he had not confirmed his correct surmise that this something was the pressure of the atmosphere. To Pascal the world is indebted for this confirmation; he first proposed that Torricell's experiments should be made at different heights above the sea-level, to see whether the column of mercury would indicate, by falling or rising, any decrease or increase of pressure. Experiments made by his request at the base and on the summit of Puy-de-Dôme, in story of the invention cannot be too often re-told, as it is the buse and on the summit of ray-de-bone, in illustrates in a most striking manner the triumph of Anvergne, proved beyond a doubt that it was really inductive philosophy over deep-rooted error. Up to the weight of the atmosphere which supported the tage of Torricelli no one thought of investigating the phenomena of a common pump. The rising of the was three inches lower than that observed in the valley.

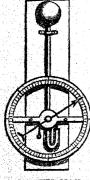

#### Barometer

The straight glass tube inverted into a vessel of mer-cury, as in the experiment of the Florentiue philo-sopher, may be regarded as the simplest form of the mercurial barometer. To render this in-

strument more postable, the eistern con-taining the moreury, into which the open end of the tube dips, is covered in, the external air being only admitted through a very small bole. The tube is usually fixed very small none. Lie tube in usually have in a mallogary frame, on the upper part of which there is a scale graduated in inches from the level of the mercury in the cisten; a movable inder shows on the scale the level of the mercury. A thermometer is generally attached to the same frame; the annexed figure shows such an arrangement. There is one serious fault in a barometer of this kind: the fixed scale does not always indi-cate the true height of the column above the surface of the mercury in the cistern, for this surface necessarily rises as the column sinks. If the diameter of the cistern is large relatively to that of the tube, the error from this source is lessened. In Fortin's barometer the base of the cistern is made of leather, and can be raised or lowered by means of a screw. This contrivance enables the observer to obtain a constant level, and it greatly increases the portability of the instrument. In travelling, it is only neces-sary to raise the leather till the mercury, which rises with it, completely fills the cistern; the barometer may then be inclined, or even inverted, without any fear that a bubble of air cuters, or that the shock of the

fect instrument. It is merely a siphon barometer councet ed with a needle, which moves round a graduated circle. The annexed figure shows the instrument before the mercury is introduced. In the specter leg of the siphon a float placed, which rises and falls with the mercury. A string attached to this float passes round a pulley, to which the needle is fixed, and at the other end there is a small weight, somewhat lighter than the float. When the pressure varies, the float sinks or rises and moves the needle round to the corresponding points on the scale. The barometers in domestic use, which are called weather-glasses, are of

wratere-Glass. this kind. The words rois, fine, variable, &c., generally appear on the graduated circle; but they do not afford any reliable indications of the weather. Change of weather frequently coincides with change of pressure; and experience has proved that the barometer may be used as a weather-indicator, but cannot always be depended on. As a rule, a falling barometer prognosticates rain; a rising barometer, fair weather. When the column of mercury is unsteady, it indicates an unsettled condition of the atmosphere; a steady baro-meter indicates that the weather at the time will last. If the mercury be low, the weather will remain bad; if the mercury be high, the weather will continue fair. A sudden falling of the barometer almost invariably presages a storm. The connection between the variations of the weather and the pressure of the atmosphere is, however, a subject very ill understood. For deter-210

#### Baron

mining altitudes, the barometer is an invaluable instru ment. In ascending mountains, the mercury is found to sink about a tenth of an inch in 90 feet; so that, if the mercury fall an inch, we have ascended near 900 feet; but this is subject to variations from change of temperature and other causes, which render vario corrections necessary. The most important barometric measurements of late years are those which have been measurements of late years are those which nave been made by Professor Guyot on the Appalachian mountains, and which have greatly advanced physical geography. There are many forms of the mercurial barometer, but they are all modifications of the siphon or the cistern. The instruments for measuring the pressure of the atmosphere without employing higuids are described under the head of AMEROID BAROMETER.

describes under the head of AREROID HAROMETER.

BAROMEZ. (See CINDTURN.)

BAROME, bin' on (Fr. baron; Ital. barone), at title denoting the lowest rank in the peerage, the degree of nobility next below that of viscount. The etymology of the word is very doubtful, but it is probably derived from the Latin word baro, which at first signified a dull, stupid fellow, and afterwards by some transmittation, come to afterwards, by some strange transmutation, came to denote a person of distinction. Originally, the name baron was applied in England to all the nobility, of whatever rank; because all noblemen were barons, even although they occupied a higher rank in the peerage. But it has sometimes happened, that when an ancient baron has been raised to a new degree of peorage, in the course of a few generations the two titles have descended differently; one, perhaps, to the maie descendants, the other to the heirs general, whereby the earldom or other superior title has subsisted without a barony; and there are also modern instances where earls and viscounts have been created without amezing a barony to their honours; so that now the rule does not hold universally, that all peers are barons. The origin and antiquity of barons have occasioned great inquiries among English antiquaries. The most probable opinion seems to be that they were the tenants probable opinion seems to be that they were the tenants in chief of the crown, persons who held lands of the crown by military or other services, and who were bound to personal attendance in the king's court when he should please to summon them, to do homage to him, and to assist in the administration of justice and in the transaction of other business that was done in the court of the king. Thus, originally, all lords of manors, or barons that held of the king in capite, had seats in the great council or parliament In the reign of King John, however, the conflux of them became so great and troublesome, that the king was obliged to divide them, and summon in person only the greater parons, leaving the smaller ones to be summoned by the sheriff, and, as it is said, to sit by representation in another house, which gave rise to the separation of the two houses of parliament. By degrees, the title came to be confined to the greater barons, or lords of parliament only, and as these were summoned by writ, the production of that writ constituted their right to sit and vote. Hence, actual proof of a barony by tenure became no longer necessary to constitute a lord of par-liament; but the record of the writ of summons to him or his ancestors was admitted as a sufficient evidence or in sneestors was admitted as a subject to vidence of the tenure; and hence, too, the acquisition of territory no longer, as originally, ennobled its possessor. Another class of barous—barons by patent—was constituted by Richard II. (the first being Beauchamp, of Kidderminster), who received it as a title of honour, irrespective of the tenure of lands. In barons by writ, the dignity descends to heirs general; in barons by patent, it goes according to the teneur of the patent.
When a person, who was a baron by tenure, received the king's writ to repair to the parliament, the receipt of the writ, and obedience to it, created in him a dignity as a lord of parliament, which adhered to him during his life, and was transmitted to his heir. Some, however, are of opinion that there must be at least two writs of summons, and a sitting in two distinct par-liaments, to evidence an hereditary berony; but there have at least been many adjudications of claims to dig-nities made in accordance with the former view. The mere writ, however, does not ennoble a man unless he has actually taken his seat in the House of Lords. In consequence of the inconvenience thus attending it.

creation by letters patent is now usually adopted, ex-

cept in the case of the eldest son of a peer, there being here no danger of the children losing their nobility, even should their father never take his seat. Creation by letters patent is perfect and complete as soon as the great seal is sffixed; but it labours under this disadvantage, that the course of descent by which it is intended that the dignity should pass must be specifically laid down in the patent, otherwise it ceases with the life of the grantee. It has recently been decided, in the case of Lord Wensleydale, that a patent, expressly granting the dignity only for life, does not entile the holder to a seat in the House of Lords. When a baron is summoned to the House of Peers by writ of summons, the writ is in the name of the sovereign, who enjoins him to come to the parliament appointed to be held at a certain time and place, and there to advise with his sovereign, the prelates and nobles, about the weighty affairs of the nation. The ceremony of his admission into the House of Lords is thus: He is brought into the house between two peers of his own rank, who conduct him up to the lord chancellor, his rank, who contact him up to the ford chancehor, inspatent, or writ of summons, being carried by Garter king-at arms, who presents it to his lordship. The lord chancellor directs the same to be read, which, being done, the oaths are administered, and the peer takes his seat, from which he again rises, and returns to the changellor, who congretables him on heconing. the chancellor, who congratulates him on becoming a member of the House of Peers. The coronation robes of a baron differ from those of the other peers in having or a paron diner from those of the other peers in maxing but two rows of spots on the mantle, and the par-liamentary robes in having but two guards of white fur, with rows of gold lace. The right of wearing a coronet was first conferred on barons by Charles II. It is was not content of mators by Charles 1. It is adorned with six pearls, set at equal distances, of which four are usually shown. Barons are styled "right honourable," and addressed officially by the Crown as "right trusty and well-beloved." Their children enjoy the prefix of "honourable."

Baronage, bir -o-ndj, a collective noun, signifying the whole body of the barons; but used also in wider sense to comprise the whole of the poblitive

a wider sense, to comprise the whole of the nobility, without regard to the distinction of dukes, marquises, earls, viscoauts, and barons. It is used in this latter sense by Sir William Dugdale, in his able and learned work, "The Baronage of England" (1875-6); for an account of which see the English Encyclopadia—Arts

and Sciences.

BARON AND FEME (old Fr.), terms used in the old law books for husband and wife. (See Husband.)

BARON COURT. (See COURT BARON.)
BARON TO THE BARON, BARON THE BARON THE BARON.
BARONTT, bar'o-net, an English title of dignity, which properly signifies a little baron. It has been said, in the article BARON, that, in the reign of said, by the baron the greater with the learn the baron that the baron the greater with the learn the baron that the baron the greater with the learn the greater with the learn the baron the greater with the learn the greater with the learn the greater with the learn the greater with th and the lesser, the former of whom only were sum-moned in person to parliament. To the latter, or moned in person to parliament. To the latter, or lesser barons, we find the title of baronet frequently given; but it was not until the reign of James I. that the dignity was formed to which the title of baronet the dignty was formed to which the controlled in any plied. This monarch, being in want of money, hit upon the expedient of creating this new dignity, in 1911, and offered it to 200 gentlemen of good birth, possessing a clear estate of £1,000 a year, upon condition that each should pay into the royal exchequer, in three count instalments, a sum equivalent to three possessing a clear estate of £1,000 a year, upon condition that each should pay into the royal exchequer, in three equal instalments, a sum equivalent to three years' pay of thirty soldiers, at £d. a man per day, or about £1,035, the first instalment to be paid on delivery of the patent. The money was professedly for the purpose of settling and improving the province of Ulster, in Ireland, which had become vested in the crown by the attainder of its previous owners; and hence these baronets had the right of adding to their family arms those of that province, familiarly known as "the bloody hand." It was stipulated, on the part of the king, that the number of baronets should never exceed 200, and that, as the number was diminished by the extinction of families, or otherwise, no new creations should be made to supply their places. This stipulation has long been disregarded, and new baronets are created every year. It was also stipulated that ne hereditary dignity should ever be created to intervene between baronets and the peerage. Payment of money will no longer obtain the title; but the ancient form of the patent is still retained, as when money was given for it; and it is always accompanied

by a discharge from the Exchequer, as if the stipulated sum had actually been paid in. Baronets are entitled to the prefix of Sir, and the affix of Baronet; and their wives are styled Lady, Madam, or Dame, according to usage. The rank of baronet is the last of the hereditary usage. An exam of Datones is the last of the interest and titles; but a baronet has no robes, oxonote, or distinctive badge whatever, except in the case of Scottish baronets, who, in 1829, were granted the privilege of wearing an orange riband and badge. In 1819 the wearing an orange riband and badge. In 1619 the diguity of baronet was created in Ireland, upon the same terms as in England; and shortly before the death of Ling James, the plantation of the province of Nova Scotia, in North America, was assigned as a cause for extending the same offers to Scotland. The king didnot live to fulfil his intention; but Charles I., acoustier his accession, created the first baron of Nova Scotia. From the Union, in 1708, baronets created in England or Scotland heaven harveste of Great Britain. England or Scotland became baronets of Great Britain; and those created since 1800 are baronets of the United Kingdom. The only instance of a baronetcy being conferred upon a female occurs in the case of Dame Mary Bolles, of Ashurton, who, in 1635, received that dignity, with remainder to her heirs whatsoever.

Barons of the Cinque Ports were, previous to the passing of the Reform Bill, members of the House of Commons, elected by the five ports, two for each port. Formerly, the principal citizens of London were honoured with the title of baron, as were also the

mayors of Corfe Castle, in Devonshire.

BARONS OF THE EXCHEQUEE are the judges of the court of Exchequer, five in number, consisting of one chief and four puisne barons. Selden (Tit. of Hon., 2, 5, 16) conjectures that they were anciently made out of such as were barons of the kingdom, or parita-mentary burons, and thence to have derived their name; which conjecture receives great strength from Bracton's explanation of Magna Charta, c. 14, which Bracton's explanation of Magna Charta, c. 14, which directs that the earls and barons be americed by their peers; that is, says he, by the barons of the Exchequer,—Ref. Bract. 1. 3, tr. 2, c. 1, s. 3.

Barony, būr'-o-ne (Lat. baronia, or baronagium), is that honour and territory which gives title to a baron; comprehending not only the fees and lands of temporal

comprehending not only the fees and lands of temporal barons, but of bishops also, who have two estates,—one as they are spiritual persons, by reason of their spiritual revenues and promotions; the other grew from the bounty of our English kings, whereby they have baronies and lands added to their spiritual livings and preferments. Manors were formerly called baronies, as they still are lordships; and the manor court is still called Court Baron (which see).

Baroove, bar oak (Fr., rough, irregular), in Mus., is false and overcharged with modulation, while the intonation is forced and unnatural.

Baroscorz, bar-o-skope (Gr. baros, weight, skopeo, I perceive), a term sometimes applied to the barometer, but which ought strictly to be reserved for such an instrument as may show a change in the weight of the atmosphere without accurately indicating the pres-sure. The ordinary weather-glass, or wheel baro-meter, is, in accordance with this definition, merely a baroscope.

BARDSELENITE, bde'-o-sel'-e-nits (Gr. barus, heavy, selene, lustre), in Min., native sulphate of baryta, or heavy spar. It occurs in modified rhombic and rectangular prisms; also in compact granular or fibrous masses. It is much used, when ground, for adulterating white lead. It contains 66 parts of baryta and 34 of sulphuric acid.

BAROSMA, bör-os'-ma, in Bot., a gen. of plants belonging to the nat, ord, Rutacea. The leaves of several species, such as B. crenata, crenulata, and serratifolia, are used in medicine for their aromatic, stimulant, antispasmodic, and diurctic properties. They seem also to have a specific influence over the urinary organs. The plants yielding them are natives of the Cape of Good Hope. In commerce they are known as Buchu-loaves, and are thus named in the British Pharmacopoias. They con-tain a peculiar bitter principle called *Diosmin* or *Baros-*

mis, and a powerfully-scented volatile oil.

Baboucus, bar-ook (Fr.), a four-wheeled carriage, furnished with seats, as in a cosch, and provided with a top that can be raised or lowered at pleasure.

Harracan, barra-can (Ital. baracans), a sort of

## Barracks

thick strong stuff resembling camlet, but rather coarser in texture. It is used for making cloaks and other

in texture. It is used for making cloaks and other outer clothing.

BARRACKS, bir'-rik's (Bpan, barraca, a cabin or aut), a term in Mill, applied, in its modern meaning, to ranges of building erected for the reception and accommodation of large bodies of soldiers, including quarters for officers and men, officers' mess-rooms, guard-rooms, stables, hospitals, and various other requisite premises. It originally meant a rough wattled shad, hastiv not un for cavalry: those of a similar questive premises. It originally meant a rough watered shed, hastily put up for cavalry; those of a similar construction designed for infantry being called huts. During the Crimeau war the French and English troops wintered in huts of this description. Formerly soldiers were billeted on public-houses and the resi dences of private families; and few barracks, in the modern acceptation of the word, existed prior to the year 1782, when the ministry then in power wrung a reductant consent from parliament to erect barracks for the soldiery in and near many important towns and cities, which was carried into effect in subsequent years, under the superintendence of Lieut.-General De Laucy, as barrackmaster-general, with a staff of subordinate officers. The office of barrackmastergeneral was soon abolished; and the duke of Welling-ton, when commander in chief of the forces, about 1820, placed the barracks under the management of the Board of Ordnance, making an officer, known as the resident barrack-master, responsible for the care of the buildings, and all articles issued from the barrackoffice for each soldier's use,-consisting of an iron bedstead, paillasse, bolster, rug, two blankets, and a pair of sheets,—and furniture and utensils necessary for each separate mess or barrack-room, which is under the charge of a sergeant or corporal, and is inspected by a lieutenant or ensign daily. When the Board of Ordnance was broken up in 1855, the barrack department of the service was placed under the direct control of the War-office, the Royal Engineers having to take charge of the buildings, and to see that all necessary repairs are efficiently executed. necessary repairs are efficiently executed. Among the improvements in the condition of soldiers in barracks, effected in consequence of the royal commission in 1887, under the presidency of Lord Herbert of Lea (then Mr. Sidney Herbert), may be mentioned the extension of the number of cubic feet of space allotted to each soldier, varying from 600 to 1,000 feet, as in the new cavalry barracks at Aldershot (see CAMP AT AL-DESSHOT), and 1,200 feet in hospitals. Subaltern officers are allowed a room each, two sharing an apartment between them in former times; staff-sergeants and married sergeants have a room each; unmarried sergeants a room between two; about twelve or twent; four privates are placed in each barrack-room, according to size; married men are placed in separate quarters, and sergeants are allowed a separate mess-room. Great care is taken that the rooms shall be properly ventilated, and the provisions well cooked. Attention is also paid to the establishment of bathrooms, reading rooms, libraries, lecture-rooms, racket and tennis-courts, and other things necessary for the soldier's health, instruction, and smusement, which may tend to elevate his social condition, and gradually wean him from the debasing influences of drink and wesn him from the debasing influences of drink and other temptations that he is, generally speaking, too prope to yield to when leading a comparatively idle life in times of peace. The expense for building and repairing barracks in the United Kingdom of Great Britain and Ircland since 1793 is very nearly as follows:

—From 1703 to 1804, £4,115,000; from 1804 to 1819, £3,221,000; and from 1819 to 1862, about £6,000,000; giving a total of about £15,336,000. It has been ascertained that the cost per man in the erection of different harrack has varied as much as from £30 to different barracks has varied as much as from £30 to

All according to the manner in which they were built.—Ref. English Cyclopadia—Arts and Sciences.

BARRACCON. bir ra-koon, a station or depot on the soast of Africa, where captured slaves are collected together and guarded until they are removed by the traders in their vessels.

BARRATEY, bar-ra-tre (Old Fr. borat, from which is still retained barateur, a cheat; from the Dano-Norman baret, in Law, is the offence of frequently fronting and sturing up suits and quarrels between the Mejerty's subjects, either at law or otherwise; the

#### Rarrian

punishment for which is fine and imprisonment marine insurance, barratry is where the master of the ship or the mariners defraud the owners or insurers, whether by running sway with the ship, sinking her, unlawfully deserting her, or embezzling the cargo. To the offence of barratry may be referred another offence of equal malignity and audaciousness—that of swing another in the name of a fictitious plaintiff, either one not in being stall, or one who is ignorant of the suit. If the offence be committed in any of the superior courts, it is considered a high contempt, and punishable at the discretion of the court. In courts of a lower degree, it was by 8 Eliz. c. 2, s. 4, directed to be punished by six months' imprisonment, and treble damages to the party injured. (See also CHAMPERTY, MAINTENANCE.)

BARREL, bar'-rel (Fr. baril; Sp. barril), in Com., a HARRE, bar-yel (Fr. baril; Sp. barril), in Com., a measure of capacity; also the name of a versiol principally containing ale or beer. The barrel has more length than breadth, with a bulging in the middle, and is made of staves and headings, and bound with boops. In the metropolis, a barrel of beer formerly held 22 sie or 32½ imperial gallons. It was, however, enacted by 43 Groc. III. c. 69, that a barrel of beer should consist of 36 gallons. By a later envertuent it was accelly 3 (rec. 111. c. os., that a party of oper mount consist of 36 gallons. By a later enactment, it was decided that whenever any gallon measure is mentioned in any excise law, it should always be deemed and taken to mean an imperial gallon. Consequently, the barrel signifies, at the present time, 36 imperial

gallons.

Barrel, Gun. (See Gun-Barrel.)
Barren Iand, bör-ren (Sax. bare), in Agr., a term applied to soil in which trees, plants, or grasses of any kind cannot attain perfection, from a deficiency of any kind cannot attain perfection, from a denoting of the proper constituents necessary to their development and growth. When sterility arises from lightness of soil or an undue proportion of sand in the composition of the ground, it may be removed by proper irrigation and the addition of heavy earth, mixed with rich loamy soil. In heavy clay lands, on the contrary, the soil must be well drained and lightened by the admixture of sand, lime, and decayed animal and vegetable matter. The acid properties of some soils, which produce coarse rank grass, sedge, and rushes, and the presence of metals, such as sulphur and the peroxide and protoxide of iron, in too great quantities, in combination with acids, are most readily corrected by the use of lime, which is also bereficial in removing the tannin, an injurious element in the composition of soils of an astringent nature, such as peat lands, consisting of vegetable substance, the decay and change of which of regetable substance, the decay and change of which into loam is prevented by the astringent element just mentioned. The want of many mineral substances in substances in the britant with the substances in Barricant, birri-kaid' (Fr.), in Mil., a term employed to distinguish the temporary defences raised in order to obstruct the attacks of an enemy in the field.

It is still more generally employed to denote the deit is still more generally employed to denote the de-fences thrown up in towns during a time of revolution or insurrection. At such times barricades are com-posed of whatever substances are nearest at hand; carts filled with stones, buskets of earth, household furniture, and bales of wool or cotton, have all been employed for this purpose. During most of the revo-lutions in Paris; the populace have made barricades by raising up and pilling together the paving-stones of the streets. The present emperor. however. has. the streets. The present emperor, however, has, during his reign, caused all the principal streets to be macadamized, and all the footpaths to be made of sphalte. The term barricade is occasionally applied to the barriers which defend a fortress.

BARRICADE, in Mar., a term denoting a strong wooden rail, supported by stauchions, which extend across the foremost part of the quarter-deck. The upper part contains a double rope netting above the rail, and is stuffed full with hummocks-gible spaces between the stanchions being filled with pieces of cork. old cables, mats, &c., to prevent the execution of amail shot during a navel engagement.

BARBICARRI SKEDS, blar -is, the produce of the Adenuathera pavonia, a leguminous plant. They are of

Adenuathera paronia, a leguminous plant. They are of a bright red colour, and are employed in the northern parts of South America at beads for making neck-

BARRIER, bar'-ri-er (Fr. barrière), in Fortification, a piece of woodwork or fence, which presents an ob-

stacle to passing through any estrance where it is fixed stacle to passing through any satrance where it is liked. Barriers of this kind are generally composed of great stakes four or five feet high, placed at a distance of eight or ten feet from each other, with transoms or overthwart rafters. Their purpose is to prevent the entrence to any passage or intrenchment of horse or foot. In the middle is a movable gar, which can be opened or shut as required. The term barrier is also used to signify a fortification or strongly-guarded place on the frontiers of a country. The barrier fortresses of Flanders are instances.

of Flanders are instances.

Barrier Act is the name given to an act of the General Assembly of the Church of Scotland, passed in 1997, to prevent the too hasty adoption of any important measure. The proposal of any alteration in the rules or constitution of the church must first be brought before the General Assembly in the form of prougnt. perors the General Assembly in the form of an overture, when, if approved of, it is then transmitted to the several presbyteries for their consideration, with injunctions to forward their opinions to the next General Assembly, by which it may be passed into law only if it have obtained the concurrence of the majority of the presbyteries.

of the presbyteries.

BARKIER ERF, a name given to any coral reef which runs parallel to the shore, but separated therefrom by a channel. The great barrier reef along the northeast coast of Australia is composed of a chain of huge masses of coral rock, and is more than 1,000 miles long and from 10 to 90 miles in width. (See Coral Reff.)

BARKIER TERATY is the name given to a treaty entered into between the Dutch and the emperor of Germany in 1716, shortly after the peace of Utrecht. In terms of this treaty, Austria received possession of all the provinces which had belonged to Spain, with the addition of the greater part of the places taken during the war with France. A large force, consisting of not less than 30,000 men, was to be maintained in the country, whereof the emperor was to furnish the country, whereof the emperor was to furnish three-fifths, and the States the remainder. The annual sum of 500,000 crowns was to be paid by the emperor towards the payment of the Dutch troops; and he solemnly engaged not to transfer these provinces to a prince of the house of Bourbon, either by sale, mar-

riage, or otherwise.

BARRING-OUT, bar'-ring, a practice, which was of frequent occurrence in schools in former times, of securing the doors and windows of the school-room, when a suitable opportunity presented itself, against the entrance of the head master and his assistants. It was generally done a short time before the vacations, to secure some additional holidays, or to obtain the re-moval of some fancied wrong. The boys national to moval of some fancied wrong. The boys native to lay in a store of estables to sustain themselves during lay in a store of estables to sustain themselves curing the siege, and obtained their demands if they were able to prevent the master from effecting a forcible entrance within three days. It is said of Addison, that he managed a barring-out when a boy of twelve years of age at school at Lichfield. At a barring-out at the High School, Edinburgh, in 1595, fatal reensued; one of the city magistrates, under whose ensued; one of the city magnitudes, under whose patronage the school happened to be, being shot dead by one of the boys, in an attempt on the part of the authorities to force an entrance. Sir John Deane, founder of Witton school, Cheshire, ordered the pupils to observe the custom twice a year,—a week before Christmas and Easter.—Ref. Brand's Popular Antiquities. Chemberg's Equalization

Christmas and Easter.—Ref. Brand's Popular Antiquities: Chamber's Encyclopedia.

BARRINGTONIA, bar-ring-to'ni-a (in honour of the Hon. Daines Barrington), in Bot., the typical gen. of the nat. ord. Barringtoniacea, consisting of small trees conspicuous for their beauty. B. speciesa, the Moordilla, a native of Ceylon, has dark glossy leaves, and white flowers delicately tinted with crimson. Sir Fmerson Tennent says that the stamens, of which there are nearly a hundred to each flower, when they fall to the ground, might almost be mistaken for nainters' trushes.

painters' brushes.

painters' brushes.

BARRINGTONIACER, bir'-ring-to'-ni-ri'-se-s, in Bot., a small nat. ord. of dicotyledonous plants, in the subclass Calgrifors. They are usually placed among the Myrtaces, which they resumble in most essential particulars. The species are all natives of tropical regions, and most of them have poisonous properties. The bark of Strandium racemosum is said to be febringal; the fruit of Carcya arbores is edible; while that of 313

### Barrow

Gustava braziliana is emetic, and produces an intextcating effect upon fish.

BARRISTER, bar'-ris-ter (from bar, or barr, and Old BLRUSTER, bar-rister (from bar, or barr, and Cld Fr. ester, to remain or continue: thus the combination of the two forms, barrester, one who takes his station at a bar; who continues there, that is, who carries on his profession at the bar; a pleader of causes).— Barristers were first styled apprentices (apprentices at legem), from Fr. apprendre, to learn, who answered to the bachelors of the universities, as the state and decree of a seriestal farmients and learns. the state and degree of a serjeant (servientes ad legem) did to that of doctor. Apprentices or barriers as agenty did to that of doctor. Apprentices or barriers esem to have been first appointed by an ordinance of King Edward I., in parliament, in the 20th year of his reign. (Spelm. Gloss. 37; Dugdale, Orig. Jurid. 55.) The time before they ought to be called to the bar, by the ancient orders, was eight years (afterwards reduced to five) and the exercises done by them (if they were not called ex gratia) were twelve grand moots, performed in the inns of chancery, in the time of the grand readings; and twenty-four petty moots, in term time, before the readers of the respective inns of court. The privilege of conferring the rank or degree of barristerat-law is exclusively enjoyed by the inns of court, which are the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn. The possession of this rank (or of the higher degree of serjeant) constitutes an indispensable qualification for practising as an advocate in the superior courts at Westminster. No other means of obtaining it exist but that of becoming enrolled as a of obtaining it exist but that of becoming enrolled as a student in one or the other of these inns, and apply-ing, after a certain period, to its principal officers (or benchers) for a call to the bar. As a qualification for a call, the student must have kept commons for three years (i. s. twelve terms), by dining in the hall of the society at least three times in each term; and it is further required by the society of Liacoin's Inn that he should have been a member for five years, unless he have taken the degree of meater of strice repetitions. he should have been a member for any year, aness he have taken the degree of master of arts or bachelor of law in the universities of Cambridge, Oxford, or Dublin, or unless he shall apply to be examined in law, and pass a sufficient examination therein, in which case three will be sufficient. The benchers have the power of conferring the honorary degree of barrister on whom they will, without these requirements, as in the case of the present Prince of Wales, who was lately called to the bar by the society of the Middle Temple. The qualifica-tion above alluded to involves nothing of academical discipline or institution, nor is it necessary for the applicant for a call to the bar to be subjected to any previous examination as to his professional knowledge. But lately, leging have been instituted, and an annual (optional) examination in law and high degrees of scademical learning established, of students proposed for the bar, with prizes and certificates for the most distinguished. The business of legal education has been long conducted in private channels, a method which experience has proved to be efficacious; the usual plan being to obtain admission into the chambers of a practising barrister, conveyancer, or special pleader, where, in addition to the opportunities of observing the course of practice, the pupil enjoys for some time the advantage of tuition in the grounds and principles of the law. As to the privilege of barristers from arrest, see Alexen: and as

privilege of barristars from arrest, see Arrest; and as to their duties and general privileges, see Coursel.

Barrow, bar-ro (Sax. bereice), in Archæol., a name given to large artificial mounds of earth ruised over the graves of warriors and men of renown in bygone ages. There are many barrows in Great Britain, particularly in Wiltshire and Dorsetshire. Some of these have been explored, and human remains have been discovered in them, deposited in a rough stone coffin, or, in cases where the body had been previously burnt, in a sepulchral urn made of clay. Fint stone conin, or, in cases where the body had osen previously burnt, in a sepulchral urn made of clay. Find arrow-heads, weapons of brass and iron, coins, bracelets, and cups, have also been found in them. The barrow called Silbury Hill, near Marlborough, in Wiltshire, is one of the largest in this country, being about 170 feet in height, and covering an area of nearly six acres. When barrows of this enormous size were reised, it is probable that they were intended to common the same great battle, or other important event. memorate some great battle or other important event, and must be considered as serving a monumental purpose, for which we should use an obelisk or column in the present day.

## Barry

Barry, bur'ere, in Herr, when the shield is divided by horizontal lines into more than five equal parts, it is described as barry of so many pieces as there are divisions. The field of a shield is described as barry-bendy when it is divided evenly into lozenge-shaped pieces by the intersection of transverse and diagonal lines; and barry-pily when it is divided by diagonal lines from left to right and right to left, into pieces of the form of a wedge. the form of a wedge.

Bars, bors, in the menage, are the upper part of the gems, between the tusks and grinders, which bear no teeth, and to which the bit is applied, and by its fric-

BALER, bar-ter (Sp. baratar), in Com., is the ex-chasging of one commodity directly for another, with-out the employment of mosey or any other medium of exchange. This is the usual mode of exchange among savage or uncivilized races, and it is likewise generally adopted by civilized nations in trading with savages; thus the traders with the North-American Indians purchaseskins by bartering guns, powder, axes, and such-like. The term seems to be derived from the Italian word barattare, which signifies to cheat as well as to barter. A system of barter can only exist in the earliest commercial state of a people; for as commercial intercourse extends, the necessity of a standard of value becomes apparent, not only to facilitate operations, but to prevent that species of over-reaching which necessarily attends barter. The exchanges of a civilized people amongst themselves, or with other countries, are principally carried on by means of bills of exchange, so cipally carried on by means of bills of exchange, so that the actual money payment in a country by no means represents the amount of its commercial transactions. In some parts of England, particularly in the mining districts, wages are paid in articles of communition instead of money; and this is termed "trucking," from the French word troe, which signifies barter. It is, however, illegal.

Barracionwe Fair, har-thol-o-mu, was first held in the year 1133, and was conducted by the monks and

the year 1133, and was conducted by the monks and priests of the church and priory of St. Bartholomew, which was situated in West Smithfield. The first charter was granted to a monk named Rayere, who had been jester to Henry I. In addition to the usual buybeen jester to Henry I. In addition to the usual buy-ing and selling, the fair was distinguished by the miracle-plays and mysteries of the priests, by athletic sports and games, and by the public disputstions of the scholars from the London schools. In the middle of the 15th century the fair had greatly increased, and had become an important market for cattle, cloth-stuffs, leather, &c. It was always held on the 24th angust, St. Bartholomew's day, and the variety of exhibitions, booths, mountebanks, and theatrical performances, made the gathering very popular. Henry VIII. sup-pressed the priory of St. Burtholomew, and the charter was then transferred to the corporation of London. After that time the fair began to lose its character, and towards the close of the 18th century a row of houses was built on the site of the cloth fair. The name is retained still. In 1503, the year of the great plague, the fair was not held. The proceedings usually lasted three days; but after the restoration of Charles II. they were prolonged to fourteen days. In 1701, however, the fair was represented as a nuisance; and the traffic gradually lessened from that period : it became an annual exhibition of debauchery and dissipation. Many unsuccessful attempts were made to suppress it, but it was not until 1840 that it was removed to Islington, where it struggled feebly for existence. It was finally abolished in 1855.

BARTHOLOURW'S DAY, a feetival of the Church, observed on the 24th of August, in honour of St

Bartholomew.

Bartholomew. Sr., MASSACES or, an atrocious carnage that took place in France, on the night of St. Barthalomew's day, 1572. The king, Charles IX., at the instigation of his mother, Catherine de Medicis. The queen dowager, invited to Paris, under a solemn such of safety, the principal Protestants of the kingdom in order to celebrate the marriage of the king of Navarravith the sister of the French king. On a given signal at midnight, the massacre sommenced; men, women and children were involved in one common destruction. The nits reasonable with the growns of the driver, the The city resounded with the grouns of the dying; the

dead bodies were cast into the streets, and the channels flowed with blood. In Paris alone, it is said that more than 10,000 persons were put to death on that night. But the butchery was not confined to Paris: at Orleans, Rouen, Meaux, and other places throughout France, similar cruelties were perpetrated; so that in all, according to Sully (whose account is the received one), 70,000 persons were massacred on this occasion.

BARHOLOMYRES, bar-thol'-o-mites, a religious order founded at Genoa in 1307, but suppressed by Popo Innocent X. in 1650, in consequence of the irregularities of the monks. In the church of the monastery of this

order, at Genoa, is the image pretended to have been sent by Christ to King Abgarus.

BARTIZAN, bar-ti.xam, in Mediaval Arch., a small round turret, with an arrow-slit or very narrow window, generally projecting from the angle of a square tower, on the corner of a gable of a building, and supported on a corbel or bracket. Its chief use when thrown out near the top of a tower seems to have been for the near the top of a tower seems to have been for the purpose of enabling any one on guard to keep a look-out on persons approaching the eastle, from a place of shelter and safety; or, when placed over or near a gateway, for defensive purposes.

Barron Erbs, bar-ton, in Geol., a group of tertiary beds, included in the Bagshot series. They consist of greenish-grey sandy clay below, massing up into bluish-green and brown clay, interstratified occasionally with heds of sand and loam.

hede of sand and loam.

BARU. (See SAGUERUS.)

BARUCH, THE PROPHECT OF, bair-uk, is the name of one of the apocryphal books subjoined to the canon of the Old Testament. Baruch was the disciple and amanuesis of the prophet Jeremiah, and this book has been reckoned part of Jeremiah is prophety, and in often cited by the ancient fathers as such. It is said, in the preface to the book, to have been written by Barnch at Babylon, by the appointment of the king and the Jews, and in their name; that it was after-wards read to them for their approbation, and then sent to Jerusalem, with a collection of money, to Joa-chim the high priest, and to all the people. The Jews sent to Jerusalem, with a collection of money, to Jon-chim, the high priest, and to all the people. The Jews rejected this book, because it did not appear to have been written in Hebrew; nor is it in the catalogue of sacred books given us by Origen, Hilary, Rufinus, and others. St. Cyril of Jerusalem, however, and the Lao-dicean council, held in 364. mention Baruch among the dicean council, held in 302. mention Barden among the canonical books of Scripture, and join it with the pro-phecy of Jeremiah. There are three ancient copies of this book extant,—one in Greek, the other two in Syriac; but in which of these languages, or whether in-may of them, it was originally written, is uncertain. Barwoor. (See Barhia.)

BARYSTRONTIANITE, bar-i-stron'-shaw-ite, in Min., a mineral found in Orkney, containing a mixture of carbonate of strontia and sulphate of baryts. It is

also known as Stromnite.

BARYTA, or BARYTHS, ba-ri'-ta (Gr. barus, heavy), in Chem., one of the alkaline earths, discovered by Schoole, in 1774. It is met with, combined with sulphurie acid, in cank or keavy spar, and combined with carbonic neidin witherite. It may be formed by decomposing the nitrate by a red heat. It is now similar in the second heat. by a red heat. It is very similar in its properties to caustic lime. It is greyish-white; becomes not when caustic lime. It is greyish-white; becomes hot when moistened with water, falling to a fine white powder, forming the hydrate. Its specific gravity is about 4. It has an extremely acrid caustic taste, and is very poisonous. It dissolves in 20 parts of water, forming baryta-water, much used as a chemical reagent. Boiling water dissolves half its weight of baryta, and deposes, on cooling, four- or six-aided prismatic stystals, containing 10 equivalents of water

BARTA, CARBONATE OF, found native as seitherite. It is used as the source of many baryta salts. It is a dense white powder, falling as a precipitate when a soluble carbonate is added to a solution of baryta salt.

solution carrotted is acrea to a solution of contract and it is nearly insoluble in water, but dissolves readily in sectic, nitric, hydrochloric, and several other acids.

BARYTA, NITATE OF, in Chem., formed by dissolving the carbonate of baryts in very dilute sitrio acid, and evaporating and crystallizing. It forms white, transcurporating and crystallizing. It forms white, trans-lucent octahedra, which are subydrous. It is soluble in 8 parts of cold and 3 parts of boiling water. It is used principally in the preparation of baryts for che-mical purposes, and for detecting acids in analysis.

#### Parvie

BARYTA, THE SANTS OF, are readily recognized by giving a dense white precipitate, insoluble in the acids on the addition of a soluble sulphate. The carbonate and all the soluble salts are powerful acrid The best antidote is sulphate of sods or poisons. The salts not enumerated above are unimportant.

BARYTA, SULPRATE OF, found native in the form of heavy spar. It may be readily formed by adding a soluble sulphate to a seluble sait of baryta. It is a dense white powder, insoluble in soids, and is some times used as a pigment, under the name of permanent white. Sulphate of baryts, or heavy spar, found in the lead-mines of the North of England, is the source of most of the baryts salts. The insolubility of sulphate of baryts, in acids renders, the salts of baryts valuable tests for the presence of sulphuric acid in any compound.

BARYTO-CALCITE, ba-ri'-to-kal'-site, in Min., a mineral containing carbonate of baryta and carbonate of lime; also called Alstonite, from being found in the lead-

mines of Alstone Moor.

BARTANE, or BABITOWE, bar'-i-tone (Gr. barus, heavy, and tones, tone), in Mus., a tone of the voice the compass of which lies between the bass and tenor. It is the lowest but one of the six registers into which the human voice is divided, and is the commonest kind

the human voice is divided, and is the commonest kind of male voice. The mezzo-soprano, or middle female voice, corresponds with it an octave higher.

Basatt, ba-soll (frem basal, an Ethiopian word for iron), in Geol., a close-grained, hard, black, or dark-brown rock, of igneous origin, occurring both in the Trap and the Volcanic series. It is one of the Dolerites or Augitic lavas, and consists essentially of augite and felspar, the former being in excess. often contains crystals of the olive-green mineral olimne, grains of magnetic iron, and other bodies.
Masses of basalt are frequently found divided into columns or prisms, with three, five, or more sides.
That this columnar structure is the result of contractions. tion on consolidation, is shown by the prisms usually being at right angles to the greatest extension of the raise, that is to say, being vertical in an horizontal bed, and horizontal in a vertical dyke,—proving that the ilssuring commenced at the cooling surfaces, and struck thence directly towards the centre of the mass. Sometimes it is found that the two sets of prisms thus originating at each surface did not exactly fit when they met in the centre. At other times, however, the prisms proceed uniquerruptedly from side to side, the two sets either haring coalesced, or one surface having cooled before the other, and given rise to divisite any were carried right across the mass. In addition to these prismatic joints, other irregular joints, more or less nearly at right angles to the prisms, also occur; and in very regular columnar basalt the columns are articulated, or separated at regular or irregular inter-vals, into short blocks, by divisions, which are some-times quite flat, and sometimes curved into concave and convex surfaces, forming an approach to the ball-and-socket joint. The origin of this structure is explained by the celebrated observations of Gregory Watt. If a mass of basalt by melted in a furnace and allowed to cool again, the following results are observed:—If a small part be removed and allowed to cool quickly, a kind of slag-like glass is obtained, not differing in ap-pearance from obsidian: if it cool in larger mass, and more slowly, it returns to its original stony state. During the cooling, small globules make their appearance, which increase by the successive formation of external concentric coats, like those of an onion; and the simultaneous obliteration of the previously-formed internal coats, so that, ultimately, a number of solid balls are formed. As these balls continue to increuse in size, their external coats at length touch, and then they mutually compress each other. Now in a layer of equal-sized balls, each ball is touched by exactly six others, and if all be squeezed together by an equal force acting in every direction, each ball will necessarily be converted into a regular hexagon. The same result will also follow from an equal expansive force acting from the centre of each ball, or from the tendency to indefinite enlargement in their concentric coats. Thus could spheroidal mass, under favourable circumstances, will assume the form of a short hexagonal pillar.

#### Base Fee

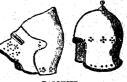

there are many layers of balls, each ball resting directly and centrically on the one below it, a long column of these hexagonal joints will be formed, and the top and bottom of each joint will be flat, conver, or concave, according to variations in the amount and direction of the pressure at the ends of the columns. There is no apparent reason why, in a cooling mass of basalt, the halis should be arranged so that their centres should be in straight lines, and that the hexagonal joints should form straight continuous pillers, rather than separate discontinuous parements. This, however, is probably the result of the simultaneous tendency of the mass to split into prisms on consolidation. The pillers of basalt are usually from six to eighteen inches in diameter, and vary in length from five or six to 100 or 150 feet. Basalt is rarely, if ever, found as an underlying rock, but generally occurs as a dyke or as an overlying mass. The most celebrated plateau of basalt is that in the north-east of Ireland, covering almost the whole county of Antrim. This entire mass 1200 and 50 miles long by 30 joints should form straight continuous pillars, rather almost the whole county of Antrim. This entire mass is 300 or 400 feet in thickness, and 50 miles long by 50 wide. The basalt occurs in three or four sheets, in many places beautifully columnar, and interstratified with beds of volcanic ash, or "ochre," as it is called. One of the columnar beds dips gradually into the sea on the north coast, and is known as the Giant's Cause-The basalt of the West of Scotland is very remarkable for the beauty and regularity of its columns. At Fingal's Cave, in the island of Staffa, the arrangement of these basaltic columns was long regarded as the masonry of a race of giants .- Rej

regarded as masonry of a race of giants.—Lef. Jukes's Manual of Geology.

BASANITE, bits'-d-mite (Gr. basanos), a species of schistose hornblende, used for testing the purity of gold. The gold is rubbed on the stone, and the mark is touched with aquafortis. The amount of copper con-tained in the gold may be easily guessed at by the

change of colour the streak undergoes.

BASCINET, BASINET, OF BASNET, bass'-i-net, a light helmet sometimes having a but more often without one, and basin - shaped, whence the name. During the reigns of Edward II. and Edward III. it was the common form of defensive

BASCINET.

Hasciner.

All the state of the placed, consisting generally, in the five orders of architecture, of a square plinth and mouldings, formed of tori, fillets, cavettos, and astragals, in various combi-nations, between the plinth and the bottom of the shaft. The height of the whole base, including plinth and mouldings, is about half the diameter of the shaft at its lowest or broadest end. The Greek Doric column is the only form of pillar that has no base. In Gothic architecture, the base became higher and more varied in form than in examples of orders of the classic

Base, in Chem., a term applied to those bodies which unite with acids or halogens to form salts or bodies analogous thereto. The basic property of an element is not absolute, but only relative; as the same body may act as a base or an acid with a different element. Thus we find chromium acting as a base in the form of sesquioxide, but as an acid in the form of teroxide or chromic acid. The bases in inorganic chemistry are generally oxides, the organic bases being analogous to them. (See ORGANIC BASES.) (For the relative busic

relations of bodies, see AFFINITY.)

BASE, in Fort., the exterior side of the polygon, or that imaginary line which is drawn from the flanked angle of a bastion to the angle opposite to it.

Base, in Mus. (See Bass.)

Base Court (Fr. cour basse) is any inferior court that is not of record; as the Court Baron, &c.—Ref.

Kitch, fol. 96, 96.

Base Fer, is one of the three kinds of estates in fee-simple, and has a qualification subjoined thereto, which

must be determined whenever the qualification annexed to it is at an end. As in the case of a grant to A and his heirs, tenants of the manor of Dule, in this instance, whenever the heirs of A cesse to be tenants of that manor, the grant is entirely defeated; so, when Henry YI. granted to John Talbot, lord of the manor of Kingston-Lisle, in Berks, that he and his heirs, lords of Kingston-Lisle, in Berks, that he and his heirs, lords of the said manor, should be peers of the realm, by the title of barons of Lisle, here John Talbot had a base or qualified fee in that dignity (Co. Litt., 27 a); and the instant he or his heirs quitted the seignory of this manor his dignity was at an end. The estate is a fee-simple because it is limited to the heirs general, and may by possibility endure for ever; yet, as that duration depends upon the concurrence of collateral circumstances which qualify the duration, it is, therefore, not an absolute, but a qualified or base fee. It is proper to observe, with respect to this term of base fee, that it has usually a more restricted application, viz., to that species of qualified fee which is created where a tenant in tail conveys his estate by bargain and sale. a tenant in tail conveys his estate by bargain and sale, &c., and which Lord Coke describes as a determinable fee derived out of an estate tail; and in the act for abolition of fines and recoveries, 3 & 4 Will. IV. c. 74, its meaning is, by express provision, confined (so far as that act is concerned) to the estate created by the adienation of the tenant in tail where the issue are barred, but those in remainder or reversion are not. Base KNIGHTS, an order of knights inferior to barons and bannerets.

BASE-LINE, in Persp., is a line drawn at the extremity of the principal visual ray, and perpendicular to it. The base-line, in Surveying, is a principal line measured with the greatest precision on which a tri-angle or a series of triangles may be constructed,

BASE OF A SOLID FIGURE is its lowest plain side, or that on which it stands; and if the solid has two opposite parallel plain sides, and one of them is the base, then the other is also called the base. Base of a triangle, or any other plain figure, is usually that which lies the lowest; but any side may be the base, according to the position in which it may be conceived to be lying or standing.

BASE SERVICES, under the feudal system, were such as were fit only for pensants or persons of a servile rank; as to plough the lord's land, to make his hedges,

Page ; is to prough the lord stand, to make in steeges, to carry his manner, or other mean employments.

Basel, Council or, bal, is the name given to an important ecclesisatical council held in the city of Basel, in Switzerland. It was summoned by Pope Martin V. and his successor Engenius IV., in conformity to a decree of the council of Constance, and met on December 14, 1431, under the presidency of the cardinal-legate Julian Cesarini. The two great objects of the council were the reconciliation of the Hussites to the Roman Catholic church, and the re-formation of abuses in the Church itself; and the council was opened with an eloquent speech by the president. The former of these objects was contrary to the wish of the pope, who soon after issued his built for the dissolution of the council. The members, however, maintained that the pope had no power of dissolving a general council once lawfully convoked and assembled, and, on his continuing to issue bulls against them, they summoned Eugenius to appear at their bar. Notwithstanding the papeal bulls, the souncil concluded a peace in the name of the Church souncil concluded a peace in the name of the Church with the Hussites, to whom they allowed the use of the cup in the Lord's Supper. Through the intercession of the emperor Sigismund, a reconciliation was effected between the council and the pope, the latter revoking the bulls which he had issued against the council, and gave forth another, dated Docember 15, 1433, solemnly ratifying all its decrees. The council next proceeded to the reformation of abuses in the Church. The powers of the revoking ware much dismissed and his resumes

Savoy, under the name of Felix V., in his room. Many of the members had by this time withdrawn from the council, and these proceedings were generally dis-approved of by the Catholic world. The assembly, how-ever, went on to hold its sessions at Basel for five ever, went on to hold its sessions at Basel for five years longer. Its last session there was held in May, 1443. Subsequently, it continued to meet at Lausanue till 1449, when, after the death of Eugenius and the resignation of Felix, an amnesty was offered to thou by the new pope, Nicholas V., which they gladly accepted, and declared the council at an end. The decrees of the council of Basel are not admitted from any of the Ruyan collections, and are considered from any of the Roman collections, and are considered of no authority by the Roman lawyers. They are, however, recognized in points of canon law in France and Ger-many; and though some later concordats have modified the application of them, they have never been formally

the application of them, usey hard according to and entirely annulled.

BASEL, TREATIES OF, the name given to two important treaties of peace concluded at Basel on the Stapril and 22nd July, 1795: the former of these was between France and Prussis, the latter between France and Prussis, the latter between France and Prussis, and Spanja withdraw them. and Spain, by which Prussia and Spain withdrew them-selves from the coalition against France, and acknow-

selves from the coamon against rance, and acknow-ledged the republic. Prussis gave up to France all her possessions beyond the Rhine, while Spain ceded her portion of the island of San Domingo.

BASELLACEE, bis-et-lai-se-e (from basella, its Malabar name), in Bot., the Bueella family, a small nat. ord. of dicetyledonous plunts, in the subclass Monochlamydes. They are climbing herbs or the basella ship of the coards allied to Chemodicant ship to the property and the coards. class Monochlumydes. They are climbing herbs or shrubs, closely allied to Chenopodiaces (which see), but readily distinguished by having a coloured calyx, with two rows of sepais and perignous stamens. There are four genera and twelve species, all of which are tropical plants. Busella rubra and alba are used in the East Indies as substitutes for spinach. From the former species a purple dye may be obtained. The fleshy roots of Ullucus tuberosus, or Melloca tuberosa, a native of Peru, contain a great deal of starch, and are edible.

BASEMENT, baiss'-ment (Ang.-Nor.), in Arch., the lowest story of any building, generally sunk beneath the surface of the ground, in private houses containing the kitchens and cellars. In public buildings of any architec-tural pretensions the base is, for the most part, low and of massive appearance, formed of "rusticated" masonry or stones, the outer surface of which is hewn into a rugged indented form, with a projecting band above, or cornice, which serves as a support to pilasters running up the walls of the building between the windows, a Traiteball, London. There is no strict rule for the height of the busement story; but it is generally regulated by the purposes for which it is intended, and the various uses to which the ground-floor above is applied.

BASHAW, BASHA, or PASHA, ba-shaw' (Arab. basha, head or master), a Turkish title of honour conferred on vicerors, provincial governors, and other distinguished men. The badge of a bashaw's authority, as well as the emblem of his rank, is the horse-tail, and he takes precedence according to the number of these on his banner: the highest is the bashaw of three tails. These bashaws exercise supreme civil and military authority in their respective provinces, and many of them owe little more than a nominal subjection to the

BASHI-BAZOUKS, ba'-she-ba-rooks', are icregular cavalry troops in the Turkish service. In the late war in the Crimes they were frequently engaged with the enemy; but they were turbulent and insubordinate. and plundered whenever occasion offered, so that they and plundered whenever occasion offered, so that they were generally more troublesome to their friends than to the enemy. W. H. Russell, in describing these "wild cavaliers," says, "it would have been difficult to find more picturesque-looking scoundrels if the world was picked for them from Scinde to Mexico. Many of them were splendid-looking fellows, with fine sinewy legs, beautifully-proportioned muscular arms, and noble well-set heads of the true Caucasian mould; others were hideous negroes from Nubia, or lean more others were hideous negroes from Nubia, or lean more than the state of the true of the state of the stat to the reformation of abuses in the Church. The powers of the pope were much diminished and his revenues cartailed, and punishments were appointed for certain cartailed, and punishments were appointed for certain moralities of the clergy. These proceedings greatly exasperated Eugenius, who summoned another council at Ferrars, and issued a bull for the dissolution of that at Ferrars, and issued a bull for the dissolution of that at Region in the population of the control of the cont

BASIL. (See OCYMUM.) BASIL. (See DOYMUR.)

BASILIAN MONES, be-silv-t-iss, in Eccl. Hist., were monks of the order of St. Basil, who lived in the 4th century. He retired into a desert in the province of Pontus, where he founded a monastery for the accommodation of himself and his numerous followers, and modation of nimself and its numerous followers, and, it is said, draw up certain rules, amounting to several hundreds, for the better regulation of this new society. This new order soon spread all over the East; nor was it long in extending also into the West. Some assert that Basil saw himself the spiritual father of more than 90,000 monks in the East only; but this order, which 80,000 monks in the East only; but this order, which ideurished for more than three centuries, was considerably diminished by heresy, schism, and a change of empire. It is said to have furnished 14 popes, 1,805 bishops, 3,010 abbots, and 11,085 martyrs. It likewise boasts of several emperors, kings, and princes who have embraced its rule.

Basilica, basil-i-kā (Gr. basilike, a royal residence, a palace), a term applied to the large buildings created in Rome, and other cities of the Roman empire, for the administration of justice. They also pripe, for the administration of justice. They also served the purpose of an exchange, in which merchants transacted their business, being generally built in the immediate neighbourhood of the forum. The following was the method of construction generally adopted. A large central space, about twice or three times as long as it was wide, was surrounded with columns, on which a roof, called the testudo, was supported. On either side of this space porticos were added, covered with a roof sloping from the columns of the testudo, and supported on the outer side by another row of smaller columns at a distance of about one-third of the breadth of the central space from those that held the main roof: a wall was afterwards substituted for the outer columns of the portice, to afford shelter to those within the building. The portico was divided into two parts by a floor, the upper part forming a gallery for the accommodation of those who were looking on at what was passing below, or perhaps for the exposure of commodities for sale, or for carrying on some handicraft trade. There was a vestibule, or large porch, at one end, and at the other a tribunal for the administration of justice, with a semicircular recess, or apsefor the judge's seat, with chalcidica, or chambers for the use of the judge, counsel, &c., on either side of it. Basilice were unknown in Rome until about n.c. 200, but after that time they were generally built in towns in all parts of the Roman empire. The best example we have of the old basilica, or hall of justice, is that at Pompeii, built on the south-west side of the forum, occupying an area of about 300 feet long and 110 feet occupying an area of about 300 feet long and 110 feet broad, including the external walls. The vestingle at the lower end, is 100 feet by 30; the testudo, or cent-area, about 192 feet by 54; the portioos surrounding the testudo being 24 feet wide, while the tribunal, at the upper end, is 54 feet by 30, with chalcidica on either side about 30 feet by 24. On entering the ves-tibule at the left-hand side, there is a staircase leading to the cellulation of the west. to the galleries of the portices. The early Christian churches, and, indeed, the churches of the present day, bear a strong resemblance to the old basilicas in their general arrangement; and it is probable that many of these old balls of justice and exchange at Rome were converted into places of worship by the first professors of Christianity in the imperial city. The central area corresponds to the nave; the portices to the asisles, which are commonly furnished with unsightly galleries; the vestibule to the space usually occupied by the tower at the west end of a church, or to the great western entrance in a cuthedral; and the tribunal of the Roman magistrate to the chancel and railed space inclosing the communion-table. In the old churches the resemblance was more striking, as the bishop's throne was placed in the semi-circular apse immediately behind the high altar, which was placed under a canopy in what was called the sanctuary. Among the most famous at Rome may be mentioned Trajan's Basilica, and those of St. Peter, built a.D. 330; St. Paul, 886; St. Agnes, 625; and St. Maria in Trastevers, 1135. Of modern Italian basilicas, used for the same purposes as those of ancient Rome, the best specimens are those of Vincenza (built by Palladio about 1550), Padus, and Brescia.—
Ref. English Cyclopadia—Arts and Sciences.

Basilican Cods, or Basilica, a Greek translation of Basilican Cops, or Basilica, a Greek translation of the Codex Justinianus, a code of laws collected together by Justinian I., emperor of Rome, in 527. The design of reducing this code of laws into one Greek book was frat commenced by Basil I., the Macedonian, emperor of the East, in the 9th century. The Basilican code, however, was not reduced to its present form till she early part of the 10th century, by Constantine VII., when it was published under the title of "Basilica repetita Praelectiones." From that period it became the common code of laws for the East.—Ref. Hanbold's Manuale Basilicarus. Manuale Basilicorum

Basilicon, bu-sil-i-kos (Gr. basilikos, royal, or of great virtue), in Phar., the name sometimes given to an ointment, composed of 5 parts resin, 8 parts lard, and 2 parts yellow wax. It is much used as a stimulant dressing to blistered surfaces, with a view to keep up the discharge; and as a vehicle for other stimulating substances, such as savin and Spanish flies. It is called ceratum resine in the Pharmacopæia. Formerly bu-silicon was prepared with yellow wax, pitch, resin, and olive-oil, and was hence named unquentum tetraphar-macum, 'the ointment with four drugs.'

MACUM, 'the ointment with four drugs.'

BASILICON DORON, (Gr., royal gift), the title of a work written by James I. for the instruction of his son, Prince Henry. It is divided into three books. The first is entitled "Ofa King's Christian Duty towards God;" the second treats of "A King's Duty in his Office;" the third expatistes upon "A King's Behaviour in Indifferent Things." This work, in common with the other productions of the regal author, possesses at present no great degree of interest, otherwise than at present no great degree of interest, otherwise than

as a literary curiosity.

Basilipiams, bās-i-lid'-i-āns, in early Eccl. Hist., is the name given to a religious sect founded by Basilides, a Gnostic of Alexandria, who flourished in the earlier half of the 2nd century. The two great dogmas which formed the groundwork of his system were those of emanation and dualism. He held that the unrevealed God evolved out of himself the several attributes which God evolved out of himself the several attributes which express the idea of absolute perfootion, being the intellectual powers, the mind, the reason, the thinking power, wisdom, might, and, lastly, the moral attributes. These seven powers, which he regarded as living, self-subsistent, and ever-active, together with the primal ground out of which they were evolved, constituted the lirst ogdoad, or octave, the root of all existence. Each of these spiritual essences proceeded to evolve out of viself continually numberless gradulous of out of itself continually numberless gradations of existences, each lower one being still the impression, the antitype, of the immediate higher one. As he had in his system seven homogeneous natures in each gradation of the spiritual world, so he is said to have al tout there were 365 such regions or gradations of the spiritual world, answering to the days of the year. One grand idea of this system was, that in different degrees, and under different forms of application, one law pervades all stages and kinds of existence; and that everything, from the highest to the lowest, is governed by a single law. How he accounted for the existence of evil does not seem clear; but he held that everywhere, as rust deposits itself on the surface of iron, darkness and death cleave to the fallen seeds of light and life,—the evil to the good, the ungodike to the godlike; without, however, the original essence being thereby destroyed. The whole course of this present world he considered as intended for such an end; that the godlike may be cleansed from all impurities, and restored to its original purity. He considered the development of the human race as a process of purification, which was to be perfected by Christianity. His great aim was to lead men to consider the whole universe as one temple of God. Faith in the justice and goodness of God rose in his mind above everything else; and when he was perplaxed with difficulties, his last words ever were, "I wil say anything sooner than doubt the goodness of Providence." The development of this system led Basilides, and his followed by the development of the system led Basilides. lowers into many erroneous opinions, particularly with respect to the character and mission of Christ, whom he did not regard as the Redeemer; and held that he differed from other men only in degree, and need that he differed from other men only in degree, and, like the rest, himself atood in need of redemption.—Ref. Neander's History of the Christian Religion, vol. ii.

Bastlisk, bdr's-lisk (Bosiliscus).—Although this

Rasilisk

Basset

creature has no affinity to that terrible serpent believed creature has no attinity to that terrible serpent beheved by the ancients to indict death by its gas, yet it is suffi-ciently ugly to engender an uncomfortable sensation. It is found in South America, and occasionally attains a length of three feet. Instead of the comb-like ridge of the ignams, the besilisk is furnished with a broad

of the iguans, the basilisk is furnished with a broad membrane running down its back, and a second, still broader, on the upper surface of its tail. This process is capable of either expansion or contraction. The hind part of the basilisk's head hears a remarkable pointed hood. Notwithstanding its unsightly appearance, the basilisk is a perfectly harmless reptile.

Basuren (Gr. basilisko, from basiliaus), a fabulous serpent, said to have been able to kill with its breath or sight only. According to Galen, its colour inclined to yellow; and it had three small eminences on its head. They were speckled with whitish spots, and presented the appearance of a crown. Alian says that its poison is so penetrating as to kill the largest serpents with its vapour only; and that it will kill a serpents with its vapour only; and that it will kill a man by merely biting the end of his stick. The sound man by merely bring the end of ins stock. The sound of its hissing is enough to frighten away all other kinds of serpents. According to Pliny, the basilisk is able to kill all those who look upon it. It is also called a cockatrice, from the belief that it was generated from eccuaries, from the best that it was general. All those details are put forth by Matthiolus, Galen, Dioscorides, Pliny, and Erasistratus. The absurdity of all the statements has since that time been thoroughly exposed. In some apothecaries shops, formerly, little dead ser-pents were exhibited, which were said to be basilisks. These were, however, only small birds without feathers, having their heads raised, wings like a bat's, eyes large, and necks very short. At Venice, and other towns on the continent, animals are shown which are called basilisks. They are, however, only small thornbacks, with their fins stretched out, and artificially arranged so as to resemble young cocks. This Calmet says he observed in an spothecary's shop in Paris.

BASILISE, a kind of ordnance used in ancient times and so called from its supposed resemblance to the fabulous serpent bearing the same name. It is now completely out of use; but, during the wars of Hungary, it was much employed by the suits n Solyman. The basilisk cannon three a 200-pound iron ball.

BASILOSATRUS. (See ZBUGLODON.)
BASIN, bai'-sin (Fr. bassin), in Geol., a term applied to any dipping or disposition of strata towards a common any upping or disposition of stress towards a common centre, which has resulted from the upheaval and subsidence of the earth's crust. The tertiary formations often occupy limited areas, and fill up the basins of the older strats; hence the use of such phrases as "London basin," "Paris basin," &c.

BASEN OF A DOCK, a place where the water is confined by double floodgates, or a caisson, and thereby prevented from running out at ebb tide. The use of it is to contain ships either before they enter, or after they come out of the dock in which they are repaired. Basin also implies some part of a haven, which opens from a narrow channel into a spacious receptacle for shinning.

BASKET, bas'-ket, an article of domestic use, made principally of the interwoven twigs of willow or birch-trees, and often of straw, rushes, or other articles. They are made in every variety of quality, and in every high of shape, and are used for holding all sorts of dry goods. The value of the baskets imported into Eugland during the year 1857 was £35,348. A large quantity of material for making baskets is also imported

into this country.

into this country.

Baring Brank, bde-king shark, a large, immensely strong, but still harmless species of shark. By the Irish it is called the sunlish. (See Shark.)

Basque Larquete, back, is the name given to the language spoken by the inhabitants of the Basque provinces of Spain and of part of Spanish and French Navarre. The people call themselves Euccaldunae, their country Euccaleria, and their language Euccara. For a long-time the Basque language was supposed to be a dialect of the Celtic; but later researches have that this is not the case, and that there is some shown that this is not the case, and that there is some ground for supposing it to be an ancient language, distinct from any of the other European languages; and it is said by some to have an affinity to certain of the Americ tongues. It seems to have been at one

time the language of the whole of the Spanish peninsula; for we ind traces of it in the names of mountains, rivers, &c., in almost every part of the country. The Busque language possesses a great variety of terminations. According to some, the neun has six esses; according to others, cloven. The verbs are said to bave cleven moods and forty-six tenses. The structure of the sentences is very simple. The substantive is always placed first; then the article; then the adjective; next the adverb; then the verb; and lastly the object, with the preposition affixed to it.

the object, with the preposition affixed to it.

Bas Briter. (See Relieve).

Bass, Base, or Basso, bains (Ital. basso), in Mus., are terms all of which have the same meaning, and signify the lowest or deepest part. The bass, or lowest part, is, with sound musicians, the most important of all the parts: it is, indeed, the foundation of harmony,—the support of the whole superstructure of the composition. The word base is technically used in various ways, as thosewed hass. fundamental base. mony,—the support of the whole superstructure of an composition. The word bass is technically used in various ways; as, thorough bass, fundamental bass, ground bass, figured bass, &c. A figured bass is a bass with figures written over or under each note, to indicate the accompanying harmonies. The term figured bass is used as synonymous with figurative bass, meaning a bass not confined to the plain canto-fermo style, but the conting with more freedom, and with a melody of its moving with more freedom, and with a melody of its own: for instance, the bass in Bach's arrangement of the Old Hundredth. Fundamental bass is that bass the Old Hundredth. Fundamental bass is that bass which forms the tone or natural foundation of the incumbent harmony, and from which, as a lawful source, that harmony is derived. To explain this by example:—If the harmony consists of the common chord of C, C will be its fundamental bass, because from that note the harmony is deduced; and if, while that harmony is continued, the bass he changed to any other note, it ceases to be fundamental, because it is no longer the note from which that harmony markets. is no longer the note from which that harmony results and is calculated. Ground base is used sometimes as synonymous with fundamental base, and sometimes as a base which starts with some subject of its own, and continues to be repeated throughout the movement, while the upper part or parts of the composition pursue a separate air, and supply the harmony. This kind of bass was greatly in fushion about half a century since, but has for some time been rejected, as an unnatural restraint upon the imagination, and productive of a monotonous melody. Therough bass is the art by which harmony is superadded to any proposed bass, and includes the fundamental rules of composition. This branch of musical science is twofold,—theoretical and practical. Theoretical thorough bass comprehends the knowledge of the connection and disposition of all the asverse chords, harmonious and disponant and while the upper part or parts of the composition pursue the sayeral chords, harmonious and dissonant, and includes all the catablished laws by which they are formed and regulated. Practical thorough bass is conversant with the master of taking the several chords on an instrument, as prescribed by the figures placed over or under the bass part of a composition, and supposes a familiar acquaintance with the powers of these figures, a facility in taking the chords they indithese figures, a facility in taking the chords they indi-cate, and judgment in the various applications and effects of those chords in accompaniment. The bass is that part of a concert which is the most heard, which consists of the gravest and largest sounds, or which is played on the longest pipes or strings of a common instrument, or on instruments larger than common for the purpose.

common for the purpose.

BASS, COUNTER. (See CONTRA-BASS.)

BASSE, OF SEA-PRECH, blues, a marine fish, the Labraz Lupus of Cuvier. The fishes of this gen. belong to the fam. Percide, or Perches, with whom they are closely allied. The basse is to be met with along the British and Dutch shores, and abundantly in the Mediterranean. By the ancient Greeks and Romans it was highly esteemed as an article of food. On account of its voracity, it was called by the Romans tupus (wolf), a name still retained as a designation of the species. It was held to be the most cunning of fishes; and Aristotle declares that when encompassed by a net, it Aristotic declares that when encompassed by a net, it would effect its escape by digging a tunnel for itself in the sand. Its length is generally from a foot to a foot and a half; but it has been found of a much larger size. There is an American species of bases, which is

termed by Cuvier Lupus macronatus.

BASSET, bits'-set, a term applied by miners to the

### Resect

emergence at the surface of different mineral strate from beneath each other. It is also applied to open-ings from or into mines from the surface.

Basser, a game at cards, played in a manner similar to that of the modern fare. It was formerly very to that of the modern faro: It was formerly very much played in France. The mode of playing is as follows:—The banker deals the cards in pairs, and each punter, or player, has a livest of thirteen cards, from which be selects one or more, and stakes on them. The principle of the game depends upon the corresponding card in the banker's pack turning up in an odd or an even place. When a player wins, he may either take his money or go on, risking his stake and gains. The first time this is done it is called paroli, or double; the second time, sept et la va, fifteen, &c.; the fourth time, quinze et la va, fifteen, &c.; and on the fourth time, trente et la va, intry-one, &c.; and on the lifth risk, scipante et la va, sixty-three, &c. In all cases the odds are greatly in favour of the banker: it is 1,023 to 1 against the player winning ten successive times. Louis XIV. issued some very severe decrees eigainst the game of basset, and after that time it was played under the name of pour et coutre. played under the name of pour et contre.

syed under the name of pour et conure. BASSET HOUN (Ital. corno di bassetto; Fr. cor An-BASSET HORN (itsl. corno di bassetto; Fr. cor Anglais), an instrument now but sedom used. Its tone is very sweet, and in solo passages it is capable of producing very striking effects. It resembles a hauthoy of a large size, a little bunt at the top. Its real compass comprises the notes contained between F bass and latt, except the note F sharp, which is deficient. As the person who plays the hauthoy generally takes this instrument, the next for it is result written a fifth instrument, the part for it is usually written a fifth

Bass Horn.—This instrument, formerly a great deal used in bands, has declined much since the intro-duction of the opbicleide, which it somewhat resem-les. The player of the bass-horn should possess a quick and correct ear, and a knowledge of thoroughbass, in order to perform acceptably. The instrument has been found rather imperfect, and is not now much used.

BASELA, bis'-sigg, in Bot., a gen. of plants belong-ing to the nat. ord. Supotaces. The species are trees, satives of tropical or sub-tropical regions. They are remarkable for their floshy flowers and oily seeds. In remarkable for their floshy howers and oily seeds. In India, the fatty oils procured from the ripe kernels of B. latifolia, the Madhuca-tree, and B. longifolia, the Biloopa-tree, are made use of for burning in lamps, for culinary purposes, for making soap, and, medicinally, for external applications in cutaneous affections. The fleshy flowers and fruits are used as food, and from the former an alcoholic liquor is distilled. The wood of B. langifolia and other species is very hard and durable. The Shea or Galam butter, which forms an important article of internal commerce in Central Africa, is thought by some to be the produce of a species of bassia.

Basso. (See Bass.)
Bassoon, bus-soon' (Fr. basson), a musical wind in strumeut, made of wood, and played by means of a bent mouth-piece and reed. It is supposed to have been introduced into England by Handel, as a kind of help to the hautboy, which it so nearly resembles in tone as to make it the natural bass of that instrument. The compass of the bassoon extends from double B The compass of the baseoon extense from course is flat up to B flat in all, three octaves, including all the intermediate semitones except B natural. When the baseoon ascends very high, the notes are generally written in the tenor clef.

BASSORA GUM, bde'-sor-a, a whitish or vellowish substance brought from the neighbourhoed of Bassors. It differs from most gums in being nearly insoluble in water. The plant yielding it is believed to be a species of Mimosa. It contains a peculiar principle, called Bassorin, which also exists in gum-tragacauth.

Bass Viol. (See Violonerile.)

Bass VIOL. (See VIOLONCELLO.)

Bass, or Bass, biss, a name commonly given to the inner bark of trees. Russian mate are manufactured from the bast of the lime-tree. (See Liber.)

Basnam, bis'-tird (Walch, bustardd; Fr. bdtard, of low birth; from Ang.-Sax. base, mean, disgraceful, and owl, source, origin).—In English Law, bastards are such children as are not born in lawful wedlock, or within a commutate; time effect its detarmination, and each had competent time after its determination, and are held to be nullius filii, the sons of nobody. If children be

## Bastille

born in ever so short a time after marriage, they at born in ever so short a time after marriage, they are legitimate; but, notwithstanding they be born during marriage, they may be proved bastards where the him-band be out of the kingdom of England for such time as will shut out the presumption of access to his wife, and by other cogent evidence; as by roof of the impotency, of the husband, or that he and his wife had no oppor-tunity (though both within the realm) of sexual inter-course within such neriod as is convisient with their tunity (though posts which was to consistent with their course within such period as is consistent with their being the parents, or even by proof of circumstances tending strongly to the inference that no such intertending strongly to the interence that no such inter-course (supposing it to be possible), in fact, took place. So in a divorce, after a decree of judicial separation, if the wife afterwards have children, they are bastards; for the law will presume the husband and wife live conformably to the sentence of separation, unless access be proved. And after a decree for dissolution access be proved. And after a decree for dissolution of the marriage on the ground of adultery, all children of the woman not born within due time thereafter, even though they may be begotten by the husband from whom she has been divorced, are illegitimated. And in case of a decree of nullity of marriage, all the issue born even before the divorce are bastards, be cause such divorce is always upon some cause which rendered the marriage unlawful and null from the beginning. But except where a divorce has taken place between the married parties, or evidence is given of facts sufficient to disprove their sexual intercourse, the law always presumes in favour of the legitimacy of a law always presumes in favour of the legitimacy of a child born to the wife during the marriage. Upon the same principle, too, legitimacy will always be presumed (subject to the same exceptions) with respect to children born after the coverture has ceased, by reason of the husband's death, unless the birth takes place so long afterwards that the child clearly could not be begotten by him. The extreme period is a point which has he not avently determined, and is left to the the law has not exactly determined, and is left to the decision of a jury, who are to judge of it according to the circumstances and the testimony which persons of experience may give of the course of nature on this subject. Bastards are incapable of being heirs. The civil law differs from ours on this point, and allows a bastard to succeed to an inheritance, if, after its birth, the mother was married to the father; and also, if the father had no lawful wife or child, then, even if the concubine was never married to the father, yet she and her hastard son were admitted each to one-twelfth of the inheritance; and a bastard was likewise capable of succeeding to the whole of his mother's estate, although she was never married, the mother being sufficiently certain, though the father is not. (See APPILIATION.)

BASTILLE, bas-teel', the name formerly used in France

to denote a fortress or state prison defended by towers or bastions. There were three buildings of this sort in Paris,—the Bastille de St. Antoine, the Bastille de St. Peris,—the Bastille de St. Antoine, the Bastille de St. Denis, and the Bastille du Tumple. The first is the most celebrated, and was built by Hugues d'Aubriot, mayor of Paris in 1369, at the Porte St. Antoine, and was originally intended as a defence against the English. It consisted, at first, of two towers, botween 70 and 80 feet high, with a gateway between them. It was sout changed from a fortress to a state prison, and two other towers, similar to the first, were built parallel to them, and the whole connected with massive walls. In 1333 two more towers were added, at equal distances to the first, and also united with strong masonry. The towers were each divided into four stories, and the summit of each was fortified with cannon. The whole building were each unruled into annon. The whole building was surrounded with a deep most; and the road into the inner courtyard was over a drawbridge. The unfortunate prisoners, who principally consisted of noblemen and men of letters, were confined within the towers, or in dungeons below the level of the ground. The walls of the towers were six feet thick; and light and air were admitted to the dungeons through narrow slits towards the moat; and the rooms in the towers sitts towards the most; and the rooms in the towers had glazed windows atrongly grated: A daily sum was allowed to the governor for the maintenance of each prisoner; and this sum, which was given by the king, varied according to the rank of the prisoner. The principal officers in command of the Bastille were the governor and the leader and the ros. The mode of arresting prisoners was by lettres de cachet, sometimes signed by the king himself, and countersigned by one of the ministers. After a prisoner was immured, his name

two

the

was never mentioned; he was always known by the number of the cell or dungton in which he was centined. Thus many persons became so shut out from the world, that some of them were forgotten; and in some cases Thus many persons became so shat out from the worse, that some of them were forgotten; and in some cases it was found impossible to discover who they were, and why they had been sent there. The most extraordinary captive in the Bastille was "the man with the iron mask." He was brought from the island of St. Marguerite to the Bastille in 1698, by M. de St. Mars, the newly-appointed governor. His face was never seen, and his fare was the most sumptuous that could be provided. The wowsman never set down in his presence. and his fare was the most sumptuous that could be provided. The governor never sat down in his presence. He died Nov. 13th, 1703. There are many conjectures as to who this mysterious prisoner could have been; the most probable supposition is, that he was the twin brother of Louis KIV., whose birth had been concealed by Cardinal Richelieu. The French mob attacked the Bastille in 1789, and it was yielded up to them, after a few hours, by M. de Launay, the governor, who was immediately afterwards nurdered and then beheaded. Seven prisoners were found inside, one whom was an Englishman, and he was deranged. The whole building was soon after demolished, by a decree of the mayor

was soon after and consistency of the last name, to beat with a sitch), a punishment attended with great pain, and often with bodily injury, consisting, in the strict sense of the term, in the infliction of blows on the soles of the term, in the infliction of blows on the soles are also as with a thick stick. It is sometimes applied of the feet with a thick stick. It is sometimes applied to beating administered on the body and limbs. Turkey and Russia are the only European nations in which this mode of punishment is sanctioned by law, and in both countries it is carried to a most unjustifiable extent, the sufferers being frequently maimed and injured for a considerable period, if not for life. In Russia, the instrument of torture is a heavy whip, the sufferers being frequently maimed and called the knout. The bastinado is a common kind of punishment in China, as well as in Persia and all Eastern nations professing the Mahommedan faith, blows being ordered by the Koran for many offences of a minor character.

BASTION, blatt-you (Fr.), a large mass of earth, usually faced with brickwork, or stones, and forming a tower which stands out from the ramparts surrounding s town or place to be defended. It corresponds with

ther with form the The time when bastions were first introduced into fortification is not known; they probably originated in the projecting towers on the walls of fortresses, used for the purpose of observing the enemy when close to the foot of the ramparts. After the year 1500 they were well known and much used. The town of Tarin, in 1546, was defended by complete fortifications, including four hastions. The Italian engineers soon become celebrated for their skill in military fortification after the invention of bastions. During the reign of Queen Elizabeth an Italian engineer, named Genebella, was employed in order to appearing the formation of a hastioned rampart round the castle of Caristrock, in the Isle of Wight. Bastions are now made of various kinds,—solid, hollow, regular, &c. Solid bastions are entirely filled up with earth up to the level of the platform of the guns, while hollow hastions have the interior level with the ordinary ground. Regular bastions are those which have their faces, tification after the invention of bastions. During the

flanks, &c., in due proportion. A denii-bastion, or spaulement, has only one face and one flank. A double bastion is when one bastion is raised within and upon the plane of another bastion. A flat bastion is one built in the middle of the curtain or wall connecting the two angles of a rampart. A composed bastion is one in which the sides of the interior judygon are unequal; thus making the gorges also unequal. A bastion is called deformed or irregular when the faces, flanks, &c., are not in symmetrical proportion; and a cut bastion, or bastion with a tenaille, is one whose salient angle has been cut off, and has, instead, an

salient angle has been cut off, and has, instead, an angle opening inwards, with two points outward. If the angle of a basion is less than 60°, it is found to be too small for the use of guns; besides, being so acute, it is easily battered down by the enemy.

Bar, bat (Chiroptera).—So much does this singular creature appear to partake of the character of the feathered tribe, that naturalists of an abusent date experienced a difficulty as to its proper classification in the system of nature. The anatomical and intestinal structure of bats, however, combined with their viviparous nature, their hair, &c., without doubt entitles them to be ranked as quadrupeds. Although the appellation "flying" has been given to certain groups of this class, owing to their mode of flight, they only possess the power of gliding from one point to another possess the power of gliding from one point to another by the agency of an expanded skin, which serves to buoy them; their agrial motion, consequently, differs only in extent from the leap of an ordinary manmal.
With the bats, however, the anterior members are as
completely organized for true flight as those of a bird. As in the birds, the bones supporting the anterior members are large, the humerus rather short, and the bones of the fore-arm long; but the latter are quite separate and movable, as in the human arm. The bones of the fingers, however, instead of being amaigamated, so as to form a single series, are all quite distinct, and, when extended, radiate widely from the wrist, the bones of which are of small size. The thumb which, the bonds of which are of a mass size. In a faith is short, but the other four ingers excessively elemgated: the first finger is the shortest, and the others of meanly equal length. The four long fingers and the bones of the arm are united by a delicate lestilery membrane, which is also united to the sides of the body as far as the extremities of the hind-logs, and sometimes fills up the space between them; and it is by the agency of the broad wings, formed by the exby the agency of the orona wings, to that the bats are enabled to flutter through the air. The thumbs of the anterior feet are small, free, and furnished with sharp curved claws, by which the animals can suspend themselves to any convenient projection. The thumbs of the auterior hands and the hind feet are the only means by which the but can progress along the ground, where, as might be expected, it is very swkward in its movements. Dentition varies in the different families, according to the peculiar nature of the creatamines, according to the pectnar nature of the creature's food. The body is covered with a soft down, but the membrane of the wings only exhibits a few scattered hairs. The tests are placed on the breast, and the young, when sucking, cling to that part of the mother's body, and are carried about by her. Their scusses of smell, hearing, and feeling, are very acute, and in some the nose is furnished with a membraneous clinting of most delicate extractors by a which the second foliation of most delicate structure, by which the sense of smell is greatly enhanced. The ears, in many kinds, are expanded, and capable of being folded down; while their full wings and the tissues of the ear and nose are so amply furnished with nerves as to enable them, even though deprived of sight, to pursue their flight through the narrowest passages without danger. On the approach of winter, the bat relapses into a state of lifeless inactivity, and in selecting a spot for hybernalittless mactivity, and in selecting a spot for hyberna-tion, appears to regard security from molestation be-fore say other consideration. "The hybernation of these animals," writes Mr. Bell, "is; indeed, one of the most interesting points in their economy. At an earlier or later period of autumn, according to their species, they retreat, generally in large congregations of various species together, to the most retired places, as under the roofs of houses and abunches in examp as under the roofs of houses and churches, in caverns, in the bollows of trees, and similar situations, where they suspend themselves by their hinder claws, with their head downwards. Here they crowd together, hold-

ing not only by the surface of the walls of their retrest, but by each other, one crowding over another so classly that it appears accreety possible fire such numbers that it appears accreety possible fire such numbers to county so small a space. The common but, or flitter-mouse (Vespertitio nipsettellis), is more frequently met in this country than any of the others. It makes its appearance in the twilight of fine summer eventings in lanes and short places, or haunts the vicinity of quiet streams, where any sort of noctural insects abound. Although not more than two and allfinders long, or about the size of the common brown mouse, it is very voracious, and must in a single evening consume a vast number of insects. In dull weather, no matter though it be the middle of summer, the flitter-mouse keeps within doors as though it were mid-winter. The long-eared bat (Piccotus aurius), like the flitter-mouse, is also commanly found in the vicinity of buildings. It is the most elegant of the bats, and certainly most easily temed, learning to come at a whistle and take flies from the hand. The come at a winste and take lies from the hand. The cars are very long and transparent; when the animal is alsoping they are concealed under the wings, whilst the inner lobe of the ear still projects, giving the creature the appearance of possessing short slender ears. The mouse-coloured bat (Vespertilio murinus), the long-eared bat (Piecolus auritus), and the great bat (Vespertilio mociula), also count among the well-known British bats. The horse-shoe bat (Rhinolophus) resembles the common bats in its general babits but Sritish bats. The horse-shoe bat (Rhinolophus) resembles the common bats in its general habits, but is even more nocturnal, being satisfied with nothing short of absolute darkness for its place of retreat. The animal derives its name fom the possession, above its name, of a singular leaf-like membraneous appendage, shaped somewhat like a horse-shoe. The

horse-shoe bats are abundantly distributed over the warmer regions of the earth, but Britain numbers but two of them,—the great and little horse-shoe The largest of these two measures two and a bat. The largest of these two measures two and a half inches in length, while the lesser is one of the smallest British species of the order. The most terrible of all the bats is the one that has earned for itself the title of Yampyre (Phyllostoma spectrum). Like the horse-shoe bat, it is furnished with a nose-crest; the canine teeth are large, and in almost all the species there are four incisors in both jaws. Some of them are so harms as to measure two and a half feet in the species there are so harms as to measure two and a half feet.

ton, agree in considering the bat in question dengerous to life, and the inter sites in that he has repeatedly seen both men and beasts who have been nucked, and has misstely examined their bleeding wounds. This authority, however, confesses that, although a constant observer in the ramper's country for the space of eleven months, he could never discover how the rampyre drains the blood. "I sign alone in the loft of a woodcutter's shandoused house in the forest; and though the vampyre came in and out every night, and is woodcutter's shaudoused house in the forest; and though the vampyre came in and out every night, and I had the fluest opportunity of seeing him, as the moon shone through the apertures where windows had once been, I never could be certain that I saw him make a positive attempt to quench his thirst from my veins. though he often hovered over my hammock." Azaro states, that the inhabitants of Paragnay have no dread of these animals, though they frequently enter the houses, and suck the blood of those who may in-

house, and suck the blood of those who may in-cautiously expose any part of their body.

BATATAS, buttait tax, in Both, a gent of plants be-longing to the nat. ord. Convolvataces. The most important species is B. stalis, the Sweet Potato, a native of the East Indies, but now cultivated in all tropical and sub-tropical countries for its tubers, which, when roasted or boiled, form a wholesome and highly-nutritious article of food. Next to make, the sweet potato is the principal food of the poerer classes in

America.

BATH AND BATHING, bath.—Bathing, in its most general acceptation, denotes the application to the surface of the body, or a part of it, of a medium dif-ferent, or of a different temperature, from that by which it is usually surrounded. The substance which constiit is usually surrounded. The substance which consti-tutes this medium is, in Med. language, termed a bath. tutes this medium is, in Med. languago, termed a bath. Baths are of various kinds, and are distinguished according to the substances of which they are composed, as water, vapour, sir, said; according to their temperature, as cold, tepid, hot; according to the mode of their application, as plunge, shower, douche; according as they are general or partial, natural or artificial. Undoubtedly the custom of bathing dates from the artifact sixtance of the human rane. from the earliest existence of the human race. At first they would use such natural baths as the rivers or seas afforded; but doubtless, in no long time, they came to employ artificial ones; and we find the warm both mentioned as early as the time of Homer. Afterwards both public and private baths came to be com-mon among the Greeks; but we know little of their construction and arrangements. The public baths were mostly in connection with the gymnasis, and were taken immediately after their athletic exercises. It was not until the reign of Augustus that the public baths at Rome came to assume that magnificence and splendour which afterwards characterized them. They were termed thereas, or hot baths; but they also contained cold baths. In the latter period of the empire, Rome contained an immense number of baths, in various parts of the city. Different authors reakon upwards of 800 of them; but the most calebrated were those of Arminas Armanians (Casachia Thiad-Thiad upwards of 800 of them; but the most celebrated were those of Agrippa, Antoninus, Caracalla, Diodetian, Domitian, Nero; and Titus. Those of Diodetian are said to have been capable of secommodating 1,800 bathers. The vestiges of these buildings that are still to be seen indicate the great magnificence of the original structures. Mr. Fergusson, in his "Handbook of Architecture," says, "There is nothing in the world which for also and grander can compress with these species there are four incisors in both jaws. Some of Architecture," says, "There is nothing in the world of them are so large as to measure two and a half feet which, for size and grandeur, can compare with these across the extended wings. There can be little doubt that their favourite food is blood; but the narratives of a first favourite food is blood; but the narratives of considering them with their broad wings, and so continuing till the fountain their broad wings, and so continuing till the fountain of life is exhausted, is, to say the less; open to discoveribes the operation:—"Knowing, by instinct, that the person they intend to attack is in a sound alumber, they generally alighe near the feet, where, while the creature continues faming with its enormous wings, which keeps one cool, he bites a piece out of the tip of the great toe, so very small, indeed, that the person they intend to attack wound, which is censequently not painful; yet knowing, by instinct, the of the great toe, so very small, indeed, that the principal parts of a Roman bath." Their pavements were mossic; that the person they intend to attack is in a sound alumber, they generally alighe near the feet, where, while the creature continues faming with its enormous wings, which keeps one cool, he bites a piece out of the tip of the great toe, so very small, indeed, that the continues for a principal parts of a Roman bath were—the kype-brad of a pin could scarcely be received into the wound, which is censequently not painful; yet knowing the principal parts of a Roman bath were—the kype-brad of a pin could scarcely be received into the wound, which is censequently not painful; yet knowing the principal parts of a Roman bath were—the kype-brad of a pin could scarcely be received into the wound.

The principal parts of these baths; "but the while both the walls increased by a portico. The main building obtained in the wound, of the principal parts of a Roman bath were—the kype-brad of a pin could scarcely be received into the wound.

above another; co immediately over the over the first, m second. From be obtained res the name given to the room for undrawing in, and it was also a place for desiding and conversation. The terms frigideries, theiderens, and colduction were likewest applied to the bathing apartments in which the cold, lepth, and not baths were placed. These hathing rooms had in theocastre of each, a large marble hasin, with cold, taped, or hot water. The colduction had helder wells, and the floor sected on low plines over the hypercessistics; so that it was surrounded on all sides with heated air. At one end of this apartment, which was is unally twice as long as it was wide, was the locolices, where a vase for washing the hands and fare was placed, called laram; and at the other end was the hot bath, called lararrum. Round the walls of the bathing-rooms were seats or benches, which, in the colductum, were reject one above another. the name given to the ping in, and it which, in the coldarium, were raised one above another, as in an amphilibratic, in order to give the bathers a choice of temperature, from the higher, of the upper part of the room, to the more moderate lower down. The medicarium, or electricism, was an apartment containing outments of various kinds for anonting the body. The usual time of bathing with the Romans was about two o'click in summer, and three is winter. Their mode of bathing was as follows: — After undressing, the body of the bather was anointed with a cheap coarse oil; on which he proceeded into the spharisterium, a very large spartment, devoted to exercises of various kinds, the most common of which was the ball. After taking a sufficient amount of exercise, he went into the adjoining warm bath, where he weeked, and scraped the surface of his body with instruments called strigiles, usually of horn or brouze. His body was then anointed usually of norm or bronze. His body was then adomined with performed oils. He then passed into the tepidorium, and thence into the frigidarium, in order to soften the transition from the intense heat of the caldarium to the open air. Plates XIV, and XV, exhibit the plan after the measurements of the calebrated Palladio, of the baths of Caracalla; of the references in which the after the measurements of the celebrated Palladio, of the baths of Caracalla; of the references in which the following is an explanation. 1. The great square survounded by a persico for the exercises of the stadium. 2. These portions of the porticos which served as antrances to the vestibules of the palestra. 3. The cells schears, or hall of saadals, of the palestra. 18 gates of which were furnished with lattice-work of bronze. 4. Festibules of the great hall. 5. The great hall furnished with the xystum 6. Other vestibules belonging to the lateral spartments of the palestra. 7. Others narrower than those already mentioned, the wides of which were ornamented with base relieving the sides of which were ornamented with base relieving the state of the same state of the same purpose, formed in the side-walls. 16. Walls of the city, anterior to those of Aurelian, which were enlarged by Caracalla for the extension of the baths. 48. The fountains mentioned in fig. 38. 49. Porta. Capean in the city wall. 50. Ports Terentins. 51. The Ap Way. From the preceding detailed description it 51. The Appear be perceived that in these prodigious monuments of Roman magnificence were assembled all the institutions favourable to health, to all the exercises of the body, and to the amusements of the people. Upon Pisto XVI, is shown the representation of an ancient bath with all its appliances in full operation, as described by Montfaucon. Bustace, in his "Classical Tour," thus describes the celebrated public baths of Caracalla:— "At each end were two temples, one to Apsilo and another to Asculapius, as the tutelary deities of the place (genic tutelares), sacred to the improvement of the mind and the care of the body; the two other temples were dedicated to the two protesting divinities of ples were dedicated to the two protecting divinities of the Automin family, Hercules and Bacchus. In the principal buildings were, in the first place, a grand circular vestibule, with four halfs on each side, for cold, tepid, warm, and steam baths; in the centre was an immense square for exercise when the weather was un-favourable to it in the open air; beyond it a granthall, where 1,600 marble seats were placed for the con-venience of the bathers; as each and of shis hall were liberies. This building takening the cold of the conlibraries. This building terminated on both sides in a court surrounded with pertieos, with an oftense for music, and in the middle asysticute basin for swim-ming. Round this edifice wore swites shaded by rows of trees, particularly the plane; and in its front exof trees, particularly the plane; and in its front ex-tended a gymussium for running, wrestling, &c., in fine weather. The whole was bounded by a vast portion-opening into excites, or specious halls, where the poets declaimed, and philosophers gave lectures to their auditors. This immense fabric was adorned within and without with pillars, stucco-work, paintings and statues. The stucco and paintings are yet in many places perceptible. Pillars have been dug up, and some stall remain amidst the ruins, while the Farnesian some still remain amidst the rains, while the Farmenan buil and the famous Hercules, found in one of these halls, amounce the multiplicity and beauty of the statues which once adorned the Therms (baths) of Caracalla." The well-known marble group of Laccoon was found in the baths of Titts in 1806. The Tarkish bath of the present day is essentially that of the ancient Romans. The Himans, or Turkish bath an it arists in Constantinguis is described. Turkish bath, as it exists in Coustantinopie, is described by Dr. W.J. Erssmus Wilson, in his work entitled "The Bastern or Turkish Bath." It is a large building, with a domed roof, a square massive body, from which minsdomed roof, a square massive body, from which minariouse by furnices. 17. Chambers or haths belonging

In Lit to denote an unconcences descent from the subline to the ridiculous from a lotty idea to a mean one; as in the well known lines-

"And thou, Dilhousis, the great god of war Lieutenant general to the earl of Mar"

Lattenant general to the earl of Kar"

Bath Lot lath ki! (Heb, daughter of the voice), the tame given to a species of oracle employed by the Jews, and it quently mentioned in the Talmind. After the death of Milacin, the spirit of prophery ceased among the Jews and they then had recourse to another kind of revelation, called the daughter of the voice, because it succeeded the oracing prophery. It was, in fact a method of divination similar to the Sories Vergliams of the Romans. As, in the latter case the irret words they happened to dipints in the works of that poet were regarded as a kind of exacts, whereby they predicted future events, as with the Jews, when they appealed to Bath-Kol, the first words they head from any one a mouth were looked upon as a voice from heaven, directing them in the master they a voice from heaven, directing them in the master they inquired about Lyen Christians in former times were not free from this supersettion, often making the same use of the bouptures that the Romans did of the works

use of the boriptures that the Romans did of this works of the Mantuan bard
Barus and Wash houses—In the early part of the pissent century the want of proper accommodation in the houses of the poorer classes in large towns and cities for washing clothes and the person, which is so very needful, and eminently conducave to beatth, led many benevolent individuals, of a practical surfact of mind, interested in what is now bettined "social surface," to consider what should be done to remedy the evil. Remembering, doubtless, the public baths, which were deemed the most necessary and important restitutions in Rome and the cities of her interesting dependent provinces, remains of which are to be seen

working classes with the means of chasining a not or cold bath, as well as the me of washing-approprint, for cleaning, drying, and moning lines in a comparatively short period of time. Since sentering the disconfort and unbeasiby designees which must always exist in the dwelling of the arisess, often limited to one or two rooms in a building, or safer berrack, occupied by many families, on days appropriated to the abcessary but most disagreedable process of washing. In 1844 the first practical steps were taken to initiate the movement, and, at a meeting held at the Mansion House, a sensety was formed, under the name of the "Association for Promoting Cleaniness among the same and the same of Mr. Bowe, a surgeou, who was mainly instrumental in bruging about a result of desirable, will always be knoourably connected. Subscriptions having been raised for the purpose, an old suit so desirable, will always be honourably connected. Subscriptions having been raised for the purpose, an old house in Kilasshouse Yard, Upper East Smithfield, near the Lounion Docks, was taken and opened in the following reas, amply furnished with baths, coppers, and the necessary appliances for bathing and washing, where bathers and washers were admitted without charge; and that the boon was fully appreciated by those who lived in the immediate neighbourhood, may be gathered from the fact, that during the first year 64,319 persons awailed themselves of the privileges offered by the association. The society, in 1846, proceeded to exect medel premises in Goulston Street, Whittschapet, the general principles of which, as re-Whitechapet, the general principles of which, as re-gards construction and arrangement, have been closely followed in all other similar institutions. In the same rear snother company erected and opened an establishment in George Street, Euston Square; and an act was introduced and passed (which was amended in 1827), by which, with the consent of the inhabitants, parochial vestries, and town-councils of corporate and belongly towns, were empowered to build public baths and wash-houses, borrowing money for the purpose, to be refunded by payments to be made out of the borrowing or poor-rate. The charges were fixed at 1d. for a cold bath and 2d. for a hot one; and the use of the washing apparatus at not more than 3d. per hour. the washing apparatus at not more than 3a, per nour. The prices for baths of a higher class were not to exceed three times the sum charged for the lower class. Many parishes in London promptly availed themselves of the advantages offered under this act; that of St. Martin-in-the-Fields being the first to do that of St. Martin-in-the-Fields being the first to do so. This example was quickly followed in Liverpool, Manchester, Bristol, Birmingham, and many of the more important towns in the United Kingdom; and shortly after the closing of the Great Exhibition in 1851, the governments of France, Sweden, and Belgium, and the municipal anthorities of many continuits, as well as New York, having seen the benefits resulting from such establishments in England, and the information on the practical varying of the applied for information on the practical working of the scheme, and statistics connected with it, with a view to the erection of similar institutions in their own capitals and towns. There are about twenty of these capitals and passes in London, and about 2.000 000 hathers and \$500.000 washers take advantage 10,000 bathers and 500,000 washers take advantage of the accuramodation offered in these, at an average cost of rather more than 3d. each. With the exception of the institution in Goulaton Street, which commenced operations hampered by a heavy debt, the baths and expenses, or nearly so; and there can be no doubt that all will become fully self-supporting in the course of a few years. It has been found that persons belanging to the middle classes avail themselves of the convaniences offered by the wash-houses to a much preser extent than the poor, for whose benefit these preser extent than the poor, for whose benefit these contablishments were intended; which is to be regratted, as the primary end simed at by the original promoters of the movement thereby falls short of attainment; it shought, however, that funds might be produced by affording better accommodation; and obarging higher rates, for those who are possessed of better means, which would enable the managers to open a third class. which would enable the managers to open a third class for the scorest people gratuitously, or at a nominal struct. In the classes. The following is a general description of the Rhine at Graticianal Paintes in these establishments. The baths of both cissess are placed in a large open room, rescribing a shad, lighted from openings in the roof and abound in a compling a shad, lighted from openings in the roof and objects these for man are placed on one side of Bombay.

g, and those for women on the other. partition, generally of these about 10 feet high; the best, which is for the most pure made of size or trong, and holds from 50 to 60 gallons, being in some eases and helow the level of the flow, and in others above in Hot or cold water can be supplied by an attendant, as the bather may order, by means of a contrivance placed in each room for the purpose of allowing him to make his requirements known. Two towels are generally allowed for a first-class bath, the charge for which is 64, hot and 3d, cold; and one for a bath of the second class, which may be had for 56, hot and 56, cold. Soap may be purchased of the attendants who aupfly the towels. At some of these satallishments shower and vapour baths are to be found, as well as auggly the towels. At some of these establishments shower and vapour baths are to be found, as well as large swimming baths filled with topid and ould water. The washing-rooms are similar in construction to those containing the baths, being divided into fower of compartments resembling stalls in a stable, each being shout 8 feet long by 33 wide, by also partitions about 8 feet bigh. Each division contains a wooden trough, to serve as a boiler, and a washing-tub, which are supplied with hot or cold water, or emptied, by taps arranged for the purpose: steam is admitted into the mooden botter whenever it is desired to make the water boil. The bottom of the compartment is covered with a wooden The steam arising rack, on which the washer stands. The steam arising from the ranges of boxes is carried off to a ventilatingshaft. The clothes are dried in a wringing machine made of galvanized wire, to which a rapid rotatory motion is imparted by turning a handle, the water being driven out by centrifugal force. After being wrang, the clothes are taken to a room called the drying chamber, also divided into compartments and heated with hot air : each compartment is farnished with a horse, on which the linen is hung: it is generally quite dry in about a quarter of an hour. Some institutions have a room provided with hoards covered with finnel, irons, and stoves, for ironing. Soap and sode must be provided at the expense of the washers. The use of the apparatus in wash-houses having first-class compartments furnished with a rinsing-table and class compartments furnished with a rinsing same sub-being rather larger in size, is 23d, per hour first class, and 13d, second class; the general charge is, however, 13d, per hour, sithough, in some places, id. only is charged. It is found that two or three hours are sufficient to enable a good washer to wash and dry the whole of the linea used in a small family .- Ref. Euglish Cyclopadia-Arts and Sciences.

BATH STONE. (See COLITE.)
BATIDER, but-i'-de-e, in Bot., the Batis ord. A single succulent and surubby plant, Batis maritima, constitutes this supposed distinct order. It is a native of the West Indies, where it is occasionally used as an ingredient in pickles. The order is closely allied to Empsteration the Crowberries.

BATMAN, baw'-man, in Mil., a soldier who has been told off to perform certain duties which are not the ordinary regimental duties. For instance, when troops are in the field, each field-officer has a batman; the staff have one likewise, and avery company has two These batmen take charge of the horses for carrying the camp equipage. Neither batmen nor bat horses are allowed to troops while on duty in the United King iom.

BATON, ba-tawn(y), (Fr., a staff), is a staff or emb employed to denote dignity or power. If is the name given to the short staff presented by the French sove-reign to each field-marshal on his appointment, so we

indication of his power.

BATRACHIA, Là-trai-ki-a, soft and naked-skinned rep tiles, such as frogs and toads, who in the carly stage of existence respire by means of gills.

existence respire by means of gills.

BARACHO LITES, bai-trai'-ko-lites (Gr. bat-codies, a frog, lithos, stone), in Geol., fessil remains of frogs and other animals of the same order. The striptomy restiges of the soft parts, and imprints of the festiol several genera of true batrachians, occur in the territor structs. In the pincone deposits on the banks of the Rhine at Enringen, and in the paper-soal of the Edds, several species of frog, tond, and next have been found. Fossil fregs of a small species very similar to the recent abound in a dark shale overlaid by basalt, in the whomity of Bombay.

## Batrachomyomachia

BATRACH(MYONACHIA, bill-ra-ko'-mi-o-maf-ki-a (Gr. butraches, a frog; mas, a mouse; mache, a battle), literally signifies a battle of frogs and mice, and is the title of a Greek mock berois posm usually sacribed to Homer, but without any good foundation. It seems to be indeed a parody upon the Hiad; and the contests of the beasts, their single combats, the intervention of the gods, and other Homerio incidents, are described with much humour.

BATRACHUS. (See FROG-FISH.)

(£60) per month; a major's full batta was 456 rupees a captain's, 182; lieutenant's, 122; ensign's, 92. When a captain s, 122; heutenant s, 122; casign s, 12. When a regiment was in garrison or cantonnents within 200 miles of the seat of government, of either of the stree presidencies, only half-batta was allowed the with an addition for house-rent. The effect of the amalgamation of the East-India and royal regiments has been to cause an entire alteration in the system of batta allowances.

BATTALION, but-tall-you (Fr. bataillon), in Mil., is a division of the infantry in an army, commanded by a colonel. Two or more battakions (frequently only one) colonel. Two or more battakons (frequently only one) constitute a regiment; two or more regiments, a brigade; two or more brigades, a division; two or more divisions, a corps d'armée; and two or more corps d'armée, a grand army. A division corresponding to a battalion exists in most of the armies of Europe. The object in a battalion is not to make it too small, and yet not to make it larger than that all the men of it can hear the voice of the commander. The number is resulted from 600 to 1000 man. The Pression and is usually from 600 to 1,000 men. The Prussian and Austrian battalions are, on the war footing, each 1,000 strong, and are in the former divided into four, in the latter into six companies. In the British army a the latter into all companies. In the British army is battalion usually consists of about 750 men; and, in most cases, one battalion constitutes a regiment. During war, however, the British army is increased, not by adding to the inumber of regiments, but by adding battalions to a regiment, and companies to a battalion is groundly divided into the adding battainous to a regiment, and companies to a battailon. A battailon is generally divided into ten companies, each company into two equal parts, and cach of these into sections. The company of grena-diers occupies the extreme right, and the light-infantry company the extreme left of the battailon, while the

other eight companies, each designated by a number, one drawn up between them.

BRITHIN, bill-less, in Mar., signify thin pieces of oak or fir nailed to the mastheads and to the midship part of the yards. Battens of the hatches are a sort of long narrow laths, scantlings of wooden stuff, or straightened hoops of casks. They serve, by the help of nating, to confine the edges of the tarpauling close down to the sides of the hatchways, to prevent the water from penetrating the lower apartments of a ship during a

storm.

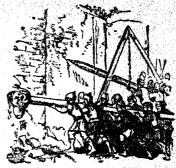

BATTENS.—In Carpentry, this term is applied to pieces of fir-wood about 14 or 16 feet long, not more than 7 inches wide, and 22 inches thick. They are used for making floors, and when off into six lengths they are used as uprights on which to usil laths, where plastering is required. The best battens come from Christiana, in Norway, and an inferior kind is imported from North America.

BATTENING-RAM, bat-ter-ing, a military engine of high antiquity, which wes used for beating down the walls of besieged fortresses. It consisted of a massive beam of timber, with an iron or bronze mass upon one and, generally of the abspe of a ram's head. In its earliest and rudest form it was worked by soldiers, who supported it in their hands. More generally, however,

supported it in their hands. More generally, however, supported it in their names. More generally, however, it was along from a cross-beam, with an alternate extensive surface of coated glass is required. Such a motion communicated to it by means of ropes. It was a tensive surface of coated glass is required. Such a surface may be afforded by one huge jar or by a battery, in many cases covered by a rude form of shed, which served as a protection to those working the ram. Justus are incoavanient and expensive. A battery is formed Lipsius speaks of one battering-ram as 180 feet in by joining together all the charging-rods or inner

# Battery, Electrical

length, a diameter of nearly 23 feet, while the iron head weighed a ton and a half. Supposing this engine to be worked by 100 soldiers, it would acquire a momentum equal to that of a 35-pounder. This very ancient weapon of destruction is mentioned by Ezekiel. Thucydides speaks of it as being used in the Polopon-

BATTEBING-RAM.

nesian war, n.c. 429; and Dionysius the Elder certainly employed it a hundred years later at the siege of Motys. The Romans, who derived it from the Greeks, used it

The Romans, who derived it from the Greeks, used it constantly and with great effect. It was sometimes, but not very frequently, used in the Middle Ages.

BATTERY, batt-te-re (Fr. batterie), in Mil., a number of pieces of ordnance mounted upou a raised platform behind an elevation of earth. A battery of this sort is principally used in order to defend or retain a position. There are, however, many kinds of batteries, distinguished by names, referring either to their podistinguished by names, referring eliber to their po-sition or the duties which they are required to perform. In gun and howitzer batteries, there are embrasures through which the firing takes place; but mortar-bat-teries have no openings. In field operations, a battery teries have no openings. In need operations, obstery mostly consists of six pieces of ordnance, with gumers, horses, ammunition, &c., complete. A battery of footartillery is usually called a field-battery, in order to distinguish it from that of the horse-artillery, which is called a horse-battlery. A field-hattery offen decides a battle. At the battles of Alma and Inkermann, the former was decided when the British troops reached the Russian batteries; and the successful retention of a sand-bag-battery at Inkermann ultimately left the victory with the allied troops.

victory with the allied troops.

BATTERY, in Law. (See ASSAULT.)

BATTERY, ELECTRICAL.—The term usually applied to a combination of several electrical jars, which may be charged and discharged as one great jar. The construction of the simple jar, or Leyden phial, will be fully explained further on (see JAR, ELECTRICAL), but a short description of this important instrument may be given here. It complete of a wide months is a \*\* short description of this important instrument may be given here. It consists of a wide-mouthed jar of thin glass, coated externally and internally with tinfoil to within a few inches of the top, and provided with a wooden cover, through which passes a stout wire connected with the inner coating, and terminating above in a brass knob or ball. Such a jar is charged by connecting the outer coating with the earth, and bringing the knob in contact with the conductor of an electrical machine. To discharge the jar, its necessary to complete a conducting communication between the exterior coating and the knob. The extent of such communication, which is termed an electrical circuit, exterior coating and the knob. The extent of such communication, which is termed an electrical circuit, may be almost indefinite. If the discharge be effected through a short circuit of bent wire, terminating in brass balls, there occurs an exceedingly bright spark, accompanied by a loud snap. If a pertion of the living frame be included in the circuit, then a powerful shock ensues, the intensity of which depends on the amount of the charge. To obtain very powerful effects, an extensive surface of coated glass is required. Such a surface may be afforded by one huge jar or by a battery. Very large area are, however, seldom simployed, as they

# Battery, Floating

coatings of several jars, which are then united externally by being placed on a common conducting-base. When charged from the conductor of the machine, and discharged in the nural way, these jars all set together in mass; hence we have a means of multiplying electrical accumulation to an almost undimined degree, provided we can obtain a sufficient charging power. With a battery of 100 jars, each about 18 inches in diameter, 2 feet high, and exposing altogether about 550 square feet of coated glass, the Dutch electrician Van Marum obtained a tremendous action: when this battery, after tarring been fully charged by a vary large double-plate obtained a tremendous action: when this battery, size that high been fully charged by a very large double-plate reachine, was discharged through and upon various kinds of matter, its force was irrestable. Steel bars, bin. in length, a inch wide, and A th inch thick, included in the circuit, became powerfully magnetic; a piece of boxwood 4 inches aquare was rent in pieces; various metallic substances were melted and dispersed in all directions, an iron wire, 25 feet in length, and about metaline substances were metted and dispersed in an dispersed in an dispersed in an dispersed in length, and about the 1-th part of an inch in diameter, fell, under the slock, into red-hot belle; a piece of tin wire, 8 inches long and 1-th of an inch in diameter, disappeared in a cloud of blue smake, from which fell red-hot globules of the metal. The electrical battery, as sold by the philosophical-instrument makers, is a compact and elegant apparatus. It consists of a number of small elegant apparatus: It consists to a number of smain jars, each occupying a separate compartment, in a strong wooden case lined throughout with tinfoil, all the jars being connected by cross brass rods terminating in balls. Sir W. Snow Harris recommends a much more simple arrangement, in which jars of comparatively large dimensions are employed. Five, seven, or any other convexient number of the jars, are arranged in a group upon a circular conducting base, and the knobs of the external jars are connected with the charging rod of the central jar by short brass wires. If very great power is required, a number of such groups may be united by joining their central jars. The management of electrical batteries requires very great caution. The jars are easily charged by connecting the central rod with the machine, as the charge will then pervade the whole series through the connecting-wires. ingenious contrivances are employed for discharging electrical batteries without danger to the operator. The best of these consists of two insulated balls, one in communication with the inner coatings, and the other with the common conducting base, which balls can be brought in contact at any instant, by touching a glass handle placed at a safe distance from the charged jars. When certain substances are exposed to the action of When certain substances are exposed to the action of the battery, they are placed on an insulating-table between two directing wires, which may be adjusted conveniently for the particular experiment. The in-strument termed the universal discharger is generally employed in such operations. In this, the two directing-rods, slide through short spring tubes supported by glass pillars, with which they are connected by movable joints; the insulating-table is placed between these rods, and is supported by a glass leg, which fits into a socket of compressed cork, in such a way that the table may

or compressed core, in such a way that the time may be maintained at any required height.—Ref. Eudimentary Electricity, by Sir W. Snow Harris.

BATTERY, FOOTING. (See FLOATING BATTERY.)

BATTERY, VOLTAIC OF GALVANIC, an arrangement for producing a current of electricity by chemical action. The two forces electricity and chemical affinity are so intimately connected, that one may be assumed to be either the cause or the effect of the other. The chemical effects which result from the passage of electricity through different substances will be con-sidered under the head of ELECTROLYSIS; and the the head of Biscratchery, Volkaro. In explaining the head of Biscratchery, Volkaro. In explaining the principles of the voltate battery, it will, however, the principles of the voltate battery, it will, however, the principles of the voltate battery, it will, however, the principles of the voltate battery, it will, however, the principles of the voltate battery, as well as the principles of the voltate battery, as well as the principles of the two forces. It is piece of zinc of a number of simple pairs similar to that described a slove, and the two be then plunged in a vessel containing water excludibated with sulphuric soid, the whole arrangement will constitute a simple circuit, or voltate part, in action. The action is dependent on the different chemical efficity of the liquid for the respective with the zinc of the second, the copper of the second metals. It will attack the sinc rather than the copper; with the zinc of the third, and so or to the sale of the plates, by useans of a wire or otherwise, electrical phenomena attending chemical changes, under the head of Electricity, Voltaic. In explaining the principles of the voltaic battery, it will, however,

# Battery, Voltaio

may be considered to commence at the surface of the zinc, or active stances, to be projected through the cliquid to the conject, or another stances, and thence back again by the conducting-wise. Fourtre electricity is assumed, for the sake all simplicity, to be the electricity, and, in common parlance, it is said that the slootic current of every battery in action status from the metal attacked, passes through the liquid to the second metal, or conducting body, and returns by the wire or other channel of communication. It must not be forgotten, however, that a current of negative electricity takes place at the same time in an opposite direction. It is necessary, moseover, to guard against the idea which the term current naturally suggests, or an actual bodily transfer of something through the substance of the conductors, like water through a pipe. The real nature of the phonomena of the voitaic circuit is entirely unknown, and may, penhaps, remain so; still such expressions as electric current, passing so; still such expressions as electric current, passage so; still such expressions as steerie current, passing of electricity, &c., are so convenient, that it would be foolish to reject them; and so long as they are used strictly in a ligarative sense, they are unobjectionable. In every voltaic combination, the passage of the electricity (i.e. the positive modification of the force) in the liquid is from the active element to the inactive the tiguid is from the active element to the inactive element: in the simple circuit above described, for instance, it is from the zinc to the copper. If this simple fact be borne in mind, it will decide in every case the question which confuses so many; namely, which is the positive and which is the negative end of a battery? The positive is the end where the electricity leaves the battery; the negative where it re-enters it. The direction taken by the current being ascertained by the mere inspection of the relative situations of the two elements in a cell, the other points follow as a necessary consequence. Thus, if the wire connecting necessary consequence. Thus, if the wire connecting the copper and zine of the single pair be broken, and the circuit completed by interposing some apparatus between the broken ends, an examination of the arrangement will at once show that as the electricity arrangement will at once show that as the electricity passes from the zinc to the copper, it will leave the battery by the wire attached to the copper, and, passing through the interposed apparatus, will return to the battery by the wire attached to the sine: the copper, therefore, forms the positive end, and the zinc the negative end. The current produced by a simple circuit is too feeble to produce any strking effects; but by arranging a number of pairs in a connected series, in such a manner that the direction of the current shall be the same in each the intensity the current shall be the same in each, the intensity may be greatly excited. The two instruments invented by Volta, called respectively the pile and crosse of espe, depend on this principle. The voltaic pile is never employed now; but as it was the first battery constructed, it may be described here. Upon a plate of zinc is laid a piece of cloth rather smaller than itself. steeped in dilute acid, or other liquid capable of acting chemically on the zine; upon this is placed a plate of copper, silver, or platinum; then another piece of sine, another cloth, and another plate of inactive metal, until a pile of about twenty alternations has been built up. If the two terminal plates of such a pile be touched with wet hands, the sensation of the electric shock will be experienced; but, unlike the momentary effect produced by the discharge of au electrical jar, the produced by the discharge of an electrical for, the sensation will be prolonged and continuous; and, with a pile of one handred pairs, excited by dilute acid, it will be nearly insupportable. When an extensive pile is insulated, the two extremities will be respectively found in strong positive and negative conditions; and, when convenient in what because the conditions; and, when connection is made between them by wires, armed with points of coke or hard charcoal, discharge

discharge takes place as in the case of the pile. The principle of the compound battery is well seen in this arrangement. By such alternation of sine fluid and copper, the current is urged forwards with increased energy; but, though its inferently is augmented, the actual generity of electrical force, as estimated by the decomposing power of the current, is not increased. The difference between intensity and grantity can only be touched upon here, but will be fully, explained in the article on voltaic electricity. The intensity of a current of electricity, which is increased by multiplying the alternations, is its power of overcoming obsticles and passing through imperfect conductors. The quantity of electricity generated by any battery is measured by the chemical effects it is capable of producing, and is never greater than that developed by the smallest and least active pair of plates. In the crown of cups, the beautiful regularity of action common to all batteries may be observed. Whatever the number of cells, precisely the same amount of action number of cells, precisely the same amount of action occurs in each. The same weight of zine is dissolved occurs in each. The same weight of zinc is unsource in the same time in every cell; and the strength of the electrical current in one part of the cironit is invariably equal to that in any other part. If the zinc forming the active elements be perfectly pure or amalgamated, and have no action muon it while the circuit the dilute seid has no action upon it while the circuit remains broken; but the moment the connection is completed, torrents of hydrogen gas arise from the surface of the copper, while the zinc undergoes oxida-tion and solution. Common zinc is very readily dis-solved by dilute sulphuric acid, owing to the formation of a multitude of little voltaic circles, by the aid of particles of foreign metals, or plumbago, partially embedded in the zinc. This gives rise in a battery to what is called local action, by which much of the metal is often consumed, without contributing in the least to the general electrical effect. This evil may be got rid of by amalgamating the surface. To amulgamate zine place it is merely necessary to place them in a dish containing dilute sulphuric seid, and rub them with a rag, at the same time allowing a few drops of mercury to fall on them. The rubbing will cause the mercury to spread; and it may in this manner be made to entirely cover the whole surface of the plates. They should then be rinsed with clear water, and put uside in a vertical position to allow the excess of mercury to By this means the surface of the zine acquires a beautiful frosted appearance, and local action is prevented. Zinc, either amalgamated or pure, is almost invariably used for the active element in voltaic arrangements; and opposed to it, as the inactive ele-ment, we generally find one of the four metals, copper, platinum, silver, and iron, or the non-metallic sub-stance carbon. Of the many different forms of battery platinum, silver, and fron, or the incurrence stance carbon. Of the many different forms of battery devised since Volts's time, the most noteworthy are those of Cruikshank, Wollaston, Daniell, Grove, Bunsen, Callan, and Smee, which will now be separately described

Cruikshank's Battery.—The apparatus invented by Mr. Cruikshank is a convenient modification of Volta's Mr. Cruikshank is a convenient modification of Volta's originat pile. The zinc and copper plates, instead of being laid one upon the other, are soldered together in pairs, and placed in vertical grooves cut in the sides of a malogany trough lined with pitch. Each pair is firmly secured in its groove by cement; and tha whole trough is thus divided into a series of water-tight cells or compartments, capable of receiving the exciting liquid, which may be dilute sulphuric soid or a solution of commands.

or common salt.

of common salt.

Wollaston's Battery.—In this arrangement every copper plate is doubled round a zinc plate, and the two metals are kept apart by pieces of cork or wood; consequently, both surfaces of the zinc are exposed to the action of the liquid, which is contained in an earthenware trough, divided by partitions into as many cells as there are pairs. The zinc of one pair is connected with the copper of the next; and all the pairs are firmly strached to a bar of dry mabogany, so that they can be readily lifted out or plunged into the acid. The great objection to this battery, and to the other contrivances previously described, is the rapid decrease of power. The current, however strong at first, soon becomes west, and, after a certain time, is hardly perceptible. This loss of power may be easily explained. In the first place, the exciting

ford, sulphuric soid, is gradually changed to sulphure of sinc, which has no action on the zinc;—scotsidly, bubbles of hydrogen adhere to the copper, and, of necessity, prevent portions of the metal from being in sound contact with the liquid;—thirdly, the dissolved sinc is partially precipitated in a metallic state on the copper, and thus gives rise to counter currents.

Daniell's Battery.—The first constant battery,—that is to say, an arrangement capable of maintaining a remain current for many hours,—was devised by Pro-

regular current for many hours,—was devised by Pro-fessor Daniell. Each cell of this battery consists of a copper cylinder, 33 inches in diameter, and of a height varying from 6 to 18 inches. In this copper cell, which forms the inactive element, is placed a cell of porous carthenware; and in this is suspended the active element, which consists of a rod of sine 2 of an inch in ment, which consists of a rod of sine # of an inch, in diameter, carefully amalgamated. The porous cell, when moist, offers little resistance to the passage of the electrical current, but effectually prevents the de-position of zinc upon the copper. It is filled with a mixture of one part, by measure, of sulphuric acid, and eight of water; while the exterior space is filled with the same liquid enturated with sulphate of copper. A little perforated shelf or colunder is fitted to upper part of the outer cell, and on this crystals of upper part of the outer cell, and on this crystals of sulphate of copper are placed, so that the strength of the splution may be kept up. The copper cylinder and zinc rod are provided with binding screws; said, when a communication is made between them by wices, a current is produced, the intensity of which may be augmented to say degree by connecting a sufficient number of cells, on the principle of the crown of oups, the copper of the first being statched to the zinc of the second. Ten such cells constitute a very powerful apparatus, which has the great advantage of retaining apparatus, which has the great advantage of retaining its energy for a lengthened period. When the circuit is incomplete, the dilute acid exerts no action on the zinc; but, directly the opposite poles are connected, action commences. The zinc is slowly dissolved, white at the same time metallic copper is deposited on the at the same time metallic copper is deposited on the surface of the copper forming the outer cells; and as long as the solution of sulphate of copper remains saturated, there is no evolution of hydrogen. By this admirable arrangement the principal defects of the ordinary zine and copper battery are removed; for, in the place of hydrogen and metallic zine, pure copper is alone deposited on the inner surface of the

copper cell.

Grove's Battery.—In this, the most powerful of all voltaic arrangements, platinum is used for the inactive element, and the evolution of hydrogen at its surface element, and the evolution of hydrogen at its surface is provented by the oxidizing action of uitric acid. A single cell of Grove's battery consists of a vessel of stoneware, within which a cylinder of amalgamated zine is placed; and this surrounds a porous cell containing a slip of platinum-foil. To excite the battery, strong nitric acid is put into the porous cell, and dilute sulphuric acid into the outer vessel. With a series of ten or twelve cells, the electric light between charcond points may be exhibited with great brilliancy. When the platinum slips are only 2½ inches long by 1 inch broad, and the zincs 4 inches high by 2½ in diameter, four cells decompose water rupidly, and give a current four cells decompose water rapidly, and give a current of sufficient power to heat a fine platinum wire to redness. The battery is very compact and portable, and to a great extent constant in its action. The zinc. as in the case of Daniell's battery, is only consumed while the current passes; so that the apparatus may be arranged an hour or two before it is required for nee. The nitric acid suppresses the whole of the hydrogen, becoming thereby slowly deoxidized and converted into nitrous acid, which at first remains dissolved, but after a while begins to be disengaged from the porous cells in dense red times. This constitutes the only serious drawback to Mr. Grove's

excellent apparatus.

Bunsen's Battery.—This form of battery, which is much used on the continent, resembles that hat described, save that the inactive elements in contact with the nitrie acid are formed of carbon. They are made of various shapes, by heating in proper moulds a strongly-compressed mass formed from a mixture of powdered coke and caking coal, rendered plastic by

strong syrup.

Callan's Maynooth Battery.—This is another modifi-

cation of Grove's battery, in which cast-iron is substi-tuted for platinum. The most brilliant effects may be produced by means of a large sumber of sinc and iron pairs; and the cheapness of both metals renders such a battery accessible to those who cannot afford to invest

much money in platinum plates.

Sizes's Bottery.—For most practical purposes this apparatus may be advantageously used. It is less apparatus may be advantageously used. It is less powerful than most of the arrangements already described, and, in constancy it is decidely inferior to Daniell's battery; but the ease with which it can be constructed and repaired, the fact of its only requiring one exciting liquid, and never evolving any unpleasant or oppositive wapour, render it a most valuable and convenient instrument. Each cell contains three plates, two of active and one of inactive metal. The two active plates are of amalgamated zine, and are tightly clamped to a wooden frame by a screw, which, being of brass, survey to connect them electrically. The inactive plate is a thin sheet of platinized silver, and is held in the frame between the two zincs. Before platinizing the silver, its surface is roughened by a momentary immersilver, its surface is roughened by a momentary immer-sion in nitric soid, or by placing it between two pieces of sand-paper, and subjecting the whole to pressure. The silver thus prepared is then attached to a wire connected with a plate of zinc in a porous cell, and immersed in an outer cell which contains dilute sulphuric acid mixed with a weak solution of chloride of platinum. By pouring weak sulphuric acid into the porous cell, an electric current is produced, and finely-divided platinum is precipitated on the silver, just as copper is deposited in the electrotype process. (See Kleckstyre). The particles of platinum attached to the silver facilitate the liberation of hydrogen when the plate is used in the battery. Instead of adhering to the metal and interrupting the action, the gas escapes with a loud hissing noise. To excite the battery, a mixture of one part, by measure, of sulpluric acid, and twelve parts of water, is employed. This ingenious contrivance was appropriately named the chemico-mechanical battery by its inventor. (For a full account of the uses of the

BATTLE, bit-if (Fr. butaille), in Mil., is a hostile en-counter between two large bodies of troops or two armies. In early times a battle was a flerce tumultuous contest between bodies of men, without order or discipline, the issue of which depended upon the physical strengthor courage of the combatants. Gradually, however, the superiority of discipline, united effort, and the ase of improved implements of war as opposed to mero physical strength, began to be seen, and led to the changes that have since taken place in the training of armies and the conduct of engagements. The issue of a battle now depends upon a variety of circumstances, which renders it always a matter of difficulty to deter-mine beforehand what may be the result. These cir-cumstances are constantly changing; and sometimes events, that no human wisdom could have foreseen, may occur in the course of a battle to defeat the wisest plans and the most skilful arrangements. It is wisest plans and the most skilmi arrangements. It is
in force-seing and providing for the various circumstances of each particular case that the great skill of
a general consists; and though he may meet with
occasional reverses, in the long run, success is generally
on the side of him who forms his plans with the greatest
sagacity, and executes them with corresponding vigour
and ability. It is the skill of the general, rather than the courage of the soldier, that now determines the event of a battle. There is, perhaps, no position that calls for greater mental qualities than that of a general during a battle. With a consciousness of the

divided into three periods,—the disposition, the com-bat, and the decisive moment. The general first examines the strength, reconnoires the position, and endeavours to learn the intention of the enemy. He ought to know the nature of the enemy's ground, as well as his own; the atrong or weak points which it resents; by what local advantages his own finnits can be supported, or those of the enemy attacked; and also be acquainted with the weak points of his own and his antagonist's disposition; so that he may be prepared to strengthen the one or to assault the other. It forms part of the tactics of a good general to make the enemy conform to his plans, and to avoid the necessity of having to conform to the plans of the his opponent. If the enemy concest his position and plans, skirmishes and partial assaults are often advisable, in order to disturb him, to obtain a view of his movements. to induce him to advance, or make presents; by what local advantages his own flanks can of his movements, to induce him to advance, or make prisoners, from whom information may be obtained. presents; from whom internation has no chanted.

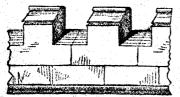

According to the knowledge thus acquired, and the state of the troops, the plan of the battle, or the disposition, is made. Dispositions ought to have for their object to insure at once solidity and mobility; and hence they ought neither to be too extended nor too deep. The plan of the battle itself, the position of the deep. The plan of the battle itself, the position of the troops, &c., is called the order of battle. When each division of troops has taken its position and received its orders, then comes the second period,—the combat. It commences either on several points, at a given signal, as is the case when the armies are very large, and a general attack is intended, or by skirmishes of the light troops, which is most commonly done. Before the battle the general relaxes bimself upon an alexance. the battle, the general places himself upon an eleva-tion from which he can see the coullict. The plans and orders of a general reach only to a certain point; the commanders of battalions must do the great work of the battle. They ought, therefore, to have as much knowledge of the business of the day as will enable them to vary their movements according to circumstances, when in such situations as that the commander himself cannot direct their operations. The commander-in-chief receives the reports of the generals under him, and gives orders from time to time; disposes of the troops not yet in action; strengthens weak points; throws his force upon the enemy where he sees him waver; or changes, if necessary, with a bold and ingenious thought, the whole order of battle. He sometimes sends one of his nides-de-comp to take instant command of the nearest body of cavalry, in order to execute an order which must be carried into effect quickly. The general also uses every means to bring on the third period,—the decisive moment. This cannot always be the result of calculation; it often takes place hauch sooner than was expected, and is often protracted by accidents or want of energy. Sometimes the operations are drawing to the end which the general simed at, when an unforescen accident suddenly gives a new impulse to the enemy. Everything depends upon a moment,-upon a thought; and the skill of the general is shown in the use he makes of the one, or the means he has at command for carrying out the other. Perhaps it is all-important to break at once the enemy's centre; to pour down cavalry in a certain direction, or to concentrate the fire of artillery upon a certain point. When the enemy begins to waver or retreat, it is of the utmost importance to follow up the victory with every possible vigour and dispatch. Of the numerous battles that have taken place there are a few that stand prominently out as having had a material effect on the world's subsequent systems a carring a cattle. With a consciousness of the great issues that depend upon him at that trying moment, smid scores of tremendous agitation and bloodshed, he must remain firm and collected, carefully observing the movements that are going on, ready to circumvent the intentions of the enemy, and to take advantage of any favourable circumstance that may present itself. Battles are either offensive on the cattle with its offensive on the content of course, a battle which is offensive on the content of course, a battle which is offensive on the content of course, and state which is offensive on the content of the Kleman legions under Yarus, A.D. 9; 6, the totatle of Chalons, 45; 7, that of Tours, 732; 8, that of Hastings, 1006; 9, Joan of Arc's victory over the Rigilant of astrong position, without snyother object than that of maintaining it against him. In offensive operations again, the enemy is sought for, harassed, and attacked on the first favourable opportunity. A battle is usually

#### Battle

Barras, or Barras.—Trial by a wager of battle,—a species of judicial combat formerly practised by individuals, and sanctioned by law in the Middle Ages. Any person accusing another of a crime was admitted to prove it by witnesses or by single combat. Although in England the right prevailed, it had fallen into desuctude; but it was unexpectedly revived in a celebrated case, which was the cause of its being shokished. In 1817 a young maid, Mary Ashford, was believed to have been violated and murdered by Abraham Thornton, who in an appeal claimed his right by his wager of battle, which the court allowed; but the appellant (the brother of the maid) refused the challenge, and the accused escaped, being ordered "to go without day," 16th April, 1818. The argument before the court of King's Bench occupied several days; and, as the case brought out a vast amount of research as to the history of duelling and judicial combat, and is well worthy the attention of the antiquary sud historian, we cannot do better than refer the reader to it. It will be found in 1 Barnewall & Alderson's Reports, K.B. 405. See also Chauncey's "Historical Antiquities of Hertfordshre," \*\*sib evel. Baldock, in 1nd. The statute 59 Geo. III. c. 46, abolished this right of appeal

BATTLE-AXE, bat'-tel-ax, an ancient military weapon of offence. This weapon, which appears to have been of offence. It is weapon, which appress to have been used from the most remote periods in warfare, was made in two forms. The first had a single edge only, and was similar to the modern hatchet; the second had two edges, and was sometimes called the Amszonian axo, from a supposition that weapons of this bind ware mad by the founds warrious. Axes were kind were used by the female warriors. much employed as offensive weapons by the Cultic and Scandinaviau nations. Among the Roman armies the battle-axe was not much used; it was considered the weapon of uncivilized nations. At the siege of the Roman Capitol by the Gauls, Brennus is represented as being armed with a battle-axe; and Ammianus Marcellinus, several centuries afterwards, describes an armed body of Gauls as being all furnished with battleaxes and swords. In the Bayeux tapestry the English are represented as using the buttle-axe. The pole-axe was introduced by the Normans; it had an edge on one side and a sharp point on the other. In the year 1415, at the battle of Agincourt, the Welsh infantry employed this weapon in order to dispatch those whom the archers had wounded with their arrows. torian Burns describes the Irish as being constantly armed with an axe. At the battle of Bannockburn, King Robert Bruce clove an English champion down to the chine at one blow with a battle-axe. The Beauto the chille at one ollow with a matter are. The fresh fettiers, or Beef-eaters as they are unigarly termed, were originally armed with this weapon. It was also used at an early period in naval warfare for the purpose of cutting the ropes and riggings of vessels. The battie-are fell into disuse towards the close of the 16th century.

BATTLEMENT, but-tel-ment, in Arch., a wall or parapet on the top of a building, with notches or indentures, in the form of embrasures, to look through or to disolarge missiles from, for the annoyance of an enemy. The rising parts of the parapet are called enerious or copes, and the open spaces are called creviels, loops, or embrasures. The purpose of the con-

DATTLEMENT.

trivance is, that a soldier may shelter himself behind the merion while he shoots or observes the enemy through the crenels. The derive is of great antiquity: it has been found represented in various forms in the bas-reliefs of Ninevel and Lycia, and in the Egyptian paintings, and exists in many remaining walls and

## Baxterians

towers of the Greeks and Romans, besides those of the mediaval period. Battlements were also largely gives to exclesisational and civil buildings in the Middle Ages by way of ornament, where they are often richly panelled or pierced with circles, trefoils, quatrefoils, dec. Out fortifications, the battlements are generally quite plain, or pierced only with a very narrow cruciform or upright opening, the ends of which sometimes terminate in, circles called asillets, through which archers could take aim. Sometimes the coping on the top of the appearance of a pierced parapet. The use of this ornament is almost entirely confined to the English styles of Gothic architecture.

BATTLE-PIECE, bill-tel-peece, in Paint, a picture which represents a battle, exhibiting large masses of mee in action. A painter of battle-pieces ought to have an accurate knowledge of the appearance of horses and amen, and, if possible, to have seen a battle. The armour of the anciente, and the whole array and action of their battles, afford subjects more favourable to the artist than the straight lines, condensed columns, and firearms of the moderns. Some of the greatest pieces of this kind are the battle of Constantine, of which the cartoons were drawn by Raphael, and which was executed by Giulio Romano; Lebrnu's battles of Alexander; and the battles of the Amazons by Rabens. From these may be distinguished the skirmishes, surprises, &c., which have been represented with so much skill by Antonio Tempesta, John Snellink, Jos., van der Velde, John Asselva, Peter Sneyders, Robert von Hock, Palcone, called oracolo delle battaglie, Horace Vernet, Edwin Landseer, and Others.

Bartur, hill-too (Fr. battre, to beat), an expression

BATTIE, bill-too (Fr. buttre, to beat), an expression used to denote an unsportsmanlike method, adopted by owners of large extates in the autumn and whiter months, of killing a great quantity of game which has been preserved for the purpose. The wholesale slaughter is unaccompanied by any exhibition of the skill that may be shown, or endurance of fatigue that must be encountered, in the pursuit of game in a fair and legitimate way. A party of ten or a dozen gentlemen, each with two gams, which are loaded for them by attendant keepers, surround a copse or plantation in which a great number of phessauis, bares, and rabbits are known to harbour. Men armed with long sticks are then sent in, who beat the bushes in all directions, which causes the game to quit their retreat and make for other covers. As they come out into the open space, they are shot down in all directions as fast as the guns can be discharged. Sometimes the owner of the estate derives a considerable annual sum from the sale of the game shot at these periodical battues.

BAUHINIA, baw-hint-i-a (so named by Plumier, in honour of the brothers Baulin, botanists of the 10th century), in Bot., a gen. of plants belonging to the nat. ord. Leguminose, sub-ord. Casalpinies. The species are natives of the warmer regions of both hemispheres. Most of them are twining plants, which stretch from tree to tree in tropical forests, like living cables; but a few are small trees, with erect self-sustaining stems. The leaves are generally divided into two equal lobes, which circumstance is said to have suggested the idea of naming the genus after the two brothers. The flowers of some are large and very beautiful; but they rurely show themselves in the bethouse. The genus contains several very useful species. Thus B. paroilore, racemosa, and validit yield tough fibres employed for making ropes; B. retusz and emarginatu each produce a kind of gum; B. variegata has an astringent bark used in medicine, and for tanning and dyeing leather; the buds and dried flowers of B. tomentosa are also astringent, and are much employed by the Indian doctors in dysenteric affections. The snaken rod of Æsculapius is said to have had its origin in a portion of the stem of A. scanders, which had twined around a smaller stem. The Mopané-tree of South Africa is a species of Baukinia. During the heat of the day the leaves of this tree fold up and become almost erect, so as to afford but little shade to the sun-oppressed traveller.

BATERIANS, burde-vi-ins, in Eccl. Hist., is a term applied to those who adopted the peculiar theological tenets of Richard Baxter. His system was liberal and conciliatory. He attempted to unite the different accts

## Bay

and parties in the Church by moderate and conciliatory measures. By striking into a middle path between Calvinism and Arminianism, he endeavoured to reconcile both creeds. He held with Calvin that the merits of the six death are to be applied to believer only; but he sho asserted that all men are in a state capable of salvation. In his desire to conciliate all, and in the many modifications, concessions, and alterations that were extorted from him by men of different religious tenets, he sometimes incautiously showed himself to be more Calvinistic than Calvin, at others more Arminian than Arminius.

BAY, bai (Fr. baie), in Phys. Geog., an erm of the but smaller than a gulf, and larger than a creek. The term is, however, often applied to large tracts of water around which the land forms a curve, as Hud-

son's Bay.

Bay. (See Laurus.)

Bayaderes. (See Bajaderes.)

BAYBURES. (See BAIADERES.)
BAYBUX TAPESTEY, bai-yu(r), (Fr. tapis, carpet), a long piece of cloth, or rather canvas, 214 feet in length and 20 inches broad, preserved in the Hôtel de Ville at Bayeux. It is embroidered in coloured yarns, with figures of men, animals, houses, ships, &c., with a border above and below the central portion, formed of emblematic devices; and forms a pictorial history of the events which preceded and brought about the conquest of England by William I. It is divided into eventy-two compartments, each bearing an inscription in Latin explaining its subject; and many of the figures have the names of the persons they are intended to represent attached in the same language. It contains represent attached in the same language. It contains 1,512 figures in all; namely, 623 men, 202 horses, 55 dogs, 37 houses, churches, and castles, 41 ships and boats, 49 trees, and 505 smaller animals, birds, and sphinxes, principally in the borders. It is supposed to have been worked for the cathedral of Bayenz, under the superintendence of Matilda, the queen of William the Conqueror, and presented to his brother Odo, the bishop of that place, as an acknow-ledgement of the services he had rendered in the conquest of England. It went exactly round the nave of the building, where the ecclesiastical authorities, according to Ducarel, in his "Anglo-Norman Antiqui-1767, were accustomed to hang it up on John's day in every year, and allow it to remain there for the eight days immediately following: but, from

COOKS-PROM BATEUR TAFFETRY.

the inventory of the various things belonging to the cathedral taken in 1476, it seems probable that it was originally suspended round the nave on October 15, originally suspended round the nave on October 15, the day on which William won the battle of Hastings. M. Lancelot, in 1724, was the first to call attention to this elaborate piece of needlework, having found a coloured drawing of a portion of it in the library of M. Foucault, formerly intendant of Normandy. He communicated his discovery to the Academy of Inscriptions and Belles-Lettres, and showed its evident commettion with the events of the Norman conquest.

## Bayeux Tapestry

which appeared in 1730. It narrowly escaped destruction at the hands of the meb during the French revolution, and shortly after was brought to Faris, and exhibited there by order of Napoleon. When it was sent back to Bayeux it was kept rolled up on a large wooden roller, but it may now be seen, protected by a continuous of them in the public library. In 1816 continuous cases and the second of the second o covering of gluss, in the public library. In 1816 careful drawings of it were made by Mr. Stothard for the Society of Antiquaries, which were published in vol. vi. of the "Vetusta Monumenta." It has been a matter of discussion whether it was worked by Matilda, queen of William the Conqueror, or Mailide, empress of Germany, the daughter of his son Henry I.; but there is much evidence in the tapestry itself to show that it wassembroidered shortly after the occurrence of the events it is intended to commemorate. The following is a brief summary of the principal scenes in this pic-

ERRYANTS CARRYING UP DINNER-FROM BAYEUR TAPKSTRY.

torial history, which affords invaluable information to the archeologist and historian, respecting the manners, customs, costume, mode of warfare, &c., at the time of the Conquest. In the first compartment Harold is shown taking leave of Edward the Confessor prior to Blown taking learn of Normandy. He is then seen quitting Boseham, in Sussex; and, having crossed the Channel, he lands in the territories of Guy, earl of Ponthieu, by whom he is detained as a prisoner. Messengers come from William of Normandy to Guy and Harold; and the release of the latter is ordered. Guy conducts Harold to William, who brings him to his palace. Harold then renders assistance to William in his quarrel with Conan, earl of Bretagne. The flight of Conan to Bennes is shown, the attack of the Normans on Dinant, and the surrender of the town. William rewards Harold's services by a present of armour, and the two proceed to Bayenz, where Harold swears to aid William in his project of gaining the English crown on the death of Edward the Confessor. Harold then returns to England, and is shown relating his adventures to Edward, whose death occurs shortly after-wards. The people offer the crown to Harold, who accepts it, regardless of his oath to William. The appearance of a comet betokens some disastrous event likely to befall him. The news is conveyed to William who holds a consultation with Odo, and orders instant preparations to be made for the invasion of England. The embarkation of arms, men, and stores, and the bassage of the Norman troops, are next depicted; their passage of the vorman troups, are next depicted; their landing at Pevensey and march to Hastings, and the subsequent fortification of a camp, and the erection of a castle. The coming of Harold and his army is made known to William; and the Norman soldiery are shown laying waste the country with fire and aword. The approach of the hostile armies, and the results of the reconnoitring on either side, are next shown; and William appears addressing his soldiers previous to the conflict. Next comes the battle of Hastings, with the episodes of the death of Harold's brothers Lewine and Gurth, the prowess of Odo, the shughter of Harold's body-guard, and the fall of Harold himself; and the work is finished with the total defeat and rout of the Saxon army. It is supposed that it was originally in-tended to continue the history up to the coronation of somestion with the events of the Norman conquest.

This led to a search for the original, which was found in the extended to continue the anisry up to the original, which was found shruptly broken by its termination at this point, the embroidery is complete, and bears no marks of having in the work of the French antiquary Fère Montfaucon, had any portion destroyed,—Bel. Vetusta Monumente,

### Bay-Leaves

vol. vi.; Pictorial History of England; Bruod's Bayeax Tupestry Elucidated.

BAY-LEAVES.—From remote antiquity bay-leaves have been used in the customs and ceremonies of various nations. An honorary grown or wreath composed of these leaves was bestowed as a prize on men who were distinguished for any literary or military ment. Thus Spenser.—

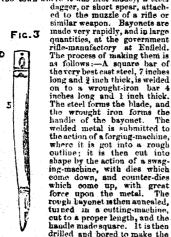

"So him they led through all their streetes along, Crown'd with garlands of immortal baies; And all the vulgar did around them throng To see the man whose everlasting praise They all were bound to all posteritie to raise."

There was a superstition that bay-leaves were able to protect the wearer in a thunderstorm. And in an old play, called *The White Devil*, there are the following lines:—

"Reach the buys;
I'll tie a garland here about his head,—
'Twill keep my boy from lightning."

The fading of bay-leaves was looked upon formerly as an omen of death. At the present day they are used along with other evergreeus in decorating houses and churches at Christmas. They are also used for flavouring in cookery.

BAYONET, bai'-o-net (supposed to be derived from Buyonne, the town where it was first made), a steel

socket-handle hollow, shaped

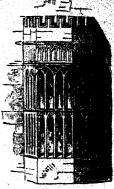

3

1

bent a little at the neck, and then hardened and tempered. Before it is quite complete, the hayonet has still to go through a variety of minor processes. The first bayonets were used in France in 1671 and were called bayonet-a-monche: they had handles which first bayonets were used in France in 1671 and were called bayonet-a-monche: they had handles which fitted into the muzzles of they mus. Bayonets -d-monited of sbort daggers, which the infantry were in the habit of slocking into the muzzles of their muskets when attacked by earaly. The use of pikes went out as the value of the bayonet began to be appreciated. The bayonet, as an oftensive weapon, has been of great importance in modern warfare; and the bayonet-charge, in which every nation thinks that it excels, is one of the most terrible mancourres of infantry soldiers. The sword-bayonet is a more modern invention, and, when detached from the gun, can be used as a weapon by itself. With respect to its different parts, the blade is shown at 1: 2 is the hilt; the quard and ring are marked & 4 is the spring which secures the sword to the rifle; the scabbard of the wespon is shown at 5.

### Beaches

BAY-WINDOW, Arch., a window which forms a bay or recess in a room. It may project outwards from the wall either in a rectangular, polygonal, or semicircular form, which latter has often been incorrectly termed a box-window. Windows of this kind are very common in the Perpendi-cular style. Examples of them may be seen in the halls of the colleges at Cambridge and Oxford, as well as in the old halls of the English nobility and gentry. Chancer makes the following allusion

BAY-WINDOW.

"With bay-windows, goodly as may be thought."

BAZAAR, or BAZAR, ho-zar', is a term derived from the Arabic, and literally signifies the sale or exchange of goods. Among the Turks and Persians t is applied to a market-place, either open or covered, where goods are exposed for sale, and where merchants meet for the transaction of business. The name has recently been adopted in London, Paris, and other great cities, and is applied to places opened for the sale of various articles, chiefly fancy goods.

Bazoche, of Basoche, ba-zosh', a French term, the exact etymology of which is rather doubtful, but most agree in considering it a burlesque translation of the Latin word basilica, a royal palace. When justice was administered in the royal palace of the French kings, the judges, notocates, procurators, and others who were connected with this department, were termed cleres de la bazoche. Afterwards, when the administration of justice became a separate department, a distinction was made between those noblemen who formed the royal train, and were called courtiers, and those connected with the court of justice, who were called cleres de la bazoche, or basochians. But as the term bazoche implied the having a king, a mock one was appointed, who had his officers of state, court, and other paraphernalia of royalty. In the beginning of the 14th century Philippe le Bel conferred on this community certain important privileges. Henry III. suppressed the title of king, and conferred the rights and privileges attached to that office on the chancellor. Still the bazoche continued to exist as a body, and retained its pomp and its forms. It met twice a week, and heard and decided all processes and debates that srose among the clerks. At public festivals the bazochians took a prominent place; and at the carnival they united themselves to the prince of fools, and took part in the setting of low farces and mysterics. In their turn they acted a kind of satirioal morality, in which they took great liberties in railing at the vices of the ago, and in insulting the favourites of fortune. This naturally produced a great outery against them, and at length, in 1540, they were entirely suppressed.—Ref. Encyclopédie des Gens du Monde.

BRELLIUM. (See BALSAMODENDRON.)
BRACH, beech (Ang.Sax.), in Geog., a shelving tract of sand or shingle washed by the sea or a freshwater lake, interspersed between the water and the land on which vegetation grows. The sea-beach is the space between low and high water-mark, particularly that part of it which is dashed by the waves; and the beach of a lake lies between the highest and lowest water-marks

of its ordinary level.

Braches, Raisen.—Banks of sand and shingle, with shells, found following the bays and recesses of the coast, at various heights above the existing beach or see-margin. These give evidence of either elevation of the land or depression of the cocan, and point to

Beacon

Beagle

times when sea and land stood at these successive levels Along the coasts of Great Britain there are several notable examples, at heights about 10, 20, 40, and even 60 feet above the present sea-level.

Bracon, bee-kee (Sax. beach, a sign; beaching, to

Bracon, bee-kon (Sax. becon, a sign; becomin, to lanks a sign to, the name given in former times to signal-fires lighted on the tops of hills or any elevation that could be seen from a great distance, to convey intelligence of the approach of an enemy, or any other desired information, by preconcerted signs. Heacontess are of great antiquity, being mentioned in Jereman vi. 1, and by the Greek tragedian Æschylus, in his "Agamemnon," as conveying the intelligence of the fall of fleoy to the Greeks. In England, the beacons were formerly piles of faggot-wood, but afterwards pades were erected, to which iron pots were attached, filled with pitch and other combustibles. Intelligence inica were erected to which iron pois worth intelligence was speedily conveyed in this manuer: the become was speedily conveyed in this manuer: the become and speedily conveyed and speedily conveyed and speedily conveyed to the control of the con the frontier between England and Scotland were always securious between ingiana and spottand were always carefully watched, and, in the reign of Elizabeth, a line of beacons was erected on the headlands and hills on the south coast, to signal the approach of the parish Armada. Lord Macaulay, in his ballad on this subject, describes in forcible language how the company of the Spottands described the southern of the Spottands described in the southern of the spottands and the southern of the spottands are supported in the southern of the spottands and the southern of the spottands are spottands and the southern of the spottands are spottands and the spottands are spottands and the spottands are spottands and the spottands are spottands are spottands are spottands are spottands and the spottands are spottands are spottands. mass subject, describes in forcible language how the names of the coming of the Spaniards' feet was flashed from Plymouth to London, and round the eastern coast, in the dark night, the red blaze of beacon after beacon springing from hill, and down, and tower, rousing the slumbering might of England into lite and action. These iron beacons were often erected on church-towers, and one is still to be seen on the tower of the parish church of Hadler in Middleser — In of the parish church of Hadley, in Middlesex.—In Mar., a beacon is an erection at the entrance of a Mar., a neacon is an erection at the entrance of a harbour orriver, to indicate sunken rocks, sand-banks, or parts where navigation is dangerous. It is generally a pole secured by chains to the rock on which it is placed, with a large ball formed of iron hoops at the top. Vessels auchored in certain places, exhibiting lights at night, are called floating beacons. The lighthouses built at various points to render navigation less hazardous are also beucons. (See Lighthouse.)

BEAD, bede, in Arch., a small moulding whose vertical section is semicircular, sometimes cut into pearls and other ornaments in Grecian and Roman architecture, in which it is more frequently used than in the
